## ERS'S JOURNAL

POPULAR

LITERATURE, SCIENCE, AND ART.

*Fourth Series*

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS.

No. 993.—VOL. XX.

SATURDAY, JANUARY 6, 1883.

PRICE 1½d.

ONE FALSE, BOTH FAIR;  
OR, A HARD KNOT.

By JOHN B. HARWOOD, AUTHOR OF 'LADY FLAVIA,' 'LOVE PENNIE,' 'THE TENTH EARL,' &amp;c.

## CHAPTER I.—COMING HOME.

'SHE is pleasing, certainly, but—strange. Perhaps mysterious would be the better word. In Egypt they called her the Sphinx, you know; and indeed there is something singular, and almost startling, in that quiet, ghostly way she has of gliding into the midst of people who believe her to be a hundred miles off. She talks well; but I always feel afterwards a vague sense of perplexity, as though I had been conversing with one whose habits and experiences, and ideas of right and wrong, were as vague to me.'

'Yes; there is something strange about Countess Louise, to our English taste, perhaps; but I am sure she is well-bred, and clever and agreeable, and means to be kind; and then—she has been everywhere, and knows every one. I find her a pleasant travelling acquaintance, Clara, love, and that is all. Once in England, we shall part company, of course. You are not very likely to see much of her at Castel Vesz, or at Leominster House either, when you are in London.'

The speakers were two slender, fair-haired girls, dressed in black, who stood side by side on the poop-deck of a great steamer, speeding swiftly on through the pale gloom of the warm night, a starry sky above, and the dusky purple wavelets of the Mediterranean rippling with soft plash, as if caressingly, against the vessel's side. There had been a broad white awning spread, as usual, over the after-deck, sacred to chief-cabin passengers; but, as usual also, it had been doily removed, when night fell, by the supple brown hands of those lithe, tiger-footed, tiger-eyed Lascars who form the majority of the crew on

VOL. XX.

board of our fast-steaming Peninsular and Oriental packets, such as was the *Cypria*, homeward-bound.

There was something majestic, something almost oppressive too, in the solemn stillness that prevailed, not a sound being heard save the wash of the dark-blue water, as the powerful engines forced the ship along; and the low hum of conversation that arose from a group collected near the cabin hatchway, some few paces distant from where stood the two girls, in their mourning garb, apart from the rest. These two were silent now; one of the sisters—for such they evidently were—looking down over the vessel's side, towards where the softly murmuring sea was dappled here and there by faint phosphorescent gleams; while the other turned her beautiful face towards the East, unconsciously as it seemed, and gazed with sad eyes along the streak of glistening foam that marked the steamer's wake.

A light yet hesitating footfall on the deck, the rustle of female dress, and then, in a low voice, the commonplace words: 'Your Ladyship! Tea is ready.' It needed not the muslin apron, the trim waist, and punctilious neatness of attire, to indicate the caste of her who uttered this little crisply spoken speech. Only a lady's-maid drilled and schooled from her teens into the traditions of the still-room, could have contrived to be at once so meekly suggestive and so softly audible.

'Very well, Pianetti; you can go the shawls,' answered one of the sisters.

'Yes, my Lady,' was the quiet reply; and the maid retired as gracefully as she had approached.

After a brief pause, the two girlish figures

moved towards the cabin stairs, near which stood the steamer's captain, bluff and genial, the light from the binnacle shining on his gold lined cap and weather beaten face. 'It's a fine evening, my Lady, and a pity to lose it,' said the tough old seaman, in his kind fatherly voice. 'We can't, you know, expect much more of the dear weather, past Malta as we are, and at this uncertain time of year.'

'We shall come on deck again, Captain Burton, thank you,' was the rejoinder, and then both the sisters moved on, cabinwards. As they passed the group of loungers congregated near the hatchway, more than one glance of mingled curiosity and interest was turned towards them, and then the hum of voices grew somewhat louder than before. With the exception of an only and differential Paces in glossy broadcloth, diamond shirt studs, and varnished boots, all the passengers (chatting together) were of British speech and nationality. There was yellow, grizzled old Major Grudge, an Anglo Indian, long since accustomed to the climate, as he told you, somewhat boastfully, after a five months' acquaintance, with fellow Mrs Grudge and his schoolgirl daughters returning for cheap education at Bruges or Bonn. There were languid sublimans on sick leave, a sergeant-major or so, a field officer or two, a stray indigo planter, the editor of a Malabar newspaper, and the movable travelling M.P., who has been out to 'do' India, and thus win for himself parliamentary prestige by asking awkward questions and tormenting optimistic Secretaries of State. There were ladies and children in large majority, of course, and with them the usual Nile country swahide, and the usual tourists, fresh from Cairo or the Cataracts.

'Very pretty, both!' drawled out a pallid young cavalry officer, whose remaining energies, sorely impaired by brandy and soda, unbidden amid the hot winds of parching Dootypore, seemed to be devoted to an attempt to swallow the massive gold head of his short whip stick. 'Hard to say which looks the best, but, for choice, I'd bet upon the one who went down first—Miss Carew.'

'Then you'd lose your wager, Sifton, I can tell you,' responded blithely-eyed Major Grudge, with a grin of contempt for the griffin's discernment. 'That was the Marchioness, as it happens, and not Miss Carew.'

'Mr Sifton's was a very natural mistake,' said good natured Mrs Colonel Green of the Ahmednuggar Artillery. 'They were twin sisters, you see, and so much alike—poor, pretty young things! A sad story, was it not, of the Marchioness being left a widow after only a year of married life out there in Egypt. Her young husband, the late Marquis, had not had the title very long, and the doctors ordered him, as a forlorn hope, to Cairo. He died there.'

'Not there, dear Mrs Green.' It was at Luxor, exclaimed another of the Anglo Indian ladies eagerly.

'At the Second Cataract, I saw it in Gazing nose,' chimed in a third member of the group.

'Excuse me,' remarked a tourist, 'I was at Khartoum at the time, and know all about it. I had met the party, too, at Elephantia. Terribly

said at the time, it was! Poor fellow—that young Lord Leominster, I mean—it was sad to see him, with his hectic colour and watery eyes, leaning on his young bride's arm, among the granite columns and painted chambers of the temples. Everybody knew how it must end, but somehow, when the worst came, everybody was shocked and sorry. Lucky that her sister was travelling with them, was it not?'

'I wonder whether she will marry again, she doesn't look twenty, and a beautiful young creature too, and as she seems now,' said Mrs Green of Ahmednuggar, with that tendency to prophetic archmangling which is innate in the best of women.

'It should be Mrs Carew's turn next,' observed the indigo planter.

'Ah, we shall see about that,' put in, more authoritatively, another passenger, little Ned Tattle, returning from Egypt to his beloved Jamyn Street lodgings and his club window, and who, on the strength of his familiarity with Pall Mall gossip, affected the air of a fashionable oracle. 'Can't expect two of a family to land a big fish, you see, like a Marquis of Leominster, especially when a gill has not a sardine. A wonderful match that, for the daughter of a poor Devonshire baronet like old Sir Felford Crew. I remember old Sir Felford quite well. And then there's the present man, Sir Fagin, the brother of these young ladies, still more out at elbows, if possible, than his father before him. It sounds grand, don't it, Carew of Carew, but what's the use of pedigree and that sort of thing, without the coin to back it?' added Tattle, whose grandfather had been a fashionable fishmonger in the Poultry, E.C., but whose own name often figured at the big end of printed lists of guests at Macbeth House, Mandeville House, and elsewhere.

'But she will be well off—the Marchioness of Leominster, I mean?' asked one of the company, half timidly deferring to Tattle's superior information as to the ways and means of the aristocracy. A man who spoke so disrespectfully of baronets, and whose tone in talking of a Marquis was one of good humoured patronage, was pretty certain of commanding deference for his opinions among colonial self exiles, homeward bound.

'Why, yes, rather,' answered the Pall Mall philosopher, with a secret delight in being listened to. 'You see, young Leominster—poor fellow—the late Marquis was very much in love, and happened to have unusual power over the property. His widow gave Castel Vawr, the show-place of the family, on the Welsh border, and a heap of money besides. Thirty thousand a year at the least of it, or more likely thirty-five, the Castel Vawr rent roll must be, and I'm not sure that Leominster House, Piccadilly, and the London house property, do not belong to her too—for life, anyhow. Only the Lancashire estates, which are strictly entailed, go to the heir. I am speaking of the present Marquis of Leominster, Adolphus Montigomery—see called him Dolly, and thought him a muff—second-cousin to poor Wilfred that died.'

On this subject, one or two further observations were made. It was told how the late Marquis's yacht *Ferry Queen* was on her way back to England, having on board, too, the remains of

her noble owner, and it was plausibly conjectured that the owners had chosen the longest Southampton route, as enabling them to avoid the stir and bustle of the land journey from Bremen to Marseilles. And then the conversation flowed into other channels, and the group presently broke up.

## HINTS TO YOUNG WRITERS

THE following hints—they pretend to be nothing more—are offered to those who desire to cultivate the art of composition. Not that the best instruction in the world will of itself make an author, any more than it can make a painter or a sculptor. Something more than mere teaching is needed. When Oppo, the painter, was asked by a young student what he was in the habit of mixing his colours with, he replied grimly 'With brains, sir.' And he was right. Here we have the first requisite for success in the higher arts, Composition among the rest. Those who have no 'brains,' no intellectual power, had better let pen and paper alone. But even those who have a fair share of power must know how to use it. They want practice, and they want training, and the training which they cannot get from others, they must be willing to give to themselves. Those, however, who are in earnest about making the most of their powers, are usually glad to avail themselves of the experience of others, and it is for this reason that the following pages are written. For although it is not possible, in one sense, to teach composition, it is possible to point out certain errors that should be avoided, and certain objects that should be kept in view, with the best method of attaining those objects. And since all the suggestions that we have to offer upon these points are founded upon experience, it is hoped that they will afford help to those who may be trying to help themselves.

To begin then. What is it that you wish to do? You wish to express your thoughts in writing, for the benefit of others. But 'out of nothing, nothing comes,' therefore you must first have thoughts to express. First the thought, and then its utterance, first the matter, and then the manner. The subject falls naturally into these two divisions.

First, the thought. It is strange that we should require to learn even to think, but like many another strange thing, it is true, and anything that helps us to think wisely and truly is not to be neglected. We shall find that there is no greater stimulus to thought than contact with other minds, and this comes to us mainly through conversation and through books. It is true that real conversation, the keenest of intellectual pleasures, the most stimulating of intellectual exercises, is but seldom to be had. And yet now and then, in the course of our lives, we are so happy as to meet with a companion who has this power of conversation, as

apart from all fragmentary gossiping. And the result is startling. We are no longer the same persons that we were. Some change has passed upon us. Not only have we found a friend, but we have found ourselves. It has been truly said that one of our great wants in life is 'somebody who shall make us do what we can.' And until this want is satisfied, we know not what we can do. But when we meet with this 'somebody,' we find ourselves in a new world. It is as if our mind took fire at his mind. We are 'taught the whole of life in a new rhythm,' we are 'lifted into that mood out of which thoughts come that remain as stars in our firmament' for ever. Whence come they? We can not tell. Up to this moment we have had no such thoughts. But for this companionship, we had not had them now. Yet they did not originate with our friend, but with ourselves.

Probably Socrates was the first to recognise this result of sympathetic intercourse. It is to this that he refers when he calls himself the midwife of men's thoughts. De Quincey and Emerson both insist strongly on this benefit of conversation, and it was probably something of the same kind that Charles Lamb had in his mind when, after speaking of the death of several friends, he said 'And now, it is so many parts of myself I have lost the market!'

But such intercourse is rare. It is probable that it comes but seldom to any of us, while to many it never comes at all. Consequently, we are obliged, for the most part, to seek for our mental stimulus to books, which are more or less accessible to us all.

And what will books do for us? Why are we to read them? Not for enjoyment merely, not only in order to store the memory with facts, nor even to train the mind with the thoughts of great men. We read them and we value them for all these reasons, but they have a higher use still, namely, the education of the powers, the cultivation of the mind, the formation of the character. 'No la,' says Emerson, 'art for nothing, but to improve.' The mere transference of the contents of a book to our own mind will do us little good unless the mind, besides receiving, acts upon what it receives. The food of the mind, like that of the body, is intended to be digested and assimilated, to nourish and to result in growth and increase of power. If I am to be in no way better when I lay down my Plato or my Shakspere than I was when I took it up, I will not read at all. Why should I? But if I have held intercourse with 'a soul that made my soul wiser,' then indeed my time has not been wasted.

The amount of reading that is profitable will vary with each individual, and it depends upon the mind's receptivity and power of assimilation. It is of less importance to read much than to read wisely and well. Wisely—that is, to read exclusively good authors, and well—with the reasoning power, the imagination, and the affections awake and on the alert.

We are, then, to read for our own mental and moral culture, we are not, as a rule, to read in order to write. It is true that in some cases,

such as in preparation for literary work done 'to order,' this is inevitable. But all will agree that the best work is not done in this way. It is the subject which we have studied for its own sake, whose interest and value have driven us irresistibly onward, on which we shall be best able to write, and thus not merely on account of our better acquaintance with it, but from the interest which we take in it. It is extremely difficult to interest others in anything in which we are not interested ourselves.

Obvious as this consideration appears, it is frequently overlooked, if we may judge by the unreadableness of much that is printed both in periodicals and books. The writers of such unreadable matter may have said to themselves: 'This subject will make a marvellous article, or even a book,' they did not say 'This is a subject of interest; if I put it to use, I must need try to make its value as clear to others as it is to ourselves.' This is the spirit in which we ought to write. If we cannot show to our fellows something that we see, and that they would be the wiser and the happier and the better for seeing we need scarcely write it all.

If the choice of a subject is still a difficulty, it may be well to inquire wherein the difficulty lies. It is possible that the questions which interest you have no attraction for your acquaintances, and being resorted to loneliness in your pursuit of them, you deepen of meeting with sympathy from your readers. But it is certain that, however lonely you may be in your own circle, you are not alone in the world. That which you care for, others care for. What is of value to you is of value to them. Therefore—Mr Hunt, the American artist, says to his pupils—'Find out what you can do, and do it. Follow your own individual taste, and somebody will appreciate it.'

Or perhaps your favourite subjects are old and true words. This is natural enough, for everything that is of purely human interest, and therefore of special interest, is as old as the human race itself. And yet it is just these subjects that are never exhausted. They possess the secret of perpetual youth. And for this reason, the things themselves present new aspects to each generation, and consequently are capable of a fresh representation in literature. The literature of each generation possesses some characteristic peculiar to itself, but these depend less upon new subjects than upon new views of old subjects.

You have now, we will suppose, decided upon your subject, and are sitting, pen in hand, prepared to begin to write. At this point you will find yourself face to face with an important question. That question is not, 'What can be said upon this subject?'—for doubtless much may be said which is not worth saying, nor is it, 'What do I think about it?'—for possibly you may never have thought about it at all, or your thoughts may be mistaken. But ask in all honesty, 'What is the truth about this matter?' And the answer to this question, if you are so happy as to find it, will be something worth saying.

We come now to our second point—the utterance of the thought. You know now what it is that you want to say, you have next to

consider how you will say it. The all important thing here—that which you must keep inexorably in view—that to which everything else must give way, and which must itself give way to nothing—is accuracy. Do not be tempted to imagine that one word is as good as another. On the contrary, it is either better or it is worse. Change the word, and you may perhaps change the idea. If one word expresses your meaning, then any other word may express something that is not your meaning. Many young writers are harassed by a morbid fear of tautology, and accordingly they collect a number of words that they believe to be synonyms, and use them alternately. Such a system is fatal to accuracy. Why should a word shirk its duties merely because the word has been used before? It may often be necessary to use the same word several times in one paragraph, or even in one sentence. Under such circumstances, console yourself with the reflection, that tautology proper consists less in the recurrence of words, than in the repetition of ideas.

You are resolved, then, to be accurate. And the next point to consider is clearness. The simplest words will serve you best, for you are writing in order to be understood by others, and unless you can strain this primary object, your labour will be thrown away. Your readers, especially if they be hasty ones, will misunderstand you if it is possible, it is your part to see that this shall be impossible. Brevity and conciseness you will find valuable means to this end. If you wrap up your meaning in many words, you will conceal it, your object, remember, is to lay it bare to the public eye. You will find it a good plan to read over your composition when you have finished it, and to strike out every unnecessary word. Above all, avoid redundant adjectives. They are merely the disguise under which weakness seeks to conceal itself.

Others, again, are captivated by some trick of words. A resounding sentence carries them away, an alliteration strikes them as impressive. Some are afflicted with this fatal faculty, they pour forth a torrent of words with no discoverable object. For all these, the remedy is one and the same. Bear in mind that your sole object is to tell the truth about your subject, or that portion of the truth which has revealed itself to you, in such a way as to be understood by others. Other considerations are secondary.

But it may be said, are accuracy and clearness to be our only objects? What becomes, then, of beauty of style? Here we confess that we can give no rules. Beauty of style is the result of the special powers of the individual. In this, nothing will so much avail you as the study of great authors. Read them from pure love of them. 'Bathe your spirit'—as Charles Kingsley beautifully expresses it—'in their noble thoughts, as in May dew, and feel yourself thereby, if but for an hour, more fan.' Give yourself up to their influence—drunk in the spirit of their writings, and feel yourself thereby lifted into a purer atmosphere, better able to see and feel truth yourself, better able to make others see and feel it too.

And next, you may pass on to analyse their special beauties. Acquaint yourself with Shakespeare, study his marvellous creations, his

## HINTS TO YOUNG WRITERS

enliven thoughts, has great and varied powers of expression. Take down your Dr. Quarey, and learn the resources of your mother tongue. Compare Hazlitt's clear, cool, and somewhat hard English with the delicate grace and humour of Charles Lamb, or with the earnestness and enthusiasm, the manly vigour, and the tenderness no less manly, of Charles Kingsley and Dr. John Brown. Study Macaulay. The style of these men is not the expression of the mind merely, but **the** whole character. So is it always. It rests, therefore, in a great measure with ourselves whether our style shall be good or bad. To this point we shall return presently, only adding here, that the permanence of our work is almost entirely dependent upon the quality of the style. What we say may be very valuable, but unless we say it as well as it can be said, a day will come when some one else will say it better, and our work will be superseded.

You will probably find that your powers of expression vary from day to day, or even from hour to hour. At one time your thoughts will come to you clothed in language so appropriate, that you hesitate to commit them to writing, lest they should escape you. At another, every sentence is a labour. But that labour you must make up your mind to bestow. If a particular sentence is especially elaborate, it is sometimes a help to withdraw the mind from this or that form of expression—for difficulty of expression is sometimes the result of a vagueness of conception—and to ask yourself some such questions as these: What is it that I am trying to say? What do I mean? **Is** this false, it may be well to pass on and proceed with the essay, but the offending sentence should be stored in the mind, and by no means allowed to have its own way. Generally, you will find that in a day or two the idea takes shape of itself.

The opening and the concluding sentence of your composition will generally cost you the most labour. Upon this point it is not easy to give advice. One hint we may offer. The particular topic with which you are occupied is certain to be a branch of some other and wider subject. A slight sketch of the general subject makes a good introduction to that division of it which you have chosen for your composition. But above all, spare no pains. No excellence can be attained without work. Do not be tempted to say of anything, 'That will do.' It will not do, if you can make it better. And this is a lesson especially needed by those who have talent. There, if they are willing to work, they doubtless do better than others who are gifted, but the chances are that they will do worse, because they will imagine that for them work is unnecessary.

If you cannot begin your essay gracefully—if, that is, you can think of nothing that is at once true and suitable, plunges boldly into your subject. Anything is better than spinning fine sentences about nothing. And the same remark applies **to** the conclusion. When you have finished—stop. Nothing is more pitiable than to see an author who has exhausted his ideas—not to speak of his readers' patience—wandering through mazes of meaningless verbiage, in the hope **of** stumbling upon a concluding sentence.

A graceful conclusion is undoubtedly desirable for the completeness of composition, but it may be dispensed with, if it is beyond your powers. If you cannot complete your composition, wait and work until you can.

After all that has been said about beauty of style, it is perhaps unnecessary to caution you against any approach to slang. Have you any love at all for the English language? We will hope that you have, for certainly no one ought to write who has not. Then remember that the preservation of that language in its purity depends largely upon those who take in hand to write it.

When you have finished your composition, you will naturally be anxious to judge of its merits. It is commonly assumed that we can form no reliable judgment of our own work, as much at least is implied in the usual advice to young writers—namely, 'Read over your composition, and strike out all the sentences that you consider particularly good.' And although this is an extreme suggestion, it is not to be denied that a young author is hardly the best judge of his own work—that 'I am's fondness for the child also bears' is apt to mislead the judgment. It is well, if possible, to have a second opinion. If, therefore, you have a friend on whose judgment you can rely, you will find it an advantage to consult that friend. But unless you know your friend's opinion to be valuable, and unbiased, do not ask it. The suggestions of incompetent persons will only perplex you.

Perhaps the last method of testing your own work is the following. When your composition is finished, when you have done all that you can to make it perfect, put it away for two or three months, and forget it as far as possible. Meanwhile, pursue your reading of history, science, philosophy, poetry, and what not, still confining yourself to the best authors in your particular line of study or taste, and you may be inclined during the interval to write one or two papers on fresh subjects. As a return **to** the one you have laid by, its defects will strike you as forcibly as if it had been written by somebody else. And the process which you have had in the interval will enable you to remove the defects with greater ease. Even experienced authors are often glad to keep a finished manuscript for a time, before sending it to the printer, especially if it is on an important subject, and has been struck off in a hurry.

As we took occasion to point out in this *Journal* for Jan. 29, 1881, you must not be too much discouraged if, at the outset of your career, you find that no editor will take your productions. You honestly think that they are as good as any that you see in print, and you may be right. You are tempted to wish that you had friends at court, that, for example, you had the good fortune **to** number an editor among your relations or intimate friends. Well, a day may come when you will derive lively satisfaction from the reflection that you had no such interest, and that your success is the result of your own unaided exertions. In any case, do not be in too great a hurry to print your productions, you will very likely see cause to alter your opinions, in which case you would regret having published them.

If neither editor nor publisher will have any thing to say to you, redouble your efforts. Resolve that you will persevere until your offerings prove either that you are not adapted for literary work, or till they are so much above the average that they will command attention. Really first rate work is not apt to be rejected. But even if your compositions are never to see the light, make it a rule to finish them as carefully, and in all respects to work as well, as if you were writing for men kind and for all time.

Our treatise on composition would be incomplete if we were to leave untouched the subject of originality. We all wish to be original, and so far this is well, but originality is not to be had for the asking, nor even for the trying. Our object—as has been already said—is to put before others something that we see and feel, and to do this in our own way, in the way that is, which is natural to us. And just so far as we succeed in doing this, shall we be original. If a number of persons group themselves round any object, each one of them will see it at a different angle, the difference being the result of his point of view. So each one of us can see truth from his own point of view, and therefore see something that others are not in a position to see. This much of originality is open to us all. A poet gains his view from his own point of view and from that of others as well. In his power he differs from other men, but his object is the same as our own, namely, first to see and then to make others see.

Again, if we allow ourselves to acquire a habit of exaggeration, it will kill it once upon our composition. Even more fatal is the habit of catching up fashionable phrases, 'expressions' as they are called. Surely we can be at the pains to clothe our thoughts in words that will fit them, instead of concealing their proportions in a ready-made garment that barely covers any thing worth the name of a thought.

Socrates used to tell the Athenians that the foundation of all real knowledge was 'to understand the true meaning of the words that were in their mouths all day long.' The meaning of the words we use is often very different from our meaning. If we would only make up our minds every day and always, to say what we really mean, and to say it in words that will convey that meaning accurately, clearly, and forcibly, we should find the practice an invaluable aid to composition. Be chary also of the use of italics: if due emphasis cannot be given to your words without frequently underlining them, be sure you have missed the true art of literary expression. At the same time, there are occasions upon which italics are invaluable. But let caution mark their use.

We would add another caution to young writers. Many of them are disposed, by way of appearing clever and deep sighted, to assume a cynical or cynical style in the treatment of their subject. Our experience of such attempts is that they are, almost without exception, ignominious failures. A writer of satire is one who requires much knowledge of life, and of human character and habits, and has besides a special eye for recognising the seamy side of things. Young writers who seek to emulate or even to imitate the style of such men as Swift or Fielding, Thackeray or

Dickens, generally, before many sentences are written, manage to betray their own impotence of life, or their incapacity to judge adequately of what they would hold up to censure, while their defective literary expression tends to expose themselves to the ridicule which they seek to hang down upon others. We would repeat to young writers, shun satire and cynicism if you would shun almost certain defeat.

In concluding these rambling hints, we would again press upon literary aspirants the necessity of industry and patience. The power of good writing is not acquired—except in cases so rare as to be quite out of account—without the expenditure of much thought and labour, and even after articles are accepted by an editor—which is not infrequently done on grounds apart from their merely literary character—they may require to be subjected to much alteration and revision. As this revision is generally done by men of experience, the young writer would do well to note the changes; in every case, by comparing the draft of his finished manuscript (which he should preserve) with the article as it appears in print. This would afford him a better means of self-judgment and self-correction than the reading of a dozen treatises on the art of composition. In this way, also, he would be able to ascertain somewhat of his own weakness and strength, and the particular directions in which these lie, and if he be not too self-opinionated, be sure in the end to profit by the comparison.

## FOR HIMSELF ALONE

A TALE OF REVISED ENGLISH

BY ALISTAIR

CHAPTER I

THE room was the second floor back of a certain house in a certain shabby street in the suburbs of London. It was a good sized room, and had two windows, the outlook from which was not a very lively one, being limited to the back premises of sundry other houses, which, as a rule, formed the playground of innumerable children during the day, and the try-in' place of innumerable cats during the small hours of the night. On fine days, vistas of drying linen might be discerned flitting far into the murky distance.

The furniture of the room was worn and shabby with age and much hard wear. The faded carpet was darned in many places, and patched in others with pieces different from itself, the hearthrug was worn threadbare with the usage of many years, the glass over the chimney piece was cracked, and its once gilt frame was blackened with age. There was a horse hair sofa between the windows, to sit on which was like sitting on a plank, and there were several cane-bottomed chairs, most of which were more or less rickety and insecure. The two comfortable easy-chairs, one on each side of the fireplace, belonged to the present tenants of the room, as did also the writing desk that stood opposite one of the windows, and the oval table that was fixed near the other. There were several hanging shelves laden

# FOR HIMSELF ALONE

with books, and magazines and newspapers were strewn carelessly about. On the walls were several sketches in water colour, and some half dozen caricatures in chalk. Finally, the room had three doors, two of them opening into bed rooms, and the third giving access to the common staircase of the house.

The time was seven P.M. on a pleasant evening in May. On the horse hair sofa was stretched at full length a young man of some five or six and twenty years, on whose features the traces of recent illness were plainly visible. A magazine had dropped idly from his fingers, and he now lay perfectly still, watching a glint of dying sunlight as it slowly mounted higher and higher on the opposite wall. His face, without being markedly handsome, was a pleasant one to look upon. His expression was one that seemed to mingle refinement of thought with devotion of character. His eyes were particularly good—dark, grave, reflective, yet with a playful gleam in them at times which seemed to show that he had not left his youth so far behind him as not to be able to enjoy a little fun or nonsense in due season. His complexion was olive, and his hair black, and from top to toe he measured six feet and a little over. By profession he was a writer for sundry newspapers and magazines, a sort of guerrilla trooper attached to no staff or corps in particular. His name was Frank Froisher.

Before the gleam of sunlight had quite faded from the wall, the noise of footsteps ascending the stairs was heard, accompanied by the sound of a mellow voice crooning forth the refrain of the last popular song. Then the door of the room was opened, and the new comer halted for a moment on the threshold.

"What a boar I must be!" he exclaimed. "For the moment I had forgotten that you might be sleeping. Have I disturbed you?"

"A good thing if you had. I seem to have been snoring my brains away of late."

"How do you feel by this time?" asked the other as he came forward and shut the door.

"Oh, better—better," was the answer, given a little quaveringly. "The doctor says I am better, so I suppose I must be."

The new comer, Dick Drummond, was a tall, lanky, buckled young man, about the same age as his friend, or it may be a year or two older. He had dark blue eyes, that seemed made to express fun and mischief rather than any deeper shades of feeling, but which yet could be tender enough on occasion. His long straggling red hair looked as if the tonsorial art would improve its appearance. He wore a slouched hat, and a brown velvet jacket that had evidently seen better days. He was an uncombed genius in the great world of Art, a punker who painted more pictures than he could sell. He and Froisher were bosom friends, and shared the second floor back between them.

"What have you there?" asked Froisher, noticing that his friend was laden with sundry parcels and packages.

"Item—one half quarter loaf, and next a beauty!" answered Drummond solemnly as he proceeded to place his packages one by one on the table. "Look at that crust, there's a piece of form and colour. Item—half pound of prime Dorset, as sweet as a daisy. Item—four ounces

of the best mixed tea. "I like a wholesome dish of tea."—Dr Johnson item—two bloaters, gone to Yarmouth, and no mistake. Item—one ounce of Kumata for your especial behoof. Your pipe has been idle too long, old fellow. Item—one bottle of prime old claret port, to be taken medicinally as often as need be."

"But how on earth did you raise the money to buy all these luxuries?" asked Frank, a little anxiously.

"Old Samuels stood me a fiver for my 'Andromeda.' The la la la. He had turned to the cupboard by this time, and was emptying the packet of tea into the little caddy.

"Dick, the truth is not in that," answered Froisher after a pause. "There's a postcard from Smokers on the chimney piece. He declines to give 'Andromeda' however soon at any price."

"More idiot he," answered the unabashed Dick. "He doesn't know a word of genius when he sees it. Those wretched dealers never do. Mark my words, that picture will sell for a thousand guineas before I've been a dozen years under the hammer."

Dick went on with his preparations for tea, turning, at the tray and arranging the cups and saucers, stirring up the fire—for the May evening was chilly to the invalid—and putting the little kettle on to boil. For economy's sake, the two young men washed upon themselves as much as possible.

"Richard, what are you five been sinking your mind the points for," said Froisher after a minute's silence.

"Not for the first time in my life, nor for the last, I hope. But what does it matter to you what I've been? (Has must live."

"But one can live without pink old crusted port, especially in the present state of our finances."

"And I say we can't, at least you can't. The media has ridden you wise, and wine you shall have."

"Dick, you have been passing your mother's tin."

"What if I have? There was nothing else left that I could get a decent advance on. I had no more pot-broth ready, and I'm afraid they wouldn't have advanced much on the manuscript of your last di."

"Ah, Dick, I shall never know how to repay you. But you ought not to have pawned the ring."

"But I say that on that. If my mother were alive, she would be the first to applaud me for doing so—under the circumstances."

Frank could only shake his head. He had no strength to sign the point.

"Thanks," went on Dick, "there's poor Tom. I'll only just out of the hospital, and that pretty little wife of his without a shilling to bless himself with. The poor thing quite broke down when I began to talk to her, and then he confessed that neither she nor Tom had touched food since yesterday."

"Dick, perhaps you did right after all to pawn the ring. But what a wretched lot am I!"

"The la la la!" sang Dick. "Another week or two will set you on your pins as right as a travel, old boy. Confound this little!" It doesn't even sing yet. Won't you try one of these Yarmouth blowers?"

'No, thank you. Nothing but a cup of tea.'

'With a thin slice of toast nicely buttered. Many's the slice of toast I used to make for the pater in the old days at home.'

Frank lay back languidly on his cushions while Dick went on with his preparations for tea, whistling under his breath as he did so.

'Supposing it's a bright warm day to-morrow,' said Dick presently, 'how jolly it would be to take a holiday.'

'I should like it above all things,' answered Frank. 'I feel as if I had lived among brackles and motor cars for years.'

'We might take the train as far as Richmond, hire a boat at the bridge, and paddle up stream for five or six miles, then land, and dine at some old-fashioned river-side inn.'

'That would be capital.'

'After dinner, we would lounge in the shade of some big old chestnut—they are all in bloom just now. And then, while I did a bit of sketching, you should think out the plot of your next story, and in the cool of evening we would take boat again and drop quietly down the stream, and finish up the day with a few naves and some bottle-d'arrest.'

'Quite an idyllic sketch, Dick, especially the oysters and stout. But—'

'But no no buts. I've got the ready here, my boy—here,' answered Richard the impulsive as he tapped his waistcoat pocket with a joyous air.

'But think of our debt. Four weeks' rent owing.'

'Together with one or two other titles not worth mentioning. I think, the more deeply am in debt, the more I enjoy a holiday. Seem as if my creditors were standing treat, you know how kind on these points.'

'Suppose we defer our holiday, and pay a fortnight's rent with the money?'

'Not a bit of it. Old Dibbeluck is in no want of money. He's rich, my boy, rich, and can afford to wait. I only wish dear old Leyland were here to go with us.'

'And as to I, with all my heart,' responded the invalid.

'But he is in Tisbury by this time,' went on Dick, 'trying to put those wooden chairs that seem to have put on a different shade every time you look at them.'

Hence Leyland was a brother of the brush who tenanted rooms on the floor above those occupied by our friends. Although twenty years older than either of them, he was as young at heart as they, and when he was at home they were all chums together. At present he was away on a painting tour in the neighbourhood of the Land's End.

At this moment, a slatternly maid of all work, after a preliminary tap at the door, intruded her head into the room and announced 'A gentleman to see Mr. Frobenius.'

'Show him up, whoever he may be,' answered Frank languidly.

'And just as this bluster was done to a turn,' sighed Dick.

'The banquet must be postponed.'

The slatternly servant opened the door, and ushered in a little dapper elderly gentleman with a keen but good-natured face, whose sharp grey

eyes seemed to take in the room and its occupants at a glance.

'Bug pardon. Trust I'm not intruding,' he said. 'But are these the chambers of Mr. Frank Frobenius?'

'This is my room, sir, and I am Frank Frobenius.'

'Not all, I hope—Good gracious! that will never do,' exclaimed the stranger. 'But I must explain that I have called to see you on a private matter of great importance.'

'I have no secrets from my friend, sir. Whatever you have to say, may it be said openly before him.'

'In that case, sir, allow me to introduce myself. My name is Gump—John Gump, attorney at law, and in old acquaintance of your lamelled father—that is, if you really are Mr. Frobenius the younger.'

'I really and truly am Frank Frobenius the younger, and I still retain a very clear recollection of you, Mr. Gump, although I have not seen you since I was eight years old.'

'I flattered, I am sure. Good memory, great acquaintance,' said the lawyer.

'Before you go any further, Mr. Gump, I must introduce you to my friend—the only friend I have in the world—Mr. Richard Drummond Dick, Mr. Gump, an old friend of the family.'

'Charmed, I am sure, to make Mr. Drummond's acquaintance,' said the little man. 'And now, Mr. Frobenius,' resumed the lawyer, putting on his business air, and looking at the young man keenly, 'if your memory carries you back so far, may I ask when and where you recollect having seen me before?'

'At Chisna, my father's old house.'

'True—very true. I was often there. Do you recollect any peculiarity in connection with the drawing room at Chisna?'

'Let me think. Do you refer to the hiding-place in the chimney that was one day discovered accidentally by my father?'

'I do. One more question. Can you tell me the name of the lady who was governess to your sister?'

'You mean Miss Jukes?'

'I do.'

'Mrs. Jukes, whom I one day caught you kissing in the shrubbery?'

'Excuse me, Mr. Gump, he called out Dick from the fireplace. 'The kettle had boiled at last, and he was making the tea.'

'Oh, eh. Confound it!' I had quite forgotten that little incident,' answered the lawyer as he blew his nose in some confusion.

'You gave me half a crown not to tell,' went on Frank. 'And next day you advised my father to send me away to school.'

'I did, I did. Dear me! what half-forgotten memories your words bring back. You must be your father's son, Mr. Frobenius. May I ask whether you have any family documents in your possession?'

'I have a heap of old letters and papers in a box in the next room. But why do you ask all these questions?'

'With your leave, I will examine the papers in question to-morrow, and not keep the news of your good fortune from you any longer.'

"The news of my good fortune!" exclaimed Frank, while a sudden flush mounted to his forehead. Dick, with the grin on his hand, turned his head to listen.

"Do you remember your uncle, Mr Timothy Askew?" asked Mr Gump with most provoking coolness.

"Mr Askew was my father's half brother. I have often heard my mother speak of him, but I never saw him."

"Mr Askew went to India when quite a young man. He remained there thirty years, and was on his voyage home when he died. He had made his will five years previously, and deposited it with his bankers. By that will, you are declared Mr Askew's sole heir and legatee. Your income will be something like eight thousand a year, and I congratulate you very sincerely on your good fortune."

For a moment or two Frank could not speak. "I my uncle hear—the heir of a man who never even saw me!" he exclaimed at last. "Eight thousand a year!"

"Enter the fury godmother Dick, used as an official lawyer," murmured Dick to himself. "Frank will hardly care about a blunder to his tea now. Poor sausage at elevenpence a pound would hardly be good enough."

Mr Gump took snuff very noisily. "It seems like a dream. I can hardly believe it true," said Frank after a pause.

"But for all that, it is perfectly true," responded the lawyer with a smile. "Well—very pretty little place in Surrey, which Mr Askew never lived to inhabit—will now own you for its master. But we can go into all needless details to-morrow."

"It seems incredible—like a tale out of the Arabian Nights—How long has my uncle been dead?"

"Six months. He died a fortnight after leaving Calcutta—A pretty job I've had to hunt you up, Mr Frobius. Who would expect to find the heir to eight thousand a year in a gutter in Soho?"

Dick took up his hat and crowded the room. "I never believed in such tricks from India till to-day," he said. "I've seen more than one of them on the stage, but I never heard of one in real life till this afternoon. Frank, old fellow, I congratulate you with all my heart."

The hands of the two friends met in a long hearty grip.

"Where on earth are you off to now, Dick?" asked Frobius.

"I'm just going out for a little while, old man. You and that gentleman have a lot of things to talk over, so I thought I would step round the corner for half an hour and nab a little of something, and pull myself together a bit, for you're going to be a regular swell now, Frank." There was a ring of pathos in the honest fellow's voice as he spoke thus, with his soft felt hat clutched between his strong fingers.

"If you dare to stir a step beyond that door, I'll never speak to you again," cried Frobius as he started to his feet. "Put down your hat this moment, and pour me out a cup of tea."

"And I will take a cup also, if you please, Mr Drummond," said the lawyer.

Dick flung his hat across the room, and pro-

ceeded to do as he was told, whistling softly to himself as he did so. He set me cup of tea before Frank, and another before Mr Gump, and then poured out some for himself into a small basin, the tea service in the Soho lodgings being strictly limited to two cups and saucers.

Meanwhile, the lawyer had resumed his conversation with Frank. "Yes, sir, a pretty chase I've had before I found you," he said. "It's only two hours since I obtained a clue to your whereabouts, and I lost not a moment in coming to see you. I just dropped in upon your uncle, Mr Frobworth, as I came along, and told him the news. He was overjoyed."

"My uncle overjoyed at your finding me?" exclaimed the young man in an unmistakable tone of sarcasm.

"He really was. He himself has been most indefatigable in his efforts to find you."

"I can quite believe it, now that I am rich. He was equally indefatigable in his efforts to shun me so long as I was poor."

"Beg pardon, but you do Mr Frobworth an injustice, I'm sure you do."

"Then I beg Mr Frobworth's pardon. But you must remember, Mr Gump, that I speak from bitter experience."

"You have doubtless been poor, Mr Frobworth, and poverty is like a cheap looking glass, it distorts everything that is reflected in it. I expect Mr Frobworth here, to congratulate you in person, in the course of a few minutes."

Frank started to his feet, an angry light spark hazed in his eyes. "Mr Frobworth coming here? The first man in the world whom I should care to see!"

"And yet Mr Frobworth is your nearest living relative," said the lawyer drily.

"Because I have the misfortune to be his nephew, is that any reason why I should like him or care to see him?"

Mr Gump's reply to this question was a pinch of snuff.

Frank took a turn across the room, and then returned to his seat. "Look you, Mr Gump, he began twice when Mr Frobworth was a young man and ruin stared him in the face, he was saved by my father's helping hand. Time went on. Thanks to the fact that then given him, Mr Frobworth grew prosperous and well-to-do. His fortune overtook my father, then came illness, then death. His last words to my mother were, 'Frobworth will take care of Frank,' his last act, to write a few lines recommending me to my uncle's care. After my father's death, the lines thus written were sent by my mother to Frobworth. No answer. Then my mother wrote twice still no answer. We struggled on, my mother and I, as well as we could for several years. Then my mother fell ill, and after many months of suffering, she died. Night and day through all that dreary winter I hid myself. All other occupations had no way to that. The morning my mother died, a lot of bread and a few shillings were my only earthly possessions. Everything available had been sold or pawned weeks before. Then I bethought me of my uncle Frobworth—no one said just now, my nearest living relative. I wrote, told him everything, and asked him to send me the means to bury my mother. An answer came by return

of poet, in loony—what think you?—is) a very rich! I say, sir, forty shillings was all that Algernon Peabworth, Esquire, could afford to throw away on his dead sister, and had it not been for the generous help of my friend Drummond, my mother's remains at this moment would be lying in a pauper's grave. That very week, my uncle's name appeared in the Times as the donor of five guineas to a fund for the relief of the sufferers from an earthquake in South America. The Pharisee—the vile Pharisee!

'Hush, sir, hush! What you have said both pains and surprises me,' said Mr Gump. 'I have always had the very highest opinion of Mr Peabworth.'

'Keep your opinion as you wish, but let it—only let me keep mine. I tell you that now I am rich, this man will fawn on me and flatter me and be as servile to me as any spaniel, and that because gold is the only duty he has ever learned to worship.'

'You are very bitter, Mr Frohisher, for so young a man.'

'Poverty is a stern schoolmaster. She has taught me lessons which I can never forget.'

Mr Gump rapped his knuckles on the table. 'You are a little while no one as yet.'

Suddenly Mr Frohisher turned to his friend. His face had brightened a little, and there was a grimly humorous smile on his lips when he next spoke. 'How would it be, George, if you and I were to exchange identities for a couple of months?'

'Eh?' answered Dick with a start, not comprehending what Frank had said. He had been thinking somewhat sadly that their old friendship could never be again quite what it had been. Frank would be a great swell now, and every thing would necessarily be changed.

Frohisher's next words were spoken with a slow clear emphasis that could not be misunderstood. 'Suppose that for the next two or three months you become Frank Frohisher, and I become Dick Drummond?'

Dick only stared and shook his head. Had his friend taken leave of his senses, he asked himself.

'Surely, Mr Frohisher, you cannot mean your strange proposition to be taken seriously, and the lawyer with a look of utter consternation. He too began to wonder whether this strange young man could really be in his right mind.'

'I was never more serious in my life,' replied Frohisher. 'What I propose is, that my friend and I shall for the time being change identities. He shall take my name and position, I his, and I rely upon your assistance and connivance, Mr Gump, in carrying out this scheme.'

Mr Gump took a pinch of snuff, and shook his head in emphatic disapproval of any such madcap idea.

'I am going among a set of people,' resumed Frank, 'into a circle of relatives, of whom I know little or nothing. As a rich man, I shall make their acquaintance at a terrible disadvantage, I shall never really know them, never see them without the mask each of them will wear before me.'

'Let me study them for a few weeks from behind the scenes, as it were. As Dick Drummond, the amanuensis, the secretary, the humble friend of the rich Mr Frohisher, I shall see many a slip

of the mask, have many an opportunity of judging as to the real feelings and sentiments of my new-found relatives.'

'A strange scheme this of yours, Mr Frohisher, a very strange scheme, and I must really decline to have anything to do with it,' said Mr Gump solemnly.

'It is like the rich uncle from India,' remarked Dick, 'one of those things you hear about in plays or novels, but never meet with in real life.'

'My dear Dick, there are stranger things happening every day in real life than any novelist or playwright dare make use of. As for this scheme of mine, mad as it may seem at first sight, I am determined to carry it out. Dick, I can rely upon you, I know!'

'Of course you can, old fellow. I'm yours to command in any way and every way.'

## MONDAY AT HER MAJESTY'S TOWER

On Mondays, as well as on Saturdays, the Tower of London is visited, free of charge, by all the world and his wife. All the world's baby goes too, in arms—the inevitable baby that attends all excursions of home-loving Britons, and must be brought out when the trouble-tired wife is anxious for a holiday. The number of babies sent to the Tower is the most remarkable feature of a fine holiday-making Monday there. We meet them on the long paved approaches that lead from towered gateway to gateway, we meet them in the Horse Armoury, in presence of two rows of knights in panoply of war, impenitently staring from the arms of a stern quiet awe-stricken mother, at the fierce of the warriors, or stretching and crowing for a steel-clad soldier as for the moon—a better picture any day than the bird's nest in the cannon's mouth! We meet them up stairs in the Armoury, overcome by monotony and the smell of oil, and tyrannically screaming the order to their carriers to move on. We meet them in the dungeons, calm and speculative, and complacently ogling the rubble walls, even where once an imprisoned life died out in long protracted, unspoken misery, or where there has many a time been heard by lantern light the voice of human agony and the creaking mechanism of torture.

In the Jewel Room, too, we meet the babies, cocking round eyes contemptuously towards the crown of the realm and the little mountain of gold and jewels. And at the foot of the staircase thither, where a chair is placed—perhaps for the restoration of the suffocated who have braved the foul air of the upper room where those glittering temptations are kept in prison—we again see the inevitable baby rocked happily on the knee of a poorly dressed young mother. Is it a fairer sight to her than all the splendour of the Jewel Room up stairs? Is it more precious than the whole hull of crowns and bangles, and the wealth of beaten gold that must have been a month ago uneasily glared to her eyes? Is the blazing crown of England worth her baby to the heart of her who hugs it under the poor pleated shawl? We hope the heart will have the right answer ready, but we are afraid to speculate in this and London, and needless to say, we do not ask, but we might be subjected to

an exact account of the number of his teeth and a description of his 'taking notice wonderful for his age'—which, no doubt, he did in the Jewel Room, with that contented cocking of the eye, or he must have been a *blond* baby, ready for anything, and past being astonished.

For interest to the crowd, nothing can vie with the jewels—except the dungeons. Within an immense round glass screen to keep out the dust, and a barricade of iron bars to keep out the hands, is spread tier above tier such a vision of gold as exists nowhere else out of the Arabian Nights, and at the top of all lies, bright with superb jewels, the crown of the noblest Lady in the land. All round this huge cage, the eyes and noses are loyally and admiringly peered between the bars, and the glittering glory within is not to be spoken of in common language or inspected save with reverent eyes. 'Ay! look at the font, all gold! whispers *Materfamilias* in front of the article of her choice. 'My eye! what a jug! what a young unicorn with his head almost stuck between the railings, to which his mother replies reprovingly. 'Don't say *jug*! that's a *flagon*! 'Oh! come along! roar half a dozen Cockney youths, boisterous with the gregarious boisterousness of the Cockney in his teens, with swagging gait, brilliant neck ties, and low felt hats. 'Come out o' this to where the men on horseback is!—'And the cannon and the cannon balls!' cries another, while they sweep down stairs like a hurricane of boots. The unmounted cannon in the open ground are the delight of this description of go ahead young men, and the Horse Armoury is his compendium of medieval war and chivalry, and the illustration of all his talks of knightly adventure.

Has our young Cockney read *Don Quixote*? Has he heard of the Crusades? Has he done battle with the Saracens in imagination? Has he any glimmering vision of tournaments and courtly pageants—of the bloodstained Red and White Flower, and valiant Margaret of Anjou? We are afraid he has not. But he has read of Sir Conspicuous in the penny paper, and of Jack the apprentice who runs away to the wars, wears the lilt of Sir Bangwyl de Beumont, in full armour, in the very month of the enemy's artillery, and after a terrible case of anachronism, rescues the Lady Armadilla, with the raven hair and violet eyes, runs away with her by stealth from the wicked Baronets' feudal castle, and marries her by torchlight in 'cloisters, just in time before the terrible Sir Conspicuous, swearing vengeance, arrives upon the scene armed cap à pique in steel, and *revolver* in hand! Some such historic association as this the young Cockney carries with him into the Horse Armoury. Did not one of them—for our indirect instruction—point out a gauntlet to his companions as 'a what d'ye call it? a *glove*, yes—that then a *page*! And we knew instantly that he was thinking of that touching passage in *The Knight of the Dragon Caques*—or some such tale, but these romances are too grand for memory—where Jack the hero casts his 'mailed glove' down before the miscreant who appeared to the hand of his lady love, and cried 'Be this my gaze, &c.,' and the miscreant, doffing his plume, took up the gaze, and said 'Come on, thou dunder!' Hence, with the power of generalisation natural

to genius, for the students thereof, a glove of steel becomes a *page*.

In the Horse Armoury, the ladies are partial to the mahogany faced little Prince Charles in full armour. They stand before that staring boy, who looks, buried in awkward accoutrements, as uncomfortable as a wooden boy could look, and they chorus in whispers about his looking nice, till we don't wonder that his wooden visage has 'served for ever a pale mahogany or terra cotta blemish. Other ladies ejaculate 'Noble creature!' but whether in reference to the varnished and polished horses or the wooden faced warriors outside thereon, they leave undecided. One of the countless crowd of respectable, comfortably dressed working men and sailors, has a different opinion at least about one of the mounted heroes, for he criticises the cumbersome armour of blind King Hal as he would a suit of clothes, and looking at the metal laden horseman, votes it 'a doosed ugly set out!' But remarks made aloud are rare. In the long Armoury, under the amber and purple light of the small windows, and advancing up a metallic vista, with ungainly helmeted horsemen in endless array, among a confusion of the debris of medieval battle, a scene of awe bushes the nightseers, they look with awestruck faces and talk with bated breath, as they do in no other public exhibition—not even in cathedral aisles. Those that reverently admired the Crown Jewels are still more abashed before the charge of labelled steel cavalry. They hunt over yonder that it was a swindle to show them a model of the Koh-i-noor, and that it 'blant much to look at! But there are no irreverent remarks in the dim Armoury, no shadow of incredulity is provided even by the startling placards that bid us believe that those weapons of Charles II a time are the 'spears of pikemen' eighteen feet long. How has our army degenerated since the days of those giants! But though the announcement is made again and again, we hear no light remark upon so startling a subject.

According to the Armoury whose modern weapon is at the end, the crowd wanders through the dread passages made between pillars and walls of upright gun barrels. One is struck by the truth of Longfellow's simile in his verse on the Springfield Arsenal, where too,

From floor to ceiling  
Lies a huge organ now the burnished arms

Or rather a hundred hues, or, more marshalled in close ranks, a huge fire on a library's hands to draw from their keys the terrible war music, the 'loud trumpet and dismal war-relic.' Other weapons are fashioned into such numerous but insignificant devices as the Prince of Wales's wedding cake, or 'the man can made of bayonets and springs of iron.' It is here among the dark armours, in the atmosphere of oil, that the dismal character of Her Majesty's Tower begins to oppress the thoughtful visitor. He goes down, deep down to the dungeons, with a proper sense that the sky far away is murky, that the river outside is muddy, that life is miserable for the majority of mankind, and that himself is an undetectedometer. This dismal question settles down upon him as a product of the atmosphere of Her Majesty's Tower, after several experiments,

we traced it to the Armoury where the kn organ arrangement of firearms is kept, and w put it down scientifically to the want of th knowledge of the principles of window make: and ventilation in ancient days, and to the act upon the nervous system of an overpow collection of gun barrels, what sightseer, an polishing oils.

Down in the dungeons, the Cockney becom kalicious. He laughs aloud, and at last sees his ordinary sightseer, demagogue. Girls dar under the temporary wooden staircases, playing Hide and seek, and though cannon balls ar heaped where the rack was worked, as if the spot of bygone agony were too terrible to trace elsewhere all the world and his wife y, rooms the racking dungeons, and make merry, utter: unable to realise the meaning of its name a horror, and in the awful dungeons beyond, into which prisoners were lowered from the top of day young men look up the dimmed sloping shaft and turn away with a grin of self congratulation. Nor is there much thinking done in the more lightsome prison rooms, though there is some talking and pointing to inscriptions on the wall. 'You see,' says a woman, 'they didn't well know what to do with themselves.' Truly they do not. But few understand that these scrawlings on the walls are the written witness to prolonged and intense human suffering: that one it least died here—wasted away in this very room, the sight of his wife and child denied to him, his whom dost they earned down the steep stone stair outside, where the crush of nightmen comes twisting up now, and where the jail are laughing and clucking, the rope that hangs down the centre pillar to help grimly clamber.

Outside, between this prison and the great White Tower, red coated soldiers are manoeuvring to a bugle call, and on the cannon, lying close packed and unmounted, the Monday visitors are gossiping, and sitting down to luncheon, or peeling oranges. They have seen the place without any of its horrors, or any of those historic visions that quicken the pulse and give more than a vulgar interest to old walls. Thank heaven for the nineteenth century! That buff outer with his red embroidered coat, and broad round hat gay with drops of colour, might have stepped out of less gentle times, but see! there, is with the briefcase a dark and dingy helmeted policeman in the Sixteenth Century talking with the Nineteenth! And outside the muddy green grown moat, beyond the outer wall, we shall find the busy narrow streets of London, the ware houses and *cafés* creeping close up to the tremendous pile of ramparts and towers. And out there beyond the southern wall, where those tiny of masts are travelling, there are the ships, the steam power, the crowded wharves of the nineteenth century, and the grey river has snuck away from Her Majesty's Tower, leaving it high and dry, just as civilisation has shrunk in course of time from such crannies as these walls witnessed when the Tower was place and prison. Thank heaven again for the quiet days of Her who owns, by right not only of blood but of justice and kindness, that bright crown in the Jewel Room, the days when all the world can wander through the fortress, and see in it nothing but the grandest curiosity, or, more,

intelligently, the finest historic monument of England, the days when only fire buckets are lowered into the dungeons and kept there, and when the awful Traitors Gate is mostly used by sparrows, those knowing birds finding it useful as a roost for chirping the river news, and convenient for popping into an undisturbed muddy nook after their meals upon the wharves.

### SOME MATRIMONIAL ECENTRICITIES

There is no end to the matrimonial extravagances that are continually being perpetrated. What strangely assorted couples you meet every day in the street—in private life—everywhere! There would almost appear to be no kind of congruity of which examples could not be found—no kind of disparity, physical, intellectual, or moral, which, if an obstacle to union at all, has not been overcome.

Extremes of many kinds are so common that we need not particularise them here. Unless on the theory of the saying that 'extremes meet,' it is by no means easy to account for some of them. Here is a somewhat curious, though far from unpleasant, illustration, which was communicated to us some time ago by a lady who had just returned from a voyage to India with her husband in the vessel of which he was skipper. The cook, a negro, was a general favourite with all on board, and in the course of the return voyage, not only our lady friend, but all the passengers, and the crew as well, became deeply interested in Simbo's matrimonial affairs, for nothing afforded the honest fellow greater delight than to talk of the pretty little English wife who, he said, was waiting to welcome him on his return to England. Some, especially the ladies, were disposed to be sceptical, suspecting that Simbo was either romancing, or indulging in one of those elaborate equivocations in which the negroes stand delight. The president of the *Deakona* and *Othello* notwithstanding, the idea of a nice looking, English girl actually falling in love with and marrying Simbo was not to be accepted without considerable reserve in the restricted community on board a vessel, small matters are often invested with an altogether exceptional importance, and so the question of Simbo's wife was magnified into one of the great problems of the day. It was at length resolved, in order to satisfy the general curiosity and put the story to the test, to have a party of some sort on board ship as soon as London was reached, and invite Simbo to bring his wife, who, he declared, resided there. The party was arranged accordingly. The long talked-of guest of the evening duly appeared.—'And, would you believe it!' the captain's wife afterwards remarked with great animation—'she was actually pretty!' Simbo was the hero of the hour, and everybody declared that a prouder husband, or a more happy, contented, and devoted little wife, had never been seen.

The very act of marrying at all is in some instances a most eccentric proceeding. What, for example, could be more absurd than the worst marriage, in a small agricultural village in England, of a couple whose united ages came to a hundred and fifty-eight, the bridegroom being twenty-seven, and the bride eighty-one! Nor

was thus the only peculiar feature of this extraordinary union. The bridegroom's Christian name was Thomas, and the bride's Mary, and thus was the third Mary that Thomas had selected as his partner, while it was also the third Thomas to whom Mary had been united by the conjugal bond. To crown all, both were in receipt of parochial relief to the extent of two shillings and a loaf each per week.

A hardly less extraordinary wedding is reported from Charlotte, North Carolina, being that of a blind girl to a man who was deaf and dumb. It was not to be expected that such an event would escape the observation of fastidious Western journalism, nor did it. A local paper took occasion to point out that by this marriage each of the parties would acquire an opportunity to put on little pantomimic scenes from which ordinary married folks were entirely debarred. When they quarrelled, for instance—the wife being unable to see, while the husband could not hear or speak—he could hurl at him broadside after broadside of steel pointed invective, and the poor man could but stand there, study the motion of her lips, and fondly imagine she was telling him how sorry she was that anything should come between them. He, on the other hand, could sit down, shake his fist, and make hideous grumaces, all the while thinking he was sitting with his face buried in her hands, and hot remorseful tears steaming from his eyes.

One of the most remarkable matrimonial complications on record occurred a few months ago in Long Island, New York. A married woman who felt her and approaching, and who was solicitous as to the fate of her six children, implored her husband to marry her younger sister, she being the only person fitted in her eyes to take charge of her family. The husband promised to act in accordance with her wishes immediately after the funeral, and the sister also undertook to fulfil her husband's wish. The sick woman, however, was not satisfied. She feared they might not prove so good as their word, and entreated them to give her the consolation of knowing that her children would certainly be cherished after her departure. Worn out with her importunity, and thus being studiously no hope of the poor woman's recovery, they finally consented to be married at once. The ceremony accordingly took place, and so much comfort and satisfaction did the invalid derive from contemplating the future of her little ones, that she speedily recovered from her illness, and gave cheering proof of her convalescence by turning her sister, bag and baggage, out of the house.

Some very eccentric matrimonial arrangements are occasionally brought to light in our courts of law. A singular illustration occurred in London the other day of the extraordinary views that often prevail among people of a certain class as to the way in which private agreements affect marriage. The parties in the case in question were a porter and a cook, who had married on the express understanding, embodied in a formal agreement, that unless and until the latter should arrive at the following accomplishments—namely, piano, singing, reading, writing, speaking, and deportment, the 'said marrying' was to be no more thought of, and considered null and void. The pair were regularly married, and as the lady

did not master the required accomplishments, continued to live apart for fourteen years, the husband fully believing that 'the female of us' as the woman was denominated in the agreement, was not his wife. When, however, the case came up for decision, the judge was of a different opinion.

Marriages which are not in themselves in any way peculiar are sometimes rendered very much so by the eccentric manner in which they are gone about. We recollect a wedding at which the happy pair had no sooner been united than, to the amazement of every one except the officiating clergyman, who had been let into the secret a few minutes before, the eldest brother of the bride advanced with one of the blushing bridesmaids, and requested that the ceremony should be repeated for their behoof. It appearing that all the necessary legal and other preliminaries had been duly arranged, the demand was complied with, and the company had to celebrate two weddings instead of one.

This recalls the case of an enterprising Scotch widow, who, failing the appearance at the eventful moment of her intended second husband, utilised the occasion, the clergyman, and the company in a way which must call forth the admiration of the most skilled diplomatist. She was a bouncing young widow of twenty-five, and had agreed to marry 'No 2' as she playfully termed him, in a year and a day from the demise of 'No 1.' The happy day fell on a Wednesday, and the ceremony was to take place at the bride's house. A magnificent wedding feast was provided, and about sixty guests invited. The hour fixed for the marriage was six p.m. In the forenoon, the bridegroom arrayed himself in his best, and went off to invite a few friends in the country who had been overlooked. Whether he happened to take with him a copy of the *Pickwick Papers*, and came across Mr Walker's famous advice to his son Sam on the subject of 'widows,' will probably never be known, but by this or some other means, he appears to have been reduced to a peculiarly vacillating state of mind with regard to the important step he was about to take, for by the afternoon post his bride elect received from him an intimation to the effect that he had conscientious scruples as to marrying a woman so recently widowed. He would make it a matter of careful consideration, and abide by the result of his subsequent feelings. She was not to take this as a positive declination, but if he had not arrived by six o'clock, she might consider the marriage off. The widow did not either faint or go into hysterics, but dashed herself in her bridal robes, and smilingly received the guests who had been bidden to the feast. When all the company had arrived, the lady read to them the communication she had received from the recalcitrant bridegroom. Loud and long were the denunciations it elicited, and the heroic bearing of the widow under such trying circumstances was marked and commended by all. 'This need not prevent the feast,' she said, and the banquetting began. The dancing over, the room was cleared for dancing, and everything went as merrily as if the wedding had passed off under the most favoured auspices. The result of it all was that an elderly bachelor, who had opened the ball with the irrepressible widow, became so enamoured of her, that before the

evening was far advanced he had proposed, and, what was more, had been accepted. The minister was recalled, and at eleven p.m. the wedding, though not the one for which the guests had been assembled, was solemnized. The ceremony had scarcely been performed, when the door bell was violently rung, and in stalked the supercilious bridegroom. 'Careful consideration' had at length overcome his 'conscientious scruples,' and he had come back to claim his bride—only, however, to be introduced to her as the wife of another. Served him right.

Marriages by electricity is one of the latest novelties which have been introduced on the other side of the Atlantic. The first wedding of this kind took place last year at the cantonment in the Red Lands, Dakota; the clergyman officiating from a place called Bismarck, many miles away, by telegraph. The bride and bridegroom responded to the electric marriage ceremony at one end of the wire, in the presence of witnesses, while the correspondent of the *Phoenix Press* and several other witnesses saw the clergyman perform his duty at the other. The questions and answers were written, telegraphed, and responded to, and the blessing was pronounced in the usual form, and 'aired' with perfect accuracy. All present at both ends of the wire, it is reported, were much affected towards the close of the ceremony, and the whole affair created general interest.

Shortly after this, the telegraph was again brought into requisition for purposes matrimonial, but on this occasion its use was a merely accidental contingency in the execution of a still more eccentric matrimonial trick. The notion in this instance was to be married on the summit of a high mountain known as Pike's Peak. At sunrise on the eventful morning, the bridal party set out, mounted upon mule horses, on their romantic errand. Before they had proceeded far, a some what untoward accident befell the Reverend Doctor who had been engaged to perform the ceremony. He had been mounted upon a particularly lively animal, which, after walking along the road for some distance on two legs, wound up his performance by putting the unfortunate clergyman over a fence and into a stream. He was soon fished out, but, though not seriously injured, the mishap altogether deranged the plans of the wedding party, for the reverend gentleman not unreasonably declined to risk his health by continuing the trip in his dripping condition, in spite of all persuasions and the offer of a safe and quiet animal. After some consultation, a brilliant idea suggested itself to the bridegroom, which was, that the clergyman should proceed to the nearest city—Colorado Springs—and from the United States Telegraph Office, which was connected with the signal station on the Peak, perform the ceremony by telegraph. The Doctor ultimately consented to this arrangement, and thus another element of romance was added to the undertaking. The summit of the Peak was reached about noon. The sergeant in charge of the station was greatly delighted with the notion of a wedding in his elevated retreat, and entered into the spirit of the thing with enthusiastic good will. The instrument room of the signal station was decorated with flowers and flags, and the sergeant sent a call down to the Springs office, some thousands

of feet below. The officer in attendance replied, informing the sergeant that the Rev. Dr. Smith had arrived and was ready to proceed with the ceremony. The young people joined hands and stood before the sergeant, the father and mother of the bride standing, on each side, and the sergeant at the instrument read off the questions of the clergyman as they were delivered by the subtle wire. There was a rapid clicking for a few moments, and then the sergeant in a solemn voice repeated the message: 'Charles A. Dutton, do you take Nellie J. Thoremorton to be your lawful and wedded wife?' 'I do,' responded the bridegroom with evident emotion. The sergeant tapped the instrument, and in another moment the message came: 'Nellie J. Thoremorton, do you take Charles A. Dutton to be your lawful and wedded husband?' 'I do,' said the bride, in a low voice. The sergeant heard it, however, and transmitted the reply. There was a moment's pause, and then, up the mountain came that message making two hearts one: 'Then I pronounce you man and wife.'

The news of this romantic wedding was circulated far and wide, and graphic accounts of it duly appeared in nearly every newspaper in the United States, under such headings as 'Wedded on Pike's Peak,' or 'Two hearts made one by telegraph ten thousand feet above other people's heads.' Thus of course set many young people who were about to be married a thinking whether they could not contrive something equally romantic or out of the way, and before many days were over, a very fair attempt was made to rival the Pike's Peak affair. A Kentucky couple hit upon the expedient, not of ascending a mountain to be married, but of descending into the bowels of the earth for that purpose. The company, which included a Louisville clergyman, drove over the hills to the Mammoth Cave, and boldly entered the great black yawning cavern. An extremely narrow part of the tunnel, known as 'Fat Man's Misery,' was successfully passed, the bride, as well as the rest of the party, being obliged to crawl along on hands and knees. 'Green River,' with its blind fish, was safely ferried over, and, after a long and adventurous underground tramp, the spot selected for the wedding was reached. 'There,' says a glowing account, 'under nature's glittering geyse, with darkness filling the depth beyond, and torches weirdly lighting the immediate spot, the clergyman did his duty.'

#### AN INDIAN SNAKE DANCE

THE MOQUIS are one of the many Indian tribes which dot the vast plains of Western America. Lieutenant T. V. Keam, who for many years has acted officially under the United States' government among the Indians, gives the following account of a curious ceremonial which he and others witnessed some time ago at a Moqui village in the north-east of Arizona. The history of this strange festival was related to Lieutenant Keam in the most picturesque language, by an ancient chieftain of that tribe.

In an age of the distant past, the Moqui Indians lived on the San Juan River. Their Chief, greatest in wisdom and daring, resolved to learn what became of the vast body of water that

ceaselessly flowed through the country. Con-  
structing a raft, he stored it with provisions to  
last him for many moons, launched it on the  
San Juan, to be carried by its swift currents  
whithersoever they went. After encountering  
many perils, he entered a large water, on the  
shores of which great rocks elevated their fronts  
to the stars. Driven ashore, he ascended to the  
top by perilous paths, and found them inhabited  
by a family of Indians, who received him with

and most beautiful maiden for his bride, whose  
charms long rendered him forgetful of his own  
people, but the words of his father called him,  
and obedient to his call, he, with his wife, started  
for home. Immense dangers beset their path,  
but the guardian spirit of his kind led them  
through every peril safely to his people, by  
whom he was received with the pride and wonder  
of his race.

But unfortunately for the Moquis, jealousy  
rankled in the bosom of their women. A foreign  
woman possessed the heart of the sturdy and  
brave of their tribe. Subjected by them to every  
indignity that wicked ingenuity could devise, and  
too proud to make known her grievance, the  
bride, determined on revenge, gave birth to a  
brood of serpents, and the charmed ones of  
which neither the arrows nor bullets of the  
Moquis could avail. The Moqui children were  
slain by their deadly fangs. The people, pursued  
by this terrible foe, fled from the land of their  
fathers, till, on reaching the country in which  
they now dwell, a mighty serpent lashed their  
pursuers to atoms, and commanded the Moquis to  
possess his hills and valleys, and to live at peace  
with all his kind. In gratitude for their deliv-  
erance, the wise men of the tribe established  
the Snake Dance as a religious rite. If a year,  
no serpent has been killed by that tribe, nor  
Moqui bitten who follows the teaching of the  
snake priests.

Such was the chiefman's history of the fight.  
The following is Kiam's narrative of the snake  
dance.

Preparations for the dance, which we witnessed,  
had been in progress for eight days. The snake  
priests, forty-two in number, devoted the first  
four days to secret rites. The four succeeding days  
were employed in capturing the snakes, which  
haunt the sandy plains around the *puddles* (villages).  
With a wand, pointed, and bearing at one end  
two black eagle's feathers, the priests crawl  
the heads of the snakes as they coil in the  
sand. The snake priests are supposed to have  
borrowed this idea from the habit of the eagle,  
which, when capturing snakes, is said to charm  
them to comparative helplessness by hover-  
ing over and fanning them with a rapid and  
peculiar motion of its wings. Having secured  
a sufficient number of the reptiles, they are car-  
ried in sacks to the *estufa*—the council house  
of the Moquis. This chamber is an excavation  
in the solid rock from nine to ten feet deep, by  
eighteen feet wide and twenty feet long, covered  
with poles, mud, and stones. Hung on the walls  
are fantastic groups are highly ornamented moons  
and, beech-cloths, waistbands, rattles, and tortoise-  
shells. On the morning of the dance, we were

granted admission to the *estufa*, and on descending  
by a ladder from the centre of the roof, we found  
the snakes, from one hundred and twenty to one  
hundred and fifty in number, contained in large  
oval earthenware urns. Some after we had  
entered, a ceremony was gone through by those  
of the priesthood who were present. Pouring  
the living mass out of the urns, they, with  
their wands, drove them around the floor of  
the *estufa* from east to west, and then around  
an altar in the rock floor two feet from the  
west wall of the building. This altar was coloured  
vividly in squares, and on each of its four sides  
a snake was painted in natural colours. Around  
it lay stone implements, knives, axes, arrows,  
brassers, a large mortar and figures of small  
animals in stone, as well as a number of the eagle  
feather wands, one of which is placed beside  
the altar where a snake priest dies, remaining  
there until the chief priest declares that the  
departed one is happy in the spirit-land.

The priests all wore a white, beech-cloth,  
and moccasins fringed with red beads which,  
their faces were painted, from forehead to mouth,  
black, from an ointment over the chin, white, their  
bodies, pink, their arms and legs dyed a dark  
brown. Around the right leg, below the knee,  
was attached an ornament made of tortoise-shell,  
together with the horny part of a deer's hoof,  
which in the dancing which followed produced  
a sort of humming, rattling resembling the noise  
of a rattlesnake in anger. During their dances  
in the *estufa*, the priests drank freely from a  
large urn containing medicine water.

The Snake Dance itself took place about four  
o'clock in the afternoon. A cotton wood grove  
had been erected on the rock near the *estufa*,  
with a single buffalo robe and firmly round it,  
leaving a small entrance on one side. Around  
this was traced a mystic circle thirty feet in dia-  
meter. Within the grove the snakes were now  
deposited in rows. The dancers were twenty-four  
in number, the remaining eighteen priests being  
employed to receive the snakes from their hands and  
to chant during the progress of the dance. The  
dancers first advanced towards the grove wands  
in hand. Then wheeling round, they separated  
twelve a side, and formed in line, representing  
the two sides of a triangle, of which the grove  
was the apex. The eighteen followed, dividing  
equally, and facing the dancers, while all joined  
in a wild chant, accompanied by a continuous  
sounding of the above mentioned rattles. The  
chief priest then advanced to the entrance of the  
grove, bearing an urn of medicine water from  
the *estufa*, two large sea shells, and two stone  
figures of mountain lions. Chanting in a mono-  
tone, he stood for about ten minutes waving the  
urn in the air. Another dance and chant fol-  
lowed, upon the conclusion of which, the nearest  
priest on the right entered the grove on hands  
and knees among the writhing and ludicrous mass,  
soon reappearing with a large snake in his mouth,  
its head and tail twisting about his face. Being  
taken by the left arm by a fellow priest next  
him, the was led around the mystic circle. The  
snake was then dropped on some sacred corn-  
meal which the squaws had scattered within its  
bounds. Immediately on falling, the creature  
coiled in anger, whereupon one of the eighteen  
carried its head with his wand and took it in

his hands. The ceremony was then repeated by the other diners, who, entering the grotto on hands and knees, brought out the snakes in their mouths: sometimes two at a time, and danced round the circle on the rocks with them, until the whole had been taken from the grotto and placed in the hands of the attendant priests. The snakes were then thrown, a writhing mass, into a pile of corn meal, upon which the whole priesthood rushed pell-mell to the pile, and seizing them in their hands, divided into four bands, tore wildly down the rocky slopes of the mesa, and liberated their captives in the smoky on the north, south, east, and west sides of the village.

### WOLF CHILDREN

As supplementary to our article on Wolf children (No 977), we are favoured by an Anglo-Indian surgeon with the following touching incident.

Ratnapore is a small civil station seventy three miles north-west of Allahabad, and was the seat of the Nana's first chuck by Havelock. The American Presbyterians had and have a Mission there, with Orphanage attached, and this was my charge as civil surgeon in pre-military days. The Mission and Orphanage were presided over by the Rev. Gopinath Naudy, an old man, who fell subsequently into the rebel Mowatt's hands at Allahabad, and was only saved from death by British General Niles' force.

To this Orphanage was brought by the police, early in 1877, a child, which they declared had been found in a wolf's den among the ravines of the Jamma, and I was summoned to see it. I objected with alacrity, for here was a proof in point of what at school we had been taught to regard as fabulous, the suckling of Romulus and Remus by a wolf. This human cub was a native child about six or seven, filthy in aspect, disgusting in odour and habit, with matted hair, and timid suspicious face. Mr Naudy told me that the child had no speech, though not dumb, would wear no clothes, and would eat nothing placed before it. Its efforts to escape were in vain.

Confounded with this wretched object, I placed a hand on his head, and said a word or two of kindness in Hindustani, but got no response beyond a kind of cackle. The poor child was evidently a burden to the Padre, who knew not how to manage it. I recommended non-interference, with lots of straw and blanket, and a gradual introduction to civilized food, cooked bones being the present substitute. At my request I found dismay on the worthy Padre's face, nothing would succeed with the wolf-cub, and the whole establishment was upset in looking after him and preventing escape. I found him wandering about the garden. On seeing me he ran up and seized my knees, and then the one vocable of his language, *scowped* him as he looked upwards at me, and that was "sig." The memory of home and home-food had dawned upon

him as he lud at my feet a handful of the weed *Poon* *outcast*! I again patted him, and spoke kindly to him, but in vain, the burden of his replies, or rather cackles, was *sig*. Taking the hint, I recommended *sig* and rice as his diet, and strange to say, it succeeded, and opened further the floodgates of mammy, for the words *sig* (*father*) and *lamma* (*mother*) now occurred in him. But the diet, simple and nutritious as it was, proved fatal to him, insupportable diarrhoea set in, and under its wasting influence, affectionate doubt returned. I could not get away from him except with difficulty, and repulsive though he still was in sight and odour, my heart yearned for the poor outcast, now fast dying. At the last moment, he tried to grasp my knees, and was ecstatically pleased when I placed my hand on his head, for he lay quite still, breathing out his life. Suddenly with a shudder the word "sig," escaped him, and with that password on his lips, he set out on the great unknown!

### SNOW FLAKES

There was the chilly winter morning,  
Through the gloomy veil of mist  
Came the snow flakes thickly falling,  
Hushing everything to rest—  
Every window sill and hearth,  
And the stones beneath the feet,  
All a pall of perfect whiteness,  
Covered all the silent street.

Seen the feet of busy people,  
Treading to their daily toil  
Trod the whiteness out and marked it  
With the gray stains of soil.  
Till the trampled snow presented  
But a sail and a useful sight—  
Pursued in its wrecks I contrast  
With the snow of yesterday.

In the chilly winter morning  
Came a little wind one day,  
Soft as any mountain daisy  
Grown, so its bed of clay  
Trod the feet that shone above it,  
Loose the limbs that in it lay,  
And we knew then that the snow flakes  
Had the morning sun had risen.

Seen the living feet of Faunon  
Trod the soil and beat it down,  
And a useful hand defiled it  
In the markets of the town.  
Till the face he lost its beauty  
And the limbs grown worn and thin,  
With the wretchedness that follows  
In the deadly track of sin.

Balled snow is never whitered,  
Never can be fair again,  
But there is a purifying  
For the sinful souls of men,  
And the print of evil footsteps  
In the downward path we tread,  
May be blotted out for ever  
By the mercy of our God.

J. J. BURNES WYLLASTON

\* *Sig* which with us is the specific native word for speech is among natives the generic term for various plants and plant tops. Tender grass and young shoots and a host of plants unknown to us as food, are classed under that term.

## CURIOSITIES OF THE TELEPHONE

GRAT inventions are often conceived a long time before they are realised in practice. Sometimes the original idea occurs to the man who subsequently works it out, and sometimes it comes as a happy thought to one who is either in advance of his age, or who is prevented by adverse circumstances from following it up, and who yet lives to see the day when some more fortunate individual gives it a material shape, and so achieves the fame which was denied to him such is the case of M. Charles Bourdelle, who in 1854 proposed a form of speaking telephone, which although not practicable in its first crude condition, might have led its originator to a most successful instrument if he had pursued the subject further. Bourdelle is now a superintendent of telegraph lines at Auch, in France, and, in recognition of his primitive idea, has lately been enrolled as a Chevalier of the Legion of Honour.

It was believed by most people, and even by eminent electricians, that the speaking telephone had never been dreamed of by any one before Professor Graham Bell introduced his marvellous little apparatus to the scientific world. But that was a mistake. More than one person had thought of such a thing, Bourdelle among the number. Philip Reis, a German electrician, had even constructed an electric telephone in 1864, which transmitted words with some degree of perfection, and the assistant of Reis asserts that it was designed to carry music as well as words. Professor Bell, in devising his telephone, copied the human ear with its vibrating drum. The first iron plate he used as a vibrator was a little piece of clock spring glued to a parchment diaphragm, and on taping to the spring on the telephone at one end of the line 'Do you understand what I say?' the answer from his assistant at the other end came back immediately 'Yes, I understand you perfectly.' The sounds were feeble, and he had to hold his ear close to the little piece of iron on the parchment, but they

were distinct, and though Reis had transmitted certain single words some ten years before, Bell was the first to make a piece of matter utter sentences. Reis gave the electric wire a tongue so that it could stammer like an infant, but Bell taught it to speak.

Bell's telephone was first exhibited in America at the Centennial Exhibition in Philadelphia in 1876, and in England, at the Glasgow meeting of the British Association in September of that year. On that occasion, Sir William Thomson pronounced it, with enthusiasm, to be the 'greatest of all the marvels of the electric telegraph.' The surprise created by its first appearance was, however, nothing to the astonishment and delight which it aroused in this country when Professor Bell, the following year, himself exhibited it in London to the Society of Telegraph Engineers. Since then, its introduction as a valuable aid to social life has been very rapid, and the telephone is now to be found in use from China to Peru.

But while the telephone conveys the vibrations of the voice with singular fidelity, it does not do so with the same perfection as the human ear, so that a given voice is slightly changed when heard through the telephone from what it is when heard from mouth to ear. The drum of the telephone is a flat plate, which has a fundamental note of its own, and it is more ready to vibrate in response to this note than to any other. Thus, the bass tones in the voice, which harmonise with this fundamental note, come out stronger in the telephone than the overtones, which do not, and hence a certain twang is given to the speaker's voice, which depends on the dimensions of the plate. Thus, for men's low voices the plate of a telephone should be larger than for the shriller voices of women and children. This peculiarity of the instrument was amusingly illustrated at the Paris International Electric Exhibition of 1881, by Professor D. E. Hughes, the discoverer of the microphone. As a member of the scientific jury who were reporting on the various exhibits in telegraphy, he was examining—along with his

colleagues, comprising several eminent foreign electricians—a telephone apparatus devised by Dr Werner Siemens, but they could not make it answer to their voices. Various names of foreign savants were shouted into the mouthpieces of the telephone, but it would not respond. At length, Professor Hughes, who is an accomplished musician, stepped forward, and acerbally ascended the fundamental note of the telephone by tapping its plate. He then turned to his fellow-jurors with a smile, and remarked that there was a peculiarity about this telephone: it was an Anglophile, and would only respond to the honoured name of Faraday. The jurors naturally treated his words with amiable derision, but this, however, was soon changed to wonder when, after crying over the names of Siemens, Ohm, Volta, Ampère, Franklin, the telephone remained obstinately uncertain until he pronounced the magic syllables Faraday, to which it joyously responded. The word Faraday had simply been spoken by him in the same tone of voice as the fundamental note of the telephone plate.

The comparative feebleness of the voice as reproduced by the telephone has often struck observing persons. With the Bell telephone, it is necessary to hold the ear close to the diaphragm to hear any sound at all. Nevertheless, Mr Edison has constructed a little voice mill, termed the Rotophone, in which a metal plate not only vibrates out and in under the impact of the voice, but at the same time sets in motion a small toothed wheel by an escapement, and can thus be made to perform work. This is in truth an ingenious method of bridging over the distinction between words and deeds. Moreover, it suggests possibilities of an 'Open Sesame' lock that will only yield to a particular watchword, and of a sympathetic cradle which would commence to rock when the baby murmured, and rock the faster as the baby cried the louder, thus affording a beautiful example of the fitness of things.

The sensitiveness of the telephone is as remarkable as its fidelity to the sound waves. A red hot copper wire drawn across the rasp of a file was found, by Professor G. Forbes, to yield a series of thermoelectric currents which caused the telephone to give out a musical note. Since the time of Galvani, the nervous fibres of an animal have been regarded as the most exquisitely sensitive galvanoscope which we have for detecting electric currents, but the experiments of M. D'Arsonval prove that even an ill-made telephone is at least a hundred times more sensitive than the nerve, to feeble variations of the electric current.

The power of the telephone to transmit the voice to long distances is intimately associated with its delicacy. Mr Willoughby Smith has found by experiment that a telephone will work through a 'resistance' of wire corresponding to a hundred and fifty thousand miles of telegraph line, and hence it would seem more child's play

to fulfil the words of the poet, and 'waft a sigh from India to the Pole.' But this was only a laboratory experiment, for an actual telegraph loses the leakage of electricity from the wire to the ground, damp and other drawbacks, render the transmission of speech by wire far less easy in practice than was at first supposed. Nevertheless, it is on record that Mr Edison transmitted speech over a line seven hundred and fifty miles long in America, and conversation has been carried on over five hundred miles in India, three hundred and ninety miles, from Tabriz in Persia to Tiflis, and three hundred miles in Spain, Australia, and other places where the atmosphere is dry and pure. In England, we have not been able to work through such long circuits, owing to the wetness of the atmosphere, but Mr Van Rysselburgh, the ingenious chief of the Meteorological Observatory at Brussels, has telephoned from that city to Paris, a distance of two hundred and fifteen miles, and thus while the same wire was carrying simultaneously an ordinary Morse telegraphic message. By a peculiar disposition of his apparatus, Mr Van Rysselburgh spoke to Paris by telephone with out any interference from the Morse signals that were traversing the identical wire at the same time.

The day after the bombardment of Alexandria, it was announced in the London papers that the noise of the guns had been heard at Malta by telephone through a thousand miles of submarine cable. Experienced electricians took the statement with a grain of salt, because they knew that a submarine cable differs from a land telegraph wire in the greater retarding effect which it has on electric currents travelling along it. A cable has the effect of running together—jumbling up—the delicate and rapidly succeeding vocal currents of the telephone, and either smothering the articulation or creating absolute silence. Five hundred miles of land line would make little or no difference on the distinctness of a telephonic message, supposing the wire to be well insulated from the earth, but a hundred miles of ordinary submarine cable would probably be quite dumb. Indeed, some experiments made by the writer, with Dr Munk's artificial cable, show that while the voice could be faintly heard through a length equivalent to fifty, or even sixty miles, when it came to eighty miles no sound at all was audible. The inductive retardation had fluttered away and blotted out the delicate undulations of the vocal currents. Telephonic messages have, however, been successfully sent by cable across the Channel, and from Holyhead to Dublin, but in no case has the length of cable reached one hundred miles. The dream of whispering across the Atlantic under the 'roaring forces' is likely to remain a dream for a long while to come.

Although aerial wires are common in this country for telephonic work, in France, Germany, and other continental countries, underground

cables are chiefly employed. These are less subject to external injury, but are more liable to inductive retardation than the latter, though not so much as on a submarine cable. The peculiar crackling noises heard on aerial telephone lines which run close beside the ordinary telegraph wires, are easily cured on underground lines by employing a double wire in the cable, to form the going and returning pathways of the current. Then the currents travelling in neighbouring wires affect each of the two wires alike, but in opposite directions, and so the 'crack' due to 'induction' is neutralised.

Besides the clamour set up in a telephone line by the electricity on neighbouring wires inducing audible currents in the telephone wire, there are disturbing noises caused by currents passing through the earth and entering the telephone circuit. These are sometimes due to electric-lighting conductors, or to ordinary telegraph wires running to the ground near by. In Manchester recently, all the telephone currents were stopped because of the humming sound caused the telephones by the escaping electric light currents. Lightning storms too, and magnetic disturbances, are apt to cause floods of electricity in the body of the earth, which overflow into the telephone lines and interfere with their working. The best remedy is to employ the double wire system mentioned above, and not to use the earth at all as a return pathway, as is ordinarily done in telegraphy. The lightning effect is readily heard by connecting a telephone to the water pipes of a house on the one hand, and to the gas pipes on the other. On listening into the instrument, every flash of lightning will be accompanied by a crackling sound. The 'earth' currents which often flow through the ground although there is no thunder, can be heard in the telephone by connecting it in circuit with a wire and two large metal plates buried in the ground. The result has been likened to a boiling sound. The discharges of the magnificent aurora borealis which was seen in New England on August 4th of last year, were also heard in the telephone by a gentleman at Mont Clair, New Jersey, who likened them to the crackle which lightning gives, interspersed with feeble ringing taps repeated every half second. These fishes, the torpedo, the gymnotus or electric eel, and the electric ray, have also been caused to send their electric discharges through a telephone, and the sound heard has proved the emanation in each case to be an intermittent current. That of the torpedo is very powerful and prolonged, giving a moaning sound, that of the gymnotus is a sudden shock, and that of the ray resembles the discharge of the torpedo, but is very much feebler, owing to the smallness of its electric organ. In fact, a young torpedo the size of the hand will give a far more powerful shock than a full-grown ray.

The violence of lightning-currents has been

accompanied by accidents to the life and limb of persons using telephones during a storm, but such cases are rare. At Hartford, Connecticut, several years ago, a doctor was speaking to his assistant by telephone, when the instrument blew up in his hands at the moment of a terrific thunder-clap. He suffered no injury, but the instrument was ruined, and his assistant was struck deaf for several hours in the ear with which he listened at the receiving telephone. Again, during last summer a flash of lightning struck a telephone line at Strasbourg Cathedral and burnt up the instrument, which a member of the city Fire Brigade was speaking through, but did no other damage. In America, such accidents are now guarded against by the use of lightning protection, but they have not been thought necessary yet in England, though, for all they cost, it would perhaps be prudent to adopt them on our circuits.

Before leaving the subject of telephone lines, we ought to mention their introduction into the *Mauvres* and *Oak Colleries*, to communicate between the galleries, below and the pit mouth. In times of accident, they may prove the only means of communication between the miners below and the *trip* above. Experiments have been also repeatedly made with the telephones attached to the diver's helmet, and at last year's North-east Coast Exhibition, every word spoken or whispered in a diving bell below water was heard above. Besides being taken into the depths of the sea and the bowels of the earth, the telephone has been lifted up into the skies, and balloons have communicated with each other and with the ground by their means. Marston can now communicate with the score and turn the effect of their shot, or ships can speak to the shore, as in the case of the Helicon line which enabled Sir Beauchamp Seymour to talk with the British Embassy at Alexandria. Even in Arctic exploration it has been proposed to lay a telephone wire along the ice, to enable the sledging party bound for the Pole to communicate with the ship which forms its base of operations. Certainly the ice would be a good insulator, and the line would be a guide for any party of assistance. The scheme appears feasible enough, always supposing that the wire failed to excite the curiosity of some Polar bear.

The minor applications of the telephone have been very numerous, but none has been so interesting in its results as the Induction Balance of Professor Hughes. By uniting it to the coils of the balance, that inventor has made the telephones very sensitive to the presence of metals, and it is possible to tell a good coin from a base one, or a worn coin from a new one, by the sound given out by the telephone. Professor Roberts, indeed, has to a certain extent succeeded in a syringing gold and silver coins by its aid, but the degree of hardness of the coin actually affects the result, although the weight and purity may be exact. Two years ago, an arrangement of the balance was proposed by Mr J. Murray, C.E., for prospecting metal veins, and this arrangement is substantially the same as that recently applied by Professor Graham Bell to locate the bullet in the body of the late lamented President Garfield, perhaps the noblest duty which the telephone was ever called upon to fulfil. The extreme delicacy

of the apparatus was demonstrated at the Paris Electrical Exhibition in a very curious way. Mr. Elshah Gray, the well-known inventor of the Harmonic Telegraph, was a little sceptical of the performances of the balance, and desiring to test it, he told Professor Hughes that for thirty years a small spark of iron had lodged in one of his fingers and could still be felt there like a pinhead. Could Professor Hughes tell him which finger it was in? One after another the fingers of the injured hand were put into the balance, and when the 'crime' one was inserted, the telephone proclaimed the fact in unmistakable tones. A similar arrangement of the balance has also been applied by Captain McEvoy to the detection of submarine torpedoes, and sunken chains, anchors, or buoys. In this there is a movable part of the balance which is lowered into the water, and when it comes in contact with the submerged metal case of the torpedo, or any other metal mass, the telephone in the observer's hand immediately indicates the fact. Such are a few of the curious uses of the useful and delicate telephone.

## ONE FALSE, BOTH FAIR, ON, A HARD KNOCK

CHAPTER II.—COUNT DE LALOU'S

'Batten down the hatches, gual, zoon!' Helm hard down! quartermaster, d'ye hear? Steady, steady, there, forward! Station, all of you, and look alive!—Mr MacGru, or, get that sail in before it's blown from the bolt ropes—Mr Dodd, a lee-wheel to the helm, before the sea swamps us—Bear a hand! Steady, so!' As the captain of the *Ogyris* shouted these orders hoarsely through his battered trumpet, his voice was all but drowned by the shrill shriek of the furious wind as it rushed through the strained rigging, and the ship reeled and quivered like a thing in pain. A gale had come on, and worse than a gale, for it was a white squall. Old seamen, to whom the rounding of Cape Horn is a familiar task, and who are used to cyclones and hurricanes, yet speak with a semi-suspicious respect of the terrific white squall of the *Mediterranean*.

There had been no warning. Like a thief in the night, the storm had burst upon the *Ogyris* without threat or signal of its approach, and the first intimation that Nature was in a passion was that the fine steamer was laid abruptly on her beam ends in the tumbling tossing water. She righted, and fought her way ahead in the midst of her elemental war, but it was cruel work. Gone were the peaceful seas and the pure canopy of heaven and the drowsy ripple of the gentle waves. As if by magic, the ocean had changed. The sky wore its ugliest frown. Rain and hail—no light sugar-plum hailstones of summer, but jagged bits of ice, heavy, three-sided lumps that cut and bruised—lashed the deck. The wind howled in menacing cadences through the rigging. The salt spray broke incessantly in drenching showers over the dripping bulkheads.

Now and then there was a gurgling wash of water, as a heavy sea was shipped. The panting engines toiled on, fighting, as with a living foe. It was no easy matter to distinguish between salt sea and driving rain. A fierce fight went on.

The fight was on one side sustained by wolfish waves and howling wind, and on the other, by skill and patient bravery, and the regular steady stroke of the steam piston, like the measured beat of a giant's mighty heart, to force the *Ogyris* on. For hours, as the vessel heeled over perilously before the threatening gale, or as the billows reared their menacing heads, like watery mountains, to deluge the steamer's deck with a rush of foaming brine, it seemed doubtful whether the balance would incline to life or death. Among the passengers below decks was anxiety and alarm. Even the hardy old captain half despaired of saving the ship. Any accident, such as in quiet times goes for nothing, such as the snapping of a rudder chain, the starting of a boiler plate, must have been fatal.

Fortunately was it in such a crisis that the packet was a fine new steamer, well found, and urged by powerful engines, and thus could bear the brunt of the squall until its violence was somewhat spent and the danger all but over. Before the first grey, pinkish streaks broke in the eastern sky, there was an end of the torrents of rain which had deluged the deck. The slanting wind, tuned down its storm scream to a moan, though yet the sea ran high, and the vessel rolled heavily as she battled her way through the surges. The captain had gone below at last, leaving the care of the ship to the officer of the watch.

Slowly and, as it were, reluctantly the cold dawn came. The sea was still boisterous, the complaining wind yet shrill, and a train of rugged clouds, like fugitives from some hidden army, appeared, flying past alone, the pale skyline. It was not a likely moment for a passenger to quit the warmth and comfort of the cabins below, nevertheless a solitary figure bravely glided up the companion stair and viewed the heaving deck—on which it was no very matter for any but a sailor to walk—with some difficulty, but with a false firmness and swiftness of tread like the soft but weighty footfall of a tiger. It was not, as has been said, a morning to invite the casual admirer of Ocean to be early on deck, and such of the crew as, muffled in their monkey jackets of rough Flushing or Guernsey cloth, busied to and fro, looked with wonder at the fugitive lady as she made her way to what, at the vessel's starboard side, a boat, slung, sundrily, offered shelter alike from keen wind and prying eyes. There she stopped, and with one gloved hand on the tough cordage of the nearest shroud, stood erect, in spite of the violent pitching of the steamer, as if waiting for something or for some one.

There are persons to be met with—not often indeed, some four or five times perhaps in a lifetime—who tower, morally or intellectually, above the hordes of the easily forgotten crowd, and whose hold upon the memory is quite disproportionate to their influence over our own private fortunes. Such a one was the lady who

was known to chief cabin passengers on board the Peninsular and Oriental packet (as she was called) as Madame de Lalouve. See her now as she stands—with somewhat of the grand composure of an Egyptian statue, majestic in the solemn calm of unworldly centuries of repose—and looks out over the wildernesses of waters. You might mistake her. Such as she are often the objects of aversion. Very likely you might distrust her. But it would be impossible to consign her to the category of the commonplace. The mention of a French Countess is apt to conjure up visions of a mannerly little woman, elaborately attired, and as artificial in her bloom as in her manners. But Madame de Lalouve was tall and stately, handsome without, not young, certainly, but with one of those clear dark complexions that owe nothing to cosmetics. There were a very few threads showing silver to mark the bloom blackness of her massive hair. She dressed richly, but simply too.

What was the antecedent of Countess Louise? Nobody knew. The two or three continental passengers on board the Peninsular and Oriental packet were as much in the dark on that head as were their insular fellow travellers. Tatish had seen her—he was certain of that—at an Imperial entertainment at the Tuileries. But this proved nothing. The official activities of the French capital used to be splendid, but not exactly secret. It was said also that the Sphinx had something to do with the Egyptian government and with Imperial Misadventure. She had influence—so the tourists somewhat enviously declared—with the 'Palace lot,' with Kourbachi Pasha, and Talib Effendi, and Beck-beech Bey, and could get a state steamer, or procure an official dinner before which Ministers grovelled, and even governors, new sublimates, when ordinary waiters were helpless.

Was Madame de Lalouve even French? Her name sounded Gallic enough, and her accent was faultless, but she might well have been a Pole or a Magyar, or even a Russian, so varied were her reminiscences of former scenes and friends, of Archduchesses and archplotters of Spanish Infantes, Red Revolutionists, Imperial Highnesses, celebrities of the studio and the stage, and the circles of the money market, when she seemed to talk. Sometimes she was provokingly reticent, and not seldom spoke in riddles, as if to justify her Egyptian nickname of the Sphinx. To the Marchioness of Lecomte and her sister Cora, this cosmopolitan Countess did apparently find it worth her while to talk, winning their attention, as it seemed, less by what she said than by the strange winning charm of her expressive manner.

For whom, or for what, was it possible that Countess Louise, at such a time and in such weather, should be waiting, half hidden behind the boat swaying in the ship, and peering the rugged shroud nearest to her for support upon that heaving deck? It was not very long before the question was answered by the appearance of another figure, clearly out of place, as it seemed, in such a place—that of a slender, golden haired girl, dressed in black, who crossed the deck with slow and uncertain steps. She, too, glanced apprehensively around her, as if in

dread of detection, as she approached the boat that half concealed the tall form of the foreign Countess. The new comer was by much the younger, and should have been the more active of the two, but she could scarcely keep her feet, so violent was the motion of the vessel.

'Why have you summoned me at such an hour?' asked the girl breathlessly, as she caught at the ship's side for support.

'Because, Mademoiselle, it was precisely at such a time that our meeting would pass unnoted,' was the cool reply. 'I like the impostor, don't you? Yes, I knew, when I slipped the note into your hand, that you would come. The time I chose was just when the poor cowards below were giving themselves up for dead and drowned, too busy with tears and prayers, too hysterical and confused, to spy upon others.'

'It was an awful night,' said the girl, shuddering.

'Yes, but I have seen worse!' returned Madame de Lalouve, with an impatient shrug of her shapely shoulder. 'In 1804, 1812, 1815, our dear Marchioness—at last asleep!'

'Yes, I am asleep,' answered Miss Crew, in a low tone. 'Pons (her father) was frightened, one among so many who were half dead with alarm—and I was glad to see her at last when I—stuck away, just now.'

'And you, Miss Cora, were you afraid?' asked Madame de Lalouve abruptly.

'No, for a wonder, I was not,' replied the girl. 'Among all these terrified people, the crying children, the scared women, I was surprised to find myself remain so calm and cool—as calm, almost, Madame, as yourself.'

'Don't I have not prejudged you,' muttered the foreign Countess, 'you can dare, and you can do. Have you remembered my advice?'

'Perfectly,' replied Miss Cora, in a very low tone, and growing, even by that dim and uncertain light, perceptibly paler. 'How should I forget?'

'Good, you,' rejoined approvingly Madame de Lalouve, as her gloomy eyes rested for a moment on the fair young face beside her. 'There is one thing, though, of which you have not thought, and here it is. And, as she uttered the words, she drew forth from beneath the folds of her dark shawl a folded paper, thin and square, such as draughts use. 'Take it, and be careful to let no eyes but your own behold it, until the moment comes. Your woman's wit will teach you what to do with it.'

'No, no—I cannot do it!' murmured the girl, with white lips and half-startled head, 'never—never!' And she recoiled a little from the side of her foreign friend.

'Never—never!' repeated Madame de Lalouve, in a voice which, low as it was, rang with an eloquent—then that was but half-suppressed. 'I was mistaken, then, after all! You tell me. You are like the rest, merely the blonde Miss—the English simplicity, all bread and butter, as your own Lord Byron sang, never to shake off nursery.

You bring dare  
not do it!  
These last better words were heeded rather than

spoken, and with an emphasis that had in it something terrible. Still, Miss Carew hesitated, palpably flustered, looking down at the deck until, by a sudden impulse, she lifted her blue eyes and met the darkling gaze of the foreign Countess with a resolution equal to her own.

"I am not afraid," she said, almost in a whisper. "Give it me—the packet, quick!"

The gloved hand of the Frenchwoman met the white soft fingers of the English girl, and touched for an instant, as the thin square of folded paper was rapidly transferred from the keeping of Countess Louise to that of Miss Carew.

"Hide it—some one comes!" exclaimed Madame de Laloupe hastily, and then she turned aside and seemed to be intent in her observation on sea and sky. Another passenger had come on deck, and this time the firm heavy tread was that of a man, tall, young, and sufficiently handsome.

"Madame de Laloupe!" and a deep rich voice in evident surprise. "I scarcely expected to be fortunate enough to meet a lady on deck so early and after such a night."

"You are astonished, Monsieur Talbot? Perhaps we were too terrified to rest. Or we longed for fresh air. Or we wished to see with our own eyes—women are inquisitive, you know, like poor I mine in Blue Bird's cabin—we wished to see that the danger was really past," answered Countess Louise in this half-mocking tone the often perplexed those with whom she conversed.

"Lady Leominster!" said the young English man, with a gesture of raising his hat, while his whole manner changed as he caught sight of the younger lady's form. "I had no idea that you, too, had ventured on deck so early, and with such a heavy sea still running—May I offer you my arm, if you are going below again?" It was evident that Mr. Talbot, if such was his name, believed himself to be addressing the widow Marchioness.

"Courage!" It is of good omen, *chère belle*! muttered Madame de Laloupe, and with some half-audible word of thanks, the girl laid her white hand on the young man's strong arm, and allowed herself to be led away without an attempt to correct the mistake into which he had fallen.

Arthur Talbot felt the soft hand tremble, and he had enough to do to restrain the steps of his fair charge across the rolling deck, but as he drew nearer to the cabin stairs, he turned his head. "I beg your pardon, Countess," he said, with the instinctive courtesy of a gentleman, "I will come back, if I can be useful to you, as soon as Lady Leominster is safe in her cabin."

"It is not the trouble to disturb yourself for me, *mon ami*, Monsieur, I can take care of myself," replied the Frenchwoman, with perfect composure, and then she averted her face and stood in an easy attitude, scanning misty sky and tossing sea. When she turned her head, the deck was clear, save where the helmsman stood, attentive, at the wheel. And then Madame de Laloupe traversed the difficult deck, treading the wet and tremulous planks with even a more assured step than Arthur Talbot's own. As she descended the brass-bound stairs that led to the

cabin below, she struck her gloved palm lightly upon the painted hatch, and with a brightening eye and a low laugh of triumph, murmured. "The game is won!"

## REMINISCENCES OF THE MINOR STAGE

BY AN OLD SEAGUO

PART III.\*

To leave on record my recollections of the 'unpleasant' houses, without mention of the 'stage' sailor and certain of his representatives, would be to omit one of the most interesting features. The 'British tar,' as seen through the spectacles of the British playwright of fifty years ago, was quite unique. Built up on the familiar lines furnished by the songs of Dublin, he became an institution. The patriotic fire fed by our victories at sea during the then recent war with Napoleon, had indeed somewhat abated, but the memory thereof had served to enow the defenders of our wooden walls with all the attitudes of a race of heroes. This popular sentiment was ministered to, and kept alive by, the astute theatrical manager. With the assistance of such practised hands as Jerrold, Buckstone, Haimes, and Marshall, so was a foregoing conclusion. A run of one or two hundred nights was by no means unusual with pieces of this class. Another remarkable peculiarity attaching itself to the nautical drama was the fact that its chief characters were almost invariably taken from below the mast.

'Jack' was without doubt the central subject of the picture, the real, in sporting phrase, was nowhere. Admirals and post-captains, when introduced, were for the most part mere lay figures. The best of the actual sea narratives were produced on the trans-pontine stage, a noble old Surrey Theatre, where such pieces as *Black-eyed Susan* and *My Pell and my Partner* secured supreme

Admitting the popular regard for this particular phase of public amusement, it might be natural to assume that most of our leading actors on the minor stage would endeavour to excel in this favourite rôle, but it was not so, and the reason was not far to seek. When Elliston produced Douglas Jerrold's *Black-eyed Susan* on Whit-Monday 1829, Mr. Thomas Potter Cooke had been selected to play the part of William. The choice was a happy one. Author, actor, and manager were alike delighted. From that time forward until his death in 1864, his superlative talent in this speciality was eagerly recognised, and securely maintained. 'Tippy' Cooke not only extorted admiration, but inspired affection. Native, and in the manner born, no shade of distinct personality escaped him. With a strong sense of humour, he united a natural manliness in voice, bearing, and manner, loose and easy in his movements, he carried about him a show of freedom begotten by his commerce with Father Neptune, liberally exuberant, without being boisterous—excepting under stress of weather—he would spin you a marvellous yarn in good faith, pathetic without being lachrymose, his tears were closely neighboured

\* Continued from Nos. 954 and 973 of this Journal.

by gaiety. His scrupulous attention to costume passed into a proverb. Outside this particular line of business, he had no equal in the delineation of such parts as Frankenstein and Vanderdecken, his pantomimic action was superb. A nimble dancer, his hornpipes were the delight of the town.

Without doubt, the approved superiority of T. P. Cooke deterred many would-be competitors, but there are one or two who deserve mention. I call to mind Campbell of Sadler's Wells, a competent actor of a melodramatic cast, but he was hard and heavy, and lacked vivacity. Farrell and George Rignold, both of the Pavilion, were only passable as impersonators of the 'long shore sailor,' whose merit consisted in swilling three-quarter grog and expectorating tobacco juice.

The rage for the nautical drama had reached its zenith when Miss Mastrilly made her first appearance at the east end of London with equal success. Davidge, an actor of eccentric parts, then manager of the Surrey, determined to secure her services for his own house. The transfer was soon effected, and the lady quickly established herself as a favourite. As Miss R. Honner, she enjoyed the privilege of inspiring her patrons not only with all the usual marks of admiration for her talents on leading streets, but also with respect, esteem, and love for her virtues. Her scenic displays were simply a reflection of her personal character. Gifted with much emotional power when occasion needed, she never made any unnecessary use of this power. Robert Honner, the husband of this lady, was a useful member of the company, but his special talent was discovered in the difficult art of mimicry. When he became leader of Sadler's Wells, he found a field worthy of his abilities. No puns were spared to raise the character of the entertainments, and he became very popular. Eventually the City of London Theatre passed under his sway.

During these enforced absences, his wife's services were withdrawn from the old theatre in the Blackfriars Road, and we were fain to fall back upon the attractions of another local star in the person of Mrs. Henry Vining. To this meritorious actress we offered our suffrages freely, and she justified the gift by her faithfulness. Rather under the middle size, and with the complexion of a brunette, she had one of the sweetest voices that ever charmed an audience. Thoroughly at home as the heroine of domestic drama, she enlisted our sympathies by the potency of her appeals. Without undue vehemence, she had vigorous declamation at command, as witness her *Jane of the Hatfield*, and her *Mrs. Blyden*.

In the person of E. F. Seville we had a prodigious favourite. Coming of a theatrical family, the traditions of the stage were familiar to him, and, be it said, he made good use of them. Although but a young man, he had mannerisms of the most pronounced character, but without there was an enticing charm about his acting which served in some sort to condone them. In clear ringing tones his enunciation was always distinct. With force enough in reserve, he never bore passion to tatters, but used his power discreetly. He wooed admirably. Without the qualifications necessary for a leading man, he made a good juvenile tragedian. I call to mind,

an excellent performance of Iphigenia to the Virgins of Mr. Obaldistion. If time should wait upon merit, the last-named gentleman's career at the Victoria, both as actor and manager, deserves a record. Previous to his advent, dirt and incompetence prevailed on both sides of the curtain. He cleaned and renovated the entire establishment, introduced an excellent working company, and wisely employed their various talents in illustrating the best literature he could command. *Woman's Love*, and *Susan Hopley*—a dramatized version of Mrs. Crow's novel—were huge successes. As an artist, Obaldistion revealed his best points in serious comedy. Don Felix, Mr. Oakley, and Marquis, were admirable specimens of sterling merit. His *Bob Roy*, too, was exceptionally good. Boasting such efficient coadjutors as Seville—transferred from the Surrey—John Dale, Seaman, and Henry Howard—a competent actor, with a fine presence and a noble voice—Obaldistion could mount a five-act play with rare effect. Paul and John Gardner, supplied the comic element. Gardner was a genuine comedian, with brain power enough to grasp the idiosyncrasies of Shakespeare's clowns, and adequately represent them. Touchstone, Launcelet Gobbo, and Grumio, were impregnated with subtle humour.

Miss Vincent was without doubt our great attraction. Beautiful, impulsive, natural, she portrayed to perfection the ideal domesticities of a humble life as pictured in the dramas of the day. 'The heroine of domestic drama' was not permitted to carry the remnants of a broken heart under a mantle of reserve, neither were her joys to be hidden by a fictitious appearance of repose. The impulses of our common humanity were laid bare as with a scalpel. This mode of treatment not unfrequently imparted a degree of coarseness to the conception of character, which would not be tolerated now, even under the plea of realism, but fifty years ago we were not so squeamish, rudeness was often condoned by fidelity.

With the reader's kind permission, I will now add a few particulars not generally known in connection with a transition period. Half a century since, the environs of London were plentifully studded with pleasant places of public resort called tea gardens. Some of these were of considerable size, sufficiently large indeed to admit of a bowling green or a roiled space for tennis. Time, however, arrested by the speculative builder, made short work of most of these. Still a few spots remained, albeit terribly shorn of their original proportions. In some sort to make up for lost attractiveness, a few of the wealthier proprietors erected stages in some part of the ground still remaining to them, singing and dancing, with the performance of operettas and dramas, were speedily introduced with success. Consequent on the introduction of these new elements, the primitive recreation ground, with its rustic arbours and trim flower beds, gradually assumed another phase. The simple characteristics of the old tea garden having been superseded, a change of name was suggested by the various houses, as indicative of a more comprehensive entertainment, henceforth, they were styled 'saloons,' as witness, amongst others, the Grecian, the Albert, and the Bower.

In connection with the last-named establish-

ment, I am in a position to offer some interesting particulars. Forty years ago, the proprietor of the tavern, saloon, and gardens was a Mr G. A. Hodson. In person, this talented gentleman bore a most remarkable resemblance to Charles Kemble. His claims as a composer were well known in the popular songs of *Tell me, Mary, how to use thee*, and *My Bonny Black Doe*. Though an indifferent actor, he was a good baritone singer and a thorough musician. With his numerous family—each of whom possessed some ability—and a small selected company, he contrived to furnish a creditable diversion. G. A. Hodson, Junior, found his way to the boards of Covent Garden Theatre, when under the management of Madame Vestris, where he made a successful debut as her Lucius O'Trigger. One of the best comic singers of the day, W. H. Sharpe, was a great favourite here. Our leading man for a considerable period was Henry Dindley, a praiseworthy actor, who afterwards became noted at the east end of London and the Victoria. But perhaps my most precious association with the Bower remains in the fact that I assisted at the first public appearance of 'Little Robson'. I was an amateur then, and a near neighbour, and we fell into easy companionship. He had already donned the sock and buskin at the private theatre in Catherine Street, to the great delight of his friends. But I wished to elicit the unbiased opinion of an audience to whom he was a stranger. With this end in view, he made an application to Mr Hodson for permission to play the Aftful Dodger in the dramatized version of *Oliver Twist*. The manager cheerfully assented, and put the piece into immediate rehearsal. During the initial performance, Robson evinced so much talent that the lessee prognosticated a complete success. The result varied the prediction. Slightly nervous on stepping to the front, he soon warmed to his work, and gave such a taste of his quality as led to the offer of a regular engagement. This was fitting, in itself. But he wisely refused to entertain it. Keenly alive to his deficiencies in all that pertained to the 'business' of the stage, he determined to go into the country forthwith, in order that he might gain by experience the necessary technicalities of his adopted profession. This task accomplished, he returned to London, and eventually became the famous actor we are proud to remember.

## FOR HIMSELF ALONE

### A TALE OF REVVERED IDENTITIES

#### CHAPTER II

For a little while no one spoke. The minds of the three men were occupied with the same subject, but each of them was looking at it from his own point of view.

'You were my father's friend, and you must be mine in this matter, Mr Gimp, and Frank at last. It shall be nothing out of your pocket to humour me in this whim.'

'But it will be so unprofessional—so utterly unprofessional,' urged the little lawyer, with a look of comical distress.

'I do not ask you for any active assistance in the matter, all I want is your passive concurrence,' urged Frank.

'I have no posture of any kind, Mr Frobenius.'

'Not more than I do, as a rule. But this one cannot harm anybody.'

'One never can see how things will end. Mr Drummond's looks and general appearance are so different from yours.'

'That does not matter in the least. Neither my uncle nor aunt has seen me since I was twelve months old. My cousin Clivia, and my other cousin Elma Deena, have never seen me at all. I am not a bit like my mother, I have been told. Features, eyes, hair, are all my father's.'

'I do wish to see you, Mr Frobenius, that if you must carry out this scheme, you could do so without in any way implicating me in it.'

'I must really claim your passive assistance, my dear sir. Without that, my little plot would at once break down.'

Mr Gimp lay back in his chair with a sigh of resignation and began to polish his double eye glass. Mr Frobenius was evidently a most determined young man, and some concession was due to the whims of a client with eight thousand a year.

'And now for my instructions,' cried Dick. 'They are of the simplest possible kind. The moment my uncle is announced, you become Frank Frobenius, and I become Dick Drummond.'

'In other words, I become you, and you become me—for the time.'

'Yes, till I give you leave to resume your own identity.'

'So hear, my lord, to obey. Frank turned to the lawyer. 'Have you a confidential clerk, Mr Gimp, whom you can place at my disposal for a week or two?'

'Certainly, Mr Frobenius. Our Mr Whiffles, though young, is discretion itself, and by no means devoid of intelligence. I shall be happy to place him at your disposal.'

'Be good enough to send Mr Whiffles to me at ten o'clock to-morrow, and advance him fifty pounds before he comes.'

'By pardon, but any instructions that I can give Whiffles from you—'

'Thanks, but I prefer to instruct him myself. The business on which I am about to employ him is strictly confidential—at present.'

'Just so. No doubt Whiffles is your man, sir.'

For the second time a knock, and next moment the sound of all work somewhat clouded face was visible. 'Another gentleman to see Mr Frobenius,' was all the said.

'My uncle!' exclaimed Frank. 'Oh, my prophetic soul!' cried Dick.

Mr Gimp fumbled nervously with his eyeglass, but did not speak. The three men glanced at each other with a sort of guilty consciousness.

'Show the gentleman up,' said Frank to the servant. 'Now, Dick, attention—Now, Mr Gimp, if you please.' His face had darkened again as it had darkened when his uncle's name was first mentioned. In his eye there was an expression such as Dick had rarely seen in them before. He went back to the sofa between the two windows and resumed his seat.

Footsteps were heard on the stairs. Mr Gimp

crowed to the door and opened it. 'Mr Peabworth and Miss Deane,' he announced in his blindest tones, but despite himself there was a tremor in his voice.

Mr Peabworth was the first to enter. He was a stout built, big boned man of fifty, with iron gray hair and closely cropped whiskers, he had a broad expanse of face, with cheeks that were already becoming pendulous from over feeding. The normal expression of his small, keen, steel gray eyes was one of suspicious inquiry—they were eyes that seemed to be for ever interrogating you—but he could, when it so pleased him, charge them with a sort of cold twinkle, which the world in general accepted as an outward and visible sign of an inborn geniality of disposition, such as those who know him best—say his wife or daughter—would have been the last to give him credit for. He had a mellow and unctuous voice, and a slow round way of rolling out his periods that lent themselves readily to the same deception. In point of dress he was studiously plain and precise. He wore a black tail coat and vest, pepper and salt trousers, and shoes that were tied with broad black ribbon. He might have worn the same carefully tied checked neckcloth and the same high stand up collar from January till December, seeing that they never varied in the slightest particular. His silky broad brimmed hat was worn well back on his head, as if he courted the world to look in the face of an honest man. Finally, he was seldom even without a bundle of papers tied with red tape, either under his arm or bulging from one of his pockets.

This personage came forward slowly and with a degree of hesitation very unusual with him. His small gray eyes quickly tick in the room and its occupants, resting finally and for the second time on Frank, who from his seat on the sofa was regarding him with no very favourable eyes.

'Where is my dearest Frank?' demanded Mr Peabworth. 'Where is my scape, race boy, whom I have never ceased to cherish in my heart as though he were a son of my own?' Without waiting for an answer, he crossed the room with a sort of elephantine lightness, and made his way direct to Frank's side. 'Ah here the rascal is!—But not ill, I hope. God bless my heart, not ill!'

Dick had started to his feet by this time. 'Why, uncle, don't you know me?' he cried. 'Don't you recognise your long lost nephew? I'll never believe in family likenesses again!'

Mr Peabworth turned with a quickness that one would hardly have given him credit for. If disconcerted at all, it was but for a moment. 'What! Oh, ah, to be sure!' he exclaimed. 'Very stupid of me. Rather short sighted at any time of life. That must be my excuse.' His back was turned to Frank by this time, and next moment he was shaking Dick warmly by the hand. 'My dearest Frank, I am delighted to find you! Now that I see you close, I should recognise you anywhere! Your likeness to my late lamented sister, your poor dear mother, is truly wonderful!'

'Glad to see you, uncle. A long time since we last met,' responded Dick in a hearty off hand way.

'A long time indeed. But I have never ceased

to think about you, nor to wish for the day to come when I should see you again. That happy day is here at last—but how is my niece Fima waiting to greet you—Fima, my pet, your cousin Frank, the cousin whom we have so often talked about and longed to see.

The young lady thus addressed was a slender dark eyed girl of some twenty summers, with clear cut aquiline features, an olive complexion, a profusion of soft silky black hair, and a lovely dimple within an inch of her lips when she smiled. She was plainly dressed in a costume of some dark soft material, which she wore with a grace and distinction peculiarly her own. She had shaken hands with Mr Gimp on entering the room, and they were now talking in an undertone together. Being thus appealed to by Mr Peabworth, she came forward with the quiet self possessed air that seemed a part of herself. 'How do you do, Cousin Frank!' she asked, proffering her hand as she spoke.

'Pretty well thank you, Cousin Fima, an sword Dick, and he thought that he had never seen a prettier hand.'

'We have had a fine day, haven't we, Cousin Frank?'

'A very fine day indeed, Cousin Fima.'

'Now that we have discussed the weather, we may be considered as knowing each other intimately. And now say something amusing to me. A laugh would do me good.' There was a sort of demure twinkle in her eyes, and she glanced at Mr Peabworth as she spoke. That gentleman and Mr Gimp were talking together.

Dick took his head and coloured a little. 'You will find me but a dull dog, Cousin Fima. I don't believe there is one particle of amusement to be extracted from me. But I must introduce both you and my uncle—here Mr Peabworth turned and became all attention—to my friend Mr Dick Drummond, at present on the sick list, but at all times the best of good fellows and the dearest of chums—Dick, my uncle, Mr Peabworth—my cousin, Miss Deane.'

Frank had risen, and was standing with one hand resting on an elbow of the sofa. His face was very pale, and there was a dul recentful light in his eyes as he turned to Mr Peabworth and bowed coldly to him. But the angry gleam died out, and his lips parted with a faint smile, as he bent his head to Mrs Deane.

Mr Peabworth turned his back on him without ceremony. 'A friend who must be got rid of,' he muttered to himself. Then addressing himself to Dick, he said, 'I wish my darling Chums were here to enjoy this happy meeting, but unfortunately she is away at Cheltenham for a few days. A clinging tumorous pet, my dear Frank, but brimful of poetry, and blessed with a most affectionate disposition—Oh, Gimp?'

'Oh, most affectionate! The little lawyer was evidently on thorns, and was rubbing himself anywhere rather than when he was.'

'Looks upon Gimp as a second father. She has, in fact, such a superabundance of affection, that one father doesn't seem enough for her—Your aunt, however, will be here in the course of a few minutes. She met a friend in the next street as we were coming along, and of course must stop to talk to her. A most estimable creature, my dear Frank, but homely, very homely.'

'My aunt is a gem,' exclaimed Miss Deane 'If you don't like her, Cousin Frank, I shall never learn to like you.'

'If that be the case,' responded Dick, 'my aunt and I will soon be on the best of terms.'

Miss Deane crossed the room to where Frank was sitting. She saw how pale and ill he was looking, and she had not failed to notice how her uncle had turned his back on him. She had brought a tiny basket in with her. 'I have some strawberries here, Mr. Drummond,' she said. 'They are fresh from Covent Garden. Would you not like a few?'

'Thank you, Miss Deane, I should indeed like one or two.'

Miss Deane opened her basket, and displayed a tempting array of luscious fruit and cool green leaves. The tea tray was still on the little round table, and on it was a plate that had not been used. With dainty fingers, Miss Deane picked out some of the finest of the fruit, arranged them on the plate, and then handed the plate to Frank.

'Have you been a long time ill, Mr. Drummond?' she asked in a tone that thrilled Frank from head to foot.

'Nearly a month. But I am greatly better, and hope to get out of doors for the first time to-morrow.'

'So tedious, is it not, to be shut up indoors for more than a day at a time? I recollect once, when I had been very ill and was getting better, how I longed to get out of doors, and how the more they refused to let me, the more I wanted to go. Well, I was not to be balked, so I bribed Jim the gardener's boy to put a ladder under my window after dark. Then, about ten o'clock, after I had been left for the night, I dressed myself, got through the window, down the ladder—it was light moonlight—and ran by way of the shrubbery to the five-acre field. There I caught Dapple my pony, hid a bare-backed scamp round the meadow for half an hour—got back unseen by way of the ladder, and next day was nearly well.'

Frank laughed. 'A sort of escape, Miss Deane, that I am afraid would not answer in every case.'

Mr. Peabworth was propping away on the opposite side of the room to Dick and Mr. Gump.

'Yes, my dear Frank, yours is one of the most extraordinary instances of good fortune that ever came under my notice. I could not sleep for nearly a week after I first heard of it. I presume that you will take up your residence at Waylands! A most charming spot, I have every reason to believe.'

'Why—ah—you see it's too soon yet for me to make up my mind about anything. At present I can hardly believe that my good fortune is anything more substantial than a dream.'

'When Mr. Gump puts into your hand a blank cheque-book and tells you for what sum you can draw upon your bankers, you will begin to believe in it as a golden reality.'

'I think,' said Dick, 'I should like to run round the corner to my friend the pawnbroker's—for the last time, you know—and raise a couple of shillings on a coat or a waistcoat, or something, till to-morrow.'

Mr. Peabworth held up his hands in horror. Mr. Gump looked as if he could not believe the evidence of his ears.

'My dear Frank! I entreat that you will look upon my purse as your own.'

'And mine too, Mr. Frohman.'

'You misunderstand me, both of you,' answered Dick, while a broad smile overpread his freckled face. 'My last visit to my Lombardian relative was to have been sentimental rather than necessary—a sort of regretful leave-taking of one who had not been unkind to me when my fortunes were very much down at heel. But it matters not. To-morrow, I will look up certain shillings leaves which bear the impress of his establishment. They are somewhat numerous, but you, Mr. Gump, will have no objection to solemn for me the various articles specified in them!'

The little lawyer's eyebrows fell from his nose. 'I—John Gump—in a pawnshop!'

Incorrigible Dick only lay back in his chair and laughed.

Meanwhile, our two young people at the other end of the room went on chatting to themselves.

'And now I suppose I am in Bohemia!' said Miss Deane.

'And now you are in Bohemia,' said Frank.

'How do the demands of this strange country live!'

'They exist, they don't live, in the ordinary sense of the word. They paint pictures that seldom find buyers. They write plays that no manager will look at. There are great actors and great musicians among them, only the public is too prejudiced to recognise their genius. They are always more or less hard up—generally more. They smoke a great deal. They also drink—whisky, when they can get it—fourpenny ale, when they can't. They are never down hearted, though they don't always know where to-morrow's dinner is to come from. They help one another, as good fellows ought to do. When Jack is lucky enough to pick up a ten pound note, Tom and Harry come in for a share of it, and when Harry's picture finds a customer, he sends his friends art not forgotten.'

'And I am a man, I should like to be a Bohemian,' said Miss Deane with a sparkle in her dark eyes.

'How much nearer to earn five hundred a year in the City, and not be a Bohemian!'

By this time, Dick was beginning to feel a little bored. He cast one or two longing glances at his microbeum, but Mr. Peabworth held him as the Ancient Mariner held the Wedding Guest.

'You will probably, my dear Frank,' he said, be desirous of investing some portion of your surplus income in one or other of those gigantic commercial enterprises which form such a prominent feature of the wonderful era in which we live.'

'That sounds exactly like a bit out of one of his own prospectuses,' murmured Mr. Gump to himself.

'Of one such enterprise,' continued Mr. Peabworth, 'I have the honour to be chairman. I allude to The Patent Bottled Ozone Company, Chief Office, 43 The Adelphi Court, City.'

'The Patent what Company, uncle?' asked Dick.

'The Patent Bottled Ozone Company, Ham! The association in question may be briefly described as one of those happy combinations of

philanthropy with hard cash which are, alas! too seldom met with in this sublunary sphere. We do good to our fellow-creatures, and fill our own pockets at the same time."

"A truly pleasant combination. But what may be the specific objects of the Company?"

"They are readily explained. By means of recent discoveries in chemical science, we are enabled to eliminate pure ozone from the other component parts of the atmosphere, and to bottle it up for transmission to any part of the world. To invalids, to children, to people of moderate means who cannot afford a visit to the seaside, our bottled ozone will prove an inestimable boon. By its means, you may enjoy all the advantages derivable from a visit to Brighton or Scarborough, without crossing your own threshold. Hm!"

"The prospectus again," whispered the lawyer to himself.

Before Dick had time to say a word, the door was opened, and the sound of all voices was heard, saying, "This is Mr Proboscis's room, mum."

My aunt!" exclaimed Dick as he started to his feet.

"As I said before, an excellent creature, but deficient in culture," whispered Pedworth in a stage "aside."

Scarcely had the words left his lips, when Mrs Pedworth entered. She was homely looking certainly, and plainly dressed, but she had a pleasant good tempered face, and personification of affection of any kind was evidently altogether foreign to her.

Mr Pedworth advanced a step. "Leonora, my love," he exclaimed in his most mucous tones, "behold your long lost nephew!" His arm took a sweep through the air and his finger pointed duceily at Dick.

Mrs Pedworth stopped short in utter surprise. "What! that young man with the red hair my nephew Frank! Wonders will never cease."

## A SCIENTIFIC SOUP KITCHEN

PUBLIC attention has again been directed to the researches of Professor Pasteur in animal inoculation with the germs of various diseases. It will be remembered that this distinguished continental scientist delivered a remarkable interesting address in the August of 1881 before the International Medical Congress, giving an outline the methods and results of his extensive and laborious experiments in this particular field. The details then given are well worthy of attention, even from a popular point of view, as showing the exactness and precision which nowadays characterize scientific investigation, they are also in a wider sense highly important, on account of the light which they shed upon some of the obscure diseases affecting our domestic animals. The ultimate result of their inquiries may yet be of the highest value in relation to the nature of all transmissible

time in regard to the nature of disease germs. These two developments are described in considerable fullness in the above-mentioned address. Their chief distinguishing characteristic concerns in the application of the principle of vaccination, in connection with recently discovered microscopic germs, to the two diseases of chicken cholera and splenic fever the first being a malady incidental to domestic poultry; and the second, under various names, attacking horses, cattle, and sheep.

The experiments in regard to chicken cholera form a very interesting series. When the development of them is directed of a few technical expressions, the principles upon which they are conducted—as is frequently the case in the deepest research—are singularly plain. In the blood of animals which have succumbed to chicken cholera, there resides, according to Professor Pasteur, a collection of germs capable, under certain conditions, of almost infinite transmission. The power of reproduction possessed by these singularly minute bodies is so great, that it has been found in practice exceedingly difficult—under certain conditions, impossible—to procure the poison of the disease in a form sufficiently modified to be safely used for the purpose of inoculations. In other words, and always keeping in mind the principle of vaccination for smallpox, the smallest procurable quantity of chicken cholera "matter," however much diluted, or otherwise apparently reduced in strength, acts on a healthy animal subject, when applied, so strongly as to develop the original malady in all its violence. It is evident that with this effect, inoculation would be worse than useless, as bringing on the unmodified disease which the process was intended to avert.

The method by which this scientific riddle was encountered and solved is as follows: Preparatory to what Professor Pasteur terms "virus culture," a fowl which has recently died of chicken cholera is made use of. The germ precautions are employed throughout the experiments to prevent the entrance of atmospheric germs, which might affect the results. From the body of the dead fowl a single drop of blood, as small as we please, is taken on the point of a slender glass rod, and dipped into a vessel containing a previously prepared decoction of fowl (bouillon de poulet) or clear chicken soup. This decoction has also been beforehand rendered barren of all life by subjection to a temperature of two hundred and thirty-nine degrees Fahrenheit. This culture-vessel, with its contents thus impregnated with the single drop of contaminated blood, is then placed in a temperature of seventy-five to about ninety degrees, when, after a short interval, it becomes cloudy and dull in appearance. In reality it is swarming with tiny microbes, the most minute under the ordinary microscope, but under the most powerful instruments, resolvable into a collection of eight-shaped figures. From this first culture vessel a single drop of the contents is again abstracted on the glass rod point, and introduced to a second vessel of fowl-decoction similar to the former one. From the second vessel, a single drop is in the same way carried to a third vessel, from a third to a fourth, and so on. This process repeated any number of

The investigations into the nature of ferments, &c., carried on in the laboratory of Professor Pasteur have extended over more than a quarter of a century, and the two more recent developments of what is technically called microbes, go far to confirm what is known up to the present

James, produced the same result in every culture vessel employed—namely, a clouded appearance in the previously clear fluid, and the same signs under the microscope. After the vessels have been exposed for two or three days to a temperature of about eighty-five degrees, a sediment forms at the bottom of each and the liquid becomes clear. As, however, all impure atmospheric germs are excluded, the liquid and the deposit will remain unchanged even for months.

Let us now compare the relative strength of our several vaccines, as we may call them, and, strange to say, although we would have thought that one of the more advanced stages—say the hundredth culture in direct order—would have been incomparably less fit to be in germ formation than the earlier ones, the fact is quite different. As proved by experiments in inoculation, the hundredth, even the thousandth culture is as deadly in its effects as the first one, introduced directly from the poisonous blood. And even the blood itself used to inoculate a healthy fowl is not stronger or more certain in effect than any one of the succeeding cultures, all are equally virulent.

Would it not appear, in an ordinary experiment, as if the virus of this disease were thus capable of an infinite extension without being attenuated? Perhaps so, but not to Professor Pasteur. This most careful of manipulators discovered at last a means of modifying it. An interval of time was found to be efficacious in this purpose. The process we have described was continuously carried out, no matter of any appreciable extent—only this necessary for the required transformation—clipping between the successive cultures. This proved to be the secret of the uniform strength of the preparations. But on the other hand, supposing one hundred cultures carried out successively, and the hundred and first delayed till the expiry of a week, a fortnight, a month, or longer, then the difference was at once observable in the results obtained. The first hundred cultures continuously carried out were uniform; the hundred and first was much less potent. Further than this, it became correspondingly weaker or stronger as the interval which separated it from the preceding culture was longer or shorter. It thus became practicable, by varying the intervals, to prepare cultures of different degrees of strength, until a limit was reached when the virulence became null. In this way, by using cultures for inoculation of varying degrees of strength, a certain graduated percentage of mortality amongst fowls was produced. One culture sufficed to kill eight fowls out of ten, another, five out of ten, another, one out of ten, another, none at all. It was remarkable, also, that these varying degrees of culture strength served as starting points from which successive series could be produced—without allowing an interval—all of the same degree of potency as the initial one.

It was found, before the actual principle of vaccination was reached in these experiments, first, that one of the modified cultures produced, on inoculation, a purely local disorder in the fowl operated upon—a temporary morbid modification, which after a time passed away, second, that the solution the virulence of which was null produced no evil effects, its own inherent repro-

ductive power, though present, being prevented to be overcome by the natural life resistance of the subject operated upon. But—and here we come to the principle of vaccination—when a fowl had been made sufficiently ill by a preparation of a strength which it yet had power to absorb, the most virulent culture had there after no evil effect upon it whatever, or only effects of a passing character. It was proof for a year or more against the strongest contagion of an infected poultry yard. This way in inoculation for chicken cholera could be success fully performed.

The reason why if the scientific attention of the chicken cholera disease game is finally explained by Prof. Pasteur. 'My we not,' he remarks, 'be like in principle of a general law applicable to all kinds of virus? What benefits may not be the result?' The factor which intervenes to attenuate the microbe is, he concludes, the oxygen of the air. It is thus which diminishes in time the virulence of the culture, and renders it fit at last for the purpose of safe inoculation.

If it is thus, then be cautious in the tube instead of in the ordinary vessel, and the end of this tube be slowly added, the microbe will in the course of its development gradually absorb all the oxygen in the tube and in the fluid. After that, it will be destitute of oxygen. From that point, as tested by experiment, it does not seem as if any lapse of time has any effect in diminishing its virulence. The oxygen of the air, then, Professor Pasteur remarks, 'would seem to be a possible modifying agent of the virulence of the microbe in chicken cholera, that is to say, it may modify more or less the faculty of its development in the body of animals.'

So far we believe Professor Pasteur's researches and experiments to have resulted in an unquestioned success. There can be little doubt that as regards chicken cholera, the most valuable and important facts are now known. When we turn, however, to his researches into the corresponding 'vaccine' of splenic fever (French *beriberi*), although we find the same industrious and unswerving experiments, the results—in other kinds, at all events—are, or have been lately, somewhat severely questioned. Into the details of the discovery we do not enter fully. The experiments were attended with great difficulty. Suffice it to say that the germs of splenic fever, called 'anthraxoid microbes,' were found to be of a different character from those of chicken cholera, more especially in the mode of their reproduction. Of the two, the splenic fever microbes proved the much more enduring, having been discovered in jugs where animals had been interred for twelve years. Contact with oxygen for any length of time failed, in the culture experiments, to attenuate it in the slightest degree. The requisite weakening of the anthraxoid microbe was, however, effected by selecting it at an early reproductive stage, and subjecting it, in decoction of fowl, to a temperature of between one hundred and seven

\* This disease is known in Russia by the name of the Siberian pest, in Germany, as the Milderand, perhaps in this country it is better known as 'Anthrax.' The germ is scientifically the *Bacillus anthracis*.

and one hundred and nine degrees Fahrenheit. At one hundred and thirteen degrees the microbe is no longer cultivable. Between one hundred and seven and one hundred and nine degrees it appears entirely free of germs, ultimately dying, however, in a month or six weeks. Previous to its death, it presents a series of attenuated virulences. If this opportunity be taken, the same graduated cultures can be obtained as in the case of chicken cholera, and these gradations can be reproduced. Finally, they act as a 'vaccine' for the 'septica' or microbes of full virulence.

One of the most striking statements of Professor Pasteur is that in which he avers, though he does not supply the details of his experiment, that he can restore to those reduced or attenuated germs their original full strength in experiment as he justly remarks, calculated to shed much light on the varying intensity, the rise and fall, of great epidemics, as well as upon their (supposed) spontaneous appearance.

The splenic fever 'vaccine' was at once demonstrated. Professor Pasteur was asked to make public experiments with it. It is estimated that in France alone annually lost from this disease fifty sheep placed at Professor Pasteur's disposal were experimentally upon at Pouilly-le-Fort, near Melun. Half were vaccinated, the remainder undergoing no treatment. A fortnight thereafter, the whole of the sheep were inoculated with the most virulent microbe known. The twenty-five vaccinated sheep showed no effect, while the unvaccinated died within fifty hours. Thus, we are assured by Professor Pasteur, was only one successful experiment out of many, as he had up to the date of his address vaccinated more than twenty thousand sheep in the department surrounding Paris and a large number of cattle and horses. A commission of doctors, surgeons, and veterinary surgeons of Charente-Inférieure, he assures us, his results upon vaccinated and unvaccinated sheep, when the blood of an animal which had died of splenic fever was employed direct. In spite, however, of this testimony, several French medical journals insist that numbers of animals constantly die under Professor Pasteur's hands from the effects of the 'vaccine' issue.

The most direct contradiction of Professor Pasteur's theory, however, is contained in a communication recently made by Dr Khan, in this country, to the Veterinary Department of the Privy Council. Dr Khan seems to have met every care in procuring reliable 'vaccine' through Professor Pasteur's agent in Paris, and so far as his experiments go, they certainly do not tell in favour of the theory. The preparations *Pasteur's vaccine charbonum* and *Pasteur's vaccine charbonum* were calculated successfully, with a certain interval. The results demonstrated that neither of these preparations afforded immunity against fatal anthrax, and also that either of them might of themselves produce the disease in a fatal form. Dr Khan accordingly considers that as this country is as yet comparatively free from anthrax, the introduction of this 'vaccine' is calculated to do much mischief.

It seems under these circumstances much to be desired that a fairer opportunity of testing

the value of Professor Pasteur's treatment for anthrax should be offered. Only in this way can the question be settled. It is impossible, of course, to judge when the evidence is so strangely conflicting. In the interests of science and in those of our flocks of stock, we hope the question may be authoritatively settled, as it is one in every way of the greatest importance.

## STUDIES IN ANIMAL LIFE

While it must be conceded that animals possess most of man's good qualities, it cannot be denied that they share in many of his faults. Animals cherish ideas of revenge with almost human tenacity, and appear to believe thoroughly in the proverb that declares it to be sweet. Some instances of the chastisement inflicted by brute on fellow brute may, however, be considered somewhat more typical of justice than of revenge. One, over to the front in all things, is a story, to animal intellect, of all red many curious instances of injuries remembered and punishment inflicted. Melvain, in that singular miscellany of his, *The Angler in Wales*, gives a remarkable anecdote illustrative of our theme. Two wipers, inseparable friends, named Vixen and Viper, were employed by their owner to hunt in either Oswestry, to the nature of the ground, selected carefully by the owner, only one of the two, Vixen, was enabled to attack the enemy, and the two so carefully studied in the encounter that death speedily followed. Viper appeared in no thick of the life of his friend. The next morning he was missing, and after some hours search, was given up as lost. On returning their steps to the scene of the fatal hunt, Captain Melvain and his companion were surprised to find traces of fresh blood, and on following them up, discovered rolled up together, stiff and cold, in the embrace of death, the other and Viper. From the appearance of the ground and the loss suddenly sustained, it was seen that the battle had been a deep one. Well does Captain Melvain remark: 'It was a most noble incident, a proof of sagacity, an instance of memory, thought, and reason combined, which led this little terror to bite that dog which had been fatal to its comrade in order to avenge her death.'

The length of time a dog will treasure up the remembrance of an injury is truly marvellous. 'He forgets neither friend nor foe,' says Sir Walter Scott, 'remembering with accuracy, both benevolent and injury.' In his delightful *Anecdotes of Dogs*, James Furness gives some noteworthy instances of the strength of canine memory. On one occasion, according to his story, a traveller, in passing on horseback through a small Cornish village, out of pure thoughtlessness, struck with his whip at a large Newfoundland dog that appeared by the roadside. The enraged animal rushed at him and pursued him for a considerable distance. Twelve months later, his business took him to the same village, and as he was leading his horse, the dog, recognizing him, seized his leg, the teeth penetrating through the boot, and the animal might otherwise have done him serious injury, had not assistance been procured. In another case, recorded, some few years ago, in

the *Dublin University Magazine*, in which the persons are mentioned by name, a powerful dog, called Tiger, long cherished a grudge against a friend of his owner for having set a stout bulldog at him. Tiger had fought well, but had to succumb to the superior strength of his opponent. He determined to revenge himself upon the victor of the fight, for a long time he could not find an opportunity, although he daily took up his post outside the offenders' abode, and let him know pretty plainly what his intentions were. One morning his master heard a scuffle on the stairs, followed by a scream. He ran to the door and opened it, when he bounded Tiger, and took refuge under the sofa, whence he usually retreated when he had committed any offence. He was followed by his master's friend, pulled and bleeding, and with his clothing torn. The dog had seized him suddenly, and wrung his wrong. Tiger was dragged out of his place of refuge, and received from his owner a severe chastisement, which he bore, however, with stoical patience. But henceforth he appeared to deem his honour satisfied, and in future made every effort to conciliate the man against whom he had so long entertained spite.

There have been occasions when this long cherished desire for revenge has been gratified in a far more serious manner. The Rev John Selby Wilson, in his highly suggestive work on the *Reasoning Power in Animals*, alludes to the following instance, which occurred, as he pointed out at St Cloud, in the neighbourhood of Paris. A large Newfoundland dog was kept tied up during the hot weather, and every morning a servant maid, as she passed, thinking to do it a kindness, threw a quantity of water over the animal. The dog appeared to consider this daily damage as an insult, but being tied up, it was unable to manifest its resentment. One day, however, the brute was released, and no sooner did the unfortunate servant present herself, than it sprang at her with intense ferocity, and before she could be rescued, killed her.

It has already been seen that dogs will try to avenge themselves upon human beings as well as upon animals, whilst the instances on record where they have inflicted punishment upon other dogs are very numerous. In his *Encyclopædie of Sport*, Blaine furnishes the following anecdote: 'I had in my kitchen, says a certain Duke, two turnspits, one of which went regularly every other day into the wheel. One of them, however, not liking his employment, hid himself on the day on which he should have worked, so that his companion was ordered to enter the wheel in his stead. But the dog hung back, crying and wagging his tail, and making signs to those present to follow him. Being curious to see what he would do, they put themselves under his guidance, when he led them straight to a garret where the idle dog was hid, and immediately fell upon him and killed him on the spot.' It is true, it can scarcely be considered that the dog was prudent in the revenge he took—although, for the matter of that, human beings rarely are—as he probably had, for a time at least, to take the place at the wheel of his slain companion. In a somewhat similar anecdote given by Jesse, the injured brute acted with more forethought. On one occasion—so goes the

story—when the cook at the Jesuit College at La Flèche required the spit turned, the dog that should have been on duty was nowhere to be found, and when the man would have employed another, it bit at him and ran away. In a little while, however, the latter animal reappeared, driving before him the one that would have evaded its duty, which he forced to enter the wheel and go on with the work. Anecdotes of the dignified and even magnanimous way in which large dogs avenge themselves for insults upon smaller members of their species are exceedingly numerous, and generally too well known for citation here. Dr Hancock, in his *Essay on Instinct*, alluding to one of these instances, in which a Newfoundland dog dropped a troublesome cat into the quay at Cork, and then, when it was struggling for life, plunged in and saved it, remarks, that 'it would be difficult to conceive any punishment more aptly contrived or more completely in character,' adding, that 'if it were fully analysed, an ample commentary might be written in order to show what a variety of purposes and motives and generous feelings entered into the composition of this act.' A very interesting instance of the sagacity with which these Newfoundland dogs act, and the way in which they retain their resentment, is afforded by Mr Watson. He tells how a gentleman on arriving at his country home, in the neighbourhood of London, discovered that he had brought with him a key that would be needed during his absence. He had with him a Newfoundland dog that was accustomed to carry things, and so it he intrusted the key. On its way to town with the key the poor creature was attacked by a butcher's dog, but attempted no resistance, and only used its powers to get off with its charge. It delivered the key safely, and then on its way home stopped deliberately before the butcher's shop until the dog again came forth, when he attacked it furiously, and did not leave off until he had killed it.

Elephants are proverbial for the retaliatory means they adopt in repayment of injuries or insults inflicted upon them, in many instances, thus deeds of vengeance have quite an air of poetic justice about them. We recently recorded one of the most singular cases on record (No 977), in which an elephant avenged himself on two individuals who had separately abused him. And who has not heard of that characteristic story related by Mungana Nivante, of the Macassar elephant upon whose skull the driver had cruelly cracked a cocoanut, in return for which, the infuriated animal availed itself of the first opportunity of reversing the offence by breaking a cocoanut on the man's head, and by so doing killed him? Many similar instances are related of terrible vengeance inflicted by these creatures upon those who injure them, but in some cases their revenge takes a ludicrous turn. The tale of the Delhi elephant and the tailor is too well known to call for recapitulation. Another anecdote is related of an elephant that was known as the 'fool,' but which proved the injustice of that appellation by the revenge it practised upon a quartermaster, who, irritated at its persistent refusal to carry more than a certain weight of baggage, flung a tent peg at its head. A few days later, as the animal was

going through the camp, it overtook the quarter-master, and seizing the man with its trunk, lifted and deposited him in a large tamarind tree, leaving him to get down as he best could.

Elephants, indeed, are very sensitive to insult, and would appear frequently to be more annoyed at anything derogatory to their dignity than at actual pain. In a well-known work on natural history styled *The Menagerie*, it is stated that as an elephant was passing through the streets of London, a man seized it by the tail, an indignity that so offended it, that it grasped him with its trunk, and placing him against some iron railings, kept him prisoner, until persuaded by the keeper to let him go. Captain Shipp has recorded in his *Memoirs* that an elephant drenched him with dirty water for having put cayenne pepper on its breast and buttocks.

The Rev. Mr. Watson gives a very curious story in illustration of this animal's wonderful long memory of a wrong suffered. One of those parts of society, 'a practical joker,' visited a caravan in a West of England fair and traded his stupid tricks upon an elephant there. He first dived out to it, one by one, some gingerbread nuts, and when the grateful animal was thrown off its guard, he suddenly proffered it a large parcel wrapped in paper. The unsuspecting creature accepted and swallowed the lump, but immediately began to exhibit signs of intense suffering, and snatching up a bucket, handed it to the keeper for water. This being given to it, it eagerly swallowed quantities of the fluid. 'Ha!' cried the delighted joker, 'I guess those nuts were a trifle hot, old fellow.' 'You had better be off,' exclaimed the keeper, 'unless you wash this bucket in your head.' The fool took the hint only just in time, for the enraged animal having finished the sixth bucketful, buried the bucket after its tormentor with such force that had he injured a moment longer his life, he would have been foisted. The affair had not, however, yet concluded. The following year the show revisited the same town, and the foolish joker, like son of his genus, unable to profit by experience, thought to repeat his stupid trick on the elephant. It took two lots of nuts into the show with him—sweet nuts in the one pocket and hot in the other. The elephant had not forgotten the jest played upon him, and therefore accepted the cakes very cautiously. At last the joker produced a hot one, but no sooner had the injured creature discovered its pungency than it seized hold of its persecutor by the coat tails, hoisted him up by them, and held him until they gave way, when he fell on the ground. The elephant now inspected the several nut-tails, which, after he had discovered and eaten all the sweet nuts, he tore to rags and flung after their discomfited owner.

We will now refer to the methods of revenge adopted by animals in another race. Apes, it will readily be comprehended, are very dangerous creatures to arouse the enmity of, as they will dare anything in order to avenge their wrongs, and are most ingenious in adopting schemes of retaliation. Many of their deeds of revenge are well known, but the following anecdote, related by Vesuvius, the Italian biographer,

will be new to many of our readers. Il Rosso, a disciple of Michael Angelo, resided in Florence, in a house overlooking a garden belonging to some friars. Il Rosso possessed an ape which was on very friendly terms with one of his apprentices called Battistoni, who employed the animal to steal the friars' grapes, letting it down into the adjacent garden and drawing it up again by a rope. The grapes being moved, a watch was set, and one day a friar caught the ape in the very act. He tried to inflict a thrashing; but the ape got the best of it, and escaped. Il Rosso, however, was wiser, and his pet sentenced to wear a weight on its tail. But few days elapsed ere the culprit had an opportunity of avenging this insult. Whilst the friar who had detected and punished the creature was performing mass at a neighbouring church, the ape climbed to the roof of the monks' cell, and, to quote Viviani's words, 'performed so lively a dance with the weight on his tail, that there was not a tile or vase left unloosen, and on the friar's return a torrent of lamentations was heard that lasted for three days.'

#### A REMINISCENCE OF SIR WALTER SCOTT

In my youthful days in Edinburgh, a trifling incident—but to me a rare piece of good fortune—occurred in relation to 'The Author of *Waverley*,' which it gives me pleasure to record.

In those early days I was an enthusiastic reader of his works, and was in the habit of frequently looking in at the Court of Session, in the old Parliament House of Edinburgh, where Scott, in his official capacity as one of the clerks of Court, used to sit while it was in session. I always endeavoured to get as near him as I could, to gaze upon that noticeable face and head, which, once seen, could never be forgotten, and I used to wonder by what process that magical genius of his had evolved from the past such a gallery of real men and women—in number and variety almost approaching Shakespeare—with all their loves and hates, their joys and sorrows, their strength, their weakness, their stabilities, their devotion, and homely simplicity—his manly, healthy genius redolent from all taint of exaggeration or sentimentalism the characters that live in his pages. I was a face in which were combined shrewdness, humour, kindness, keen perception, and sagacity, while to these was superadded a certain 'pawkiness' (to use a Scotch word which has no equivalent in English). He would now and then exchange words with the brother officials who sat beside him, or opposite to him, on the other side of the table. Often some joke would pass, and then his face would light up, and a smile break out and steal all over it, his merry eye and suppressed chuckle revealing the scene of humour that had stirred him. Here I may say that Chantrey's well-known bust of him reproduces his usual expression with consummate fidelity. No bust of any one I have ever seen has so truthfully conveyed to me the living features as this one does.

It was in the summer of 1838, I think, now

fifty-three years ago, that a commercial traveller, a friend of mine, bound for Galahad, proposed to drive me thither from Edinburgh in his gig, and back again. As I had never seen Abbotsford, I eagerly seized this opportunity of being taken to the place. Having seen Scott in the Parliament House the day before, I concluded that he was for the time resident in town, and that there would be no difficulty in gaining admission to the house and grounds of Abbotsford. It was arranged that, while my friend was transacting his business in Galahad, I should walk on to the Tweed, on whose south bank stands Abbotsford, near the river, backed by 'Edison's triple height,' he turned across and returned in a few hours to my companion. It was a lovely day, and the fields and woods were in all their summer beauty. As the sun was high,

and the air was warm, I felt that I was in the land of the living. How good and expressive are Carlyle's words about him in his latter days! 'And so the curtain falls, and the strong Walter Scott is with us no more, a person from him does remain, widely scattered, yet attainable, not inconsiderable. It can be said of him, when he departed, he took a Man's life along with him. No wonder piece of British Manhood was put together in this eighteenth century of Time. Alas! his fine Scotch face, with its shaggy honesty, sagacity, and good nature, when we saw it lastly on the Edinburgh streets, was all worn with care, the joy all fled from it, ploughed deep with labour and sorrow. We shall never forget it, we shall never see it again. Adieu, fair Walter, deeds of butchery, take our proud and sad farewell!'

ALEXANDER IRVING

BOWDOIN, CHAMBERS

I saw Fawcett's silver stream  
Glistening in the sunny beam.

I was afraid across its rippling waves, then mounted the gravel bank on the other side, and presented myself at the entrance to the house, full of delightful anticipations of the treat I should have in seeing the interior of the den of 'The Wizard of the North.' The old man servant who opened the door to me expected that I could not be admitted, 'because,' said he, 'the 'Squire' is at home and in the house, and strangers are not admitted when he is here.' Thus my first visit to the clouds all at once vanished, and I stood thoughtful and disappointed, telling the old man that I had come all the way from Edinburgh that day specially to see the place, and that I had never dreamed his master was at home, having myself seen him in the Court on the previous day. 'Ye see, sir,' he replied, 'he comes out here whenever he can get a day even when the Court is sitting.' He came out that night. If I cannot be helped I'm sorry to see him the trouble o' coming one far for nothing. At that moment, about himself, coming out of a room entering from the garden, he reached the hall entrance where I stood, on his way to the grounds. He was clad in a homely suit of black and white cloth, and had a belt round his waist, in which were stuck a hatchet, a hammer, and a small saw, while two large dogs gambolled about him, leaping up against him in their eager fondness, and presenting their heads to be patted. 'What's the young man's business?' said he, addressing the servant, who reported to him what I had been saying, while I stood with my heart beating furiously the while. Before I could gather courage to say a word for myself, Scott, turning to me, said, 'As you have come so far, young man, to see this place, you must not be disappointed, so you can just pass through the house, and see whatever you like—Good day, sir.' Before I could thank him, he passed out into the grounds, the dogs still leaping up upon him, he pushing them off and playfully scolding them.

This was my last glimpse of Scott. At that time he was working hard, with steady persistence, to retrieve his misfortune and pay his creditors. He looked paler than usual, and was nervous and anxious. This was about three years before he

# BY THE SEA.

They lingered north the spreading thorn  
The snow white blossoms fell on her hair,  
Athena her face the sunbeams lay,  
And I love you young, and life was fair.

'Only me little you, they said,  
Then parted at her cottage door—  
He sailing westward with the tide  
She, happy, waiting by the shore.

Two long long years! I came slowly down  
When Hope is gone for evermore,  
The days seem weeks, the months seem years—  
And still she watches by the shore.

The ocean is a clover red and gold  
And shells and their treasures lie on it,  
And by one day we bid her  
As fading memories of a dream.

'The ocean, and the glowing sun  
Stoops down to kiss the purple sea,  
The sunny waves like wind blown clouds,  
Break on the rocks unconsciously.

Slowly the gray mist creeps a town  
The darkening billows by the bay,  
Long birds are hushed, night stars appear,  
And daylight dully wakes the way.

In bitter agony she moans—  
Her words will come through hearts may break  
'O dreamy wand, O mad and vain,  
Lead me to sleep, nor let me wake.'

At last it felt that brought the storm  
That night, and wrecked the 'homeward bound'  
While in the gray dawn, met at last,  
The broken ends by odds were found.

At last at last, but cold in death,  
The salt sea dripping from his hair,  
And she—That upward face can tell  
How heaven had heard her weary prayer.

A. M. MACGILLIVRAY.

## SHIPS AND SAILORS

■ the nineteenth century has caused an unceasing modification in the conditions of labour afloat, it has affected still more profoundly the lot of those who toil on the sea. The ancient mariners who manned our warships and mercantile marine a generation ago, were quite a different race from those of the present day. In dress, in discipline, in ideas, in aspirations, the modern seaman differs from his predecessors, and each year induces further changes, such changes being inevitable, from the hour that ships began to be influenced by the accelerations of the century.

Steam navigation demands men of a different type from those who floated leisurely in the 'wooden tub,' as wind and weather permitted. In defiance of the hurricane, in the teeth of adverse gales, in mockery of the 'doldrums' and calms of every sort, the steam-driven vessel goes on to her destination. Voyages that once occupied months have been reduced to weeks. The sailor's mind is kept in a state of continual activity. His personal share in the conflict with nature is greatly reduced, and each development of modern navigation tends to merge the mariner into a part of the floating machine.

In the sailing ship, individual bravery and smartness had immense scope for display, when storm and man fought for mastery in the giddy heights where topsails lent under the sun-like coachman's whip. No coward was equal to the conflict that raged in that upper region, no bungler could foul the staggering sail, that wrenched and strained like a living thing. Monkey-like agility, heroic courage, devil-devil emulation, were needed in the fearful crises in which every sailing ship was exposed. The wild timeless lands who 'would go to sea' found in the storm those terrific antagonisms that brought out the man in them, and the wild energy of nature and humanity were thus happily neutralised.

On board steamships, there is no need of such men. Thoughtful, cautious, reflective navi-

gators are wanted, who know how to elude the whims and caprices of Neptune, and who can contrive to get at the secret of the old gods' humours, instead of merely battling with them. Meteorology is studied, ocean currents are tracked, the genius and behaviour of storms essentially examined. The grand object is to get from port to port with the utmost celerity and certainty—to make ocean voyages as calculable as land journeys.

Seamanship has entered upon an absolutely new phase, and demands men of another kind than the gallant but slow-witted sea dogs that had suited earlier times. For, mingled with the bravery of these ancient tars, there were superstitious and prejudiced notions that made them hostile to the march of the age. Long after ghosts, goblins, and portents ceased to have any influence upon the conduct of landmen, they continued to inhabit the fort-castle and to keep company with the night-watch. 'Davy Jones' was honoured and feared, when his fellows whose work was called into eternal oblivion. The old-fashioned sailor, when making his money by with his boon companions at home or abroad, was a man of rough morals. His oaths were appalling, to 'long-shore men,' his conceptions of religion strangely pagan. But on board ship, amid the solitude of its monastic routine, away from rum and riot, swinging between high heaven and the unknown depths of ocean, a tar in the immensities of sky and water, the now sobered tar became deeply conscious that he lived among preternatural marvels, and that the phenomena surrounding him were stupendously mysterious. The fearful things that passed over the firmament and the sea, awful darkness painted with lightning fires, black night now glowing with phosphorescent gleams, sunsets like a world in flames, unmoving ocean like an infinite pool of blue oil, raging, pitiless, invading ocean, white with deadly passions, leaping like a live thing over the bulwarks, and searing the seaman with a mighty clutch—all these variations of nature's moods had deep significance for sailors. Baleful sprites had much

to do with the monstrous agitations that supervened in the watery world. It was needful to be on good terms with them. Science attempting to explain the origin of tritons, the phosphoric essence of the sea, the Gulf stream, trade winds, and other wonders, was considered as a dangerous, almost blasphemous meddling with the concerns of the malign powers pursuing over them the department of the world.

But superstition faded under the dominion of steam at sea, as it did on shore. Davy Jones has become as dubious as Neptune, and is no more propitiated than *Estlin*. The present order of mariners is on the wane.

If sailors have become men of another order, ships have been more multiplied by the endless inventions of the past half century. From the origin of navigation until our own times, wood was the only substance employed for floating men and freight over the wide ways of the world. We have changed all that, and now metallic ships are fast supplanting wooden ones, so that in course of time, a vessel of the old type will be as great a curiosity as the cross of a Viking.

Before iron began to supersede wood, metallic rigging had commenced to supplant hemp, to the derision of sailors and rope makers, who prophesied that such iron-fangled notions would be ruinous to our maritime supremacy. Improved steering apparatus met with the same objections, machines for furling sails were looked upon with contempt by those in a who were to be benefited by them. But to go to sea in an iron ship seemed the very epitome of absurdity. *Strom* had been a faithful illustration of lunatic notions upon the sea, but this building ships of metal, which is every one knows like a stone in the water, was little better than a crime. The wreck of the *Great Britain* upon the coast of Ireland gave an immense poignancy to the criticism of objecting sailors. There was a signal instance of what these iron monstrosities would come to. The *Great Britain* was the pioneer of the metallic fleet that was to drive the wooden ships out of existence. Lying upon the Dundrum shore, she was a broken warning to keep clear of such mad innovations. After for old and untimely conclusions the *Great Britain* was lifted from her supposititious final resting place, and became the most famous, successful, and profitable ship of her time. Thousands of passengers were transported by her to Australia, and vast quantities of the new gold were brought by her to England.

The *Great Eastern* was another example of failure that did not expect to influence. Truly, Brunel's Leviathan has been unprofitable to her owners, from the time of her launching until the present hour, she has been a maritime white elephant. But it is a pity that individuals should have to bear the charges of the giant audacity that Brunel perpetrated, for the *Great Eastern* has perhaps done more to civilize civilization than any other ship that has sailed the sea. By her indispensable aid, the Atlantic telegraph cable was laid, an instrument which has blessed mankind, and will for all future time. If the inhabitants of Europe and America ever feel grateful for the improvements of the past twenty years, they should not forget how much the *Great Eastern* has contributed to them.

Besides her aid in telegraph development, the

big ship furnished the experience that is now causing so great a change in the tonnage of our merchantable fleets. For years after her construction, it was universally believed that she was the first and the last of the Leviathans. Her voyages had been marked with disasters, which were attributed to her unmanageable proportions. Then, instead of chipping through the ocean billows as steadily as a train running on a level, she rolled like a vast log in the water, and so far from diminishing accidents, inflicted special agonies upon her passengers. And a yet more serious objection was urged, that in case of shipwreck, the loss of life might be appalling, for the *Great Eastern* could carry four or five thousand emigrants. The same objection applied to her as a military transport. In an emergency, ten thousand troops could be crammed by her, and it was urged with much plausibility, if she went down with such a large proportion of our small army, that a national panic would result. So the *Great Eastern* has proved the utter past of her existence like a worn out hull.

She furnishes another instance of the great law of progress—namely, that invention must wait on experience. Brunel and his financial supporters were ahead of their time. Now, mankind have begun to catch them up. Further invention, the more urgent demands of our broader civilization, improved navigation, the spread of population in the United States and Australia—all these compel ship owners to increase the dimensions of their vessels. Each year the comparisons between the first Leviathan and her sisters grow less, and it is not rash to believe that even the phenomenal proportions of the *Great Eastern* may yet be surpassed. The *Sitta*, the *City of Rome*, and the recent *Aurora* of seven thousand five hundred tons, prove that a great change has come over the opinions of those concerned with ocean transport.

The whole tendency of our time is towards the aggragation of effect—the mixing of capital and labour. A ship of five thousand tons can be built cheaper than five ships of one thousand tons. In the working, there is a still more striking economy. One captain, instead of five, and so on through the whole crew, engineers, stewards, and the rest. In the passenger for passengers, five thousand cost less than one thousand, yet particularly. Now is that all. Large ships can be perilled quicker than small ones, in the worst conditions of construction, engines, and propellers be observed. Large ships have more space for coal stowage, a most important matter in ocean traffic, for the economy of time and money. These considerations are further swayed by several great advances in marine engines and in the material of the hull. Compound engines introduced a vast economy into steam navigation, but with improved boilers and methods of generating steam, a still greater economy will be effected, and it may soon come to pass that our ocean Leviathans will be driven with a much less coal expenditure than at present, and by propellers more powerful and more easily managed than the screw.

Speed, however, has become the first desideratum of our time. But speed must be accompanied by safety. What the traveller wants is to get quickly to the end of his journey, not to the end of his life. In this all important

question of safety, some of the shrewdest minds have been and are still engaged. Ships are built in floatable sections, so that in case of wreck or collision, if one part be injured, the others will not sink. Indeed, it followed as a matter of necessity that iron ships should be made buoyant by novel devices, seeing that in case of disaster, wood had the advantage. Thus, the effort has all along been to join strength with elasticity. Recent improvements in making steel, now plied in the ship builders' hand a material that seems equal to any mishap that even ocean navigation may be liable to. Mild steel appears to be a sort of metallic india rubber that will stand any amount of strain, or impact, without fracture. For some time steel has been taking the place of iron, from its greater strength and lightness combined, now that this new kind is introduced, having still greater advantages, and as the cost of it will be doubtless reduced by its growing employment, we may see an acceleration of the maritime revolution which has been going on for half a century. The ships which are swift and sure will certainly drive out those which are slow and unsafe. Competition is feverishly active in every branch of business, and in none more than in the mercantile marine. The *Albatross*, of the Guion Line, has shown that the Atlantic can be crossed within seven days, not by good luck, but by good engineering, in a regular navigation. Messrs Inman have decided the *City of Rome* because she has not sailed, and they doubtless will replace her by a ship that will at least equal the *Albatross*, perhaps surpass her. At any rate we may be sure that Messrs Inman will avail themselves of the best advantages in steel architecture and engineering.

Not is it only among British ship owners that competition of time, there are some on the other side of the Atlantic that the ocean is to be crossed in a yet shorter time than our own ships can boundly require. The *Albatross*, a new building on the Hudson is expected to go from New York to Queenstown in little more than five days, she is to run at the rate of twenty five miles an hour. In many respects, the *Albatross* is a marine novelty, built, it is said, so as to slide through the Atlantic with instead of over it. She has no masts. Experience alone can demonstrate if she is to accomplish what her designers expect, but whether she fails or not, it is certain that the next few years will witness many further experiments in ship construction, in methods of propulsion, and in economies combined with both. M. Besoul Pictet, the eminent engineer of Geneva, is said to be engaged upon a new system of ship building, and from his remarkable achievements in other departments of physics, it may well be that he will win further success in this new field. It is said that he expects to cross the sea at the rate of thirty seven miles an hour. Such speed would produce an extraordinary change in the commercial relationships of mankind, and would hasten the redistribution of nations that is now going on so fast in America and Australia.

And lately there has entered upon the scene a new agent, that may have incalculable results upon navigation and navigation. It is electricity. A year or two ago the public of Paris were shown an electric boat, designed by M. Tréville, and

experimented by him upon the Seine. Although but a huge toy, it proved that electricity was capable of being applied as a maritime motor. The experiment was quite as successful as the early attempts to propel vessels by steam, and those who knew how great the progress of electrical art has been since then, had no doubt that it would eventually be applied on a larger scale. Now it has come to pass. On the 29th September 1881, an electric launch, twenty six feet long and five feet broad, drawing two feet of water, having on board four passengers, went from Millwall to London Bridge—a distance of nearly four miles—at a speed of eight knots an hour against the tide. The return journey was made in twenty four minutes. It was calculated that the electric energy expended was equal to three and one eleventh horse power.

This striking proof of the capability of electric propulsion will soon be followed by demonstration on a still larger scale, and in which the commercial value of such a motor could be further tested. After all, the question of navigation is decided by common sense. Steamships are superior sailing ships, simple in their construction, and a steamer is so much more than a sailing ship, and is much more capable of service. But it will make three or four voyages to the sailing one, and calculate its cost per mile sailed, and per ton of cargo or passenger transported, the steamer is found to be far cheaper than its rival. So it will be with electric ship—they can succeed only on their commercial merits. Electricity, however, is on the same tentative condition that steam was a century ago. Who can say to what extent the electric power may be applied on a hundred vessels?

But be this what it may, one thing is certain—sailing ships will be still further changed from the type of the ancient mariners. We know in our harbours, then they are to disappear, ships will disappear as the dinosaurs of the world, and the old rules are discarded. The Suez Canal has caused a revolution in itself, and if Panama be ever effected, the trade of the world will again be metamorphosed. Each improvement in the craft demands a corresponding improvement in the sailor, no longer is he expected to be a mere animal of toil, but an intelligent link in a chain of causes working out the welfare of the world. The steam tiller enables him to steer the huge monsters he controls as easily as a ship, the steam watch has relieved him of the labour of hauling, the rapidity of his travels from port to port has relieved him of the dreary monotony of long voyages, and better food and treatment have raised him in the scale of humanity.

In a word, the lot of the sailor partakes of the mechanisation going on among the humbler workers of the world. Although important however, the disadvantages attending its first steps, these disappear. No doubt the age of steam has introduced into our mercantile marine a vast number of dangers, to the injury of our own race in the matter of pay, and to the detriment of the nation's maritime strength in case of great and prolonged naval war. But such was inevitable, as Great Britain has supplanted the shipping of so many foreign nations. The decline of apprenticeship, the employment of 'ordinary' seamen, the

poor want of able seamen, and the profitability of the fishing industries, have all contributed to limit the numbers of British sailors, and thereby to increase the number of foreigners sailing under our flag. Still, the royal navy is manned by splendid fellows, as the Egyptian war proved, and in case of a supreme struggle with the naval powers of other peoples, England would find no lack of heroes to keep up her traditions.

And when the maritime business of the world has further developed, when Africa and Asia are further included in the domain of international commerce, the condition of the British sailor will be higher than at any previous time. Taking him altogether, he is the best manner that sails the sea, and he is better capable of adapting himself to changes than his competitors. What ever be the advantages of other nations in soul, climate, or industry, the British, as the carriers and navigators of the ocean, have no superior, and the progressive civilisation of the world means the increase of our maritime grandeur.

## ONE FALSE, BOTH FAIR;

OR, A HARD EIGHT

### CHAPTER III.—LANDING AT SOUTHAMPTON

SIX days after the eventful night when the white squall had tested the endurance of ship and crew, the fine *Pennamoor* and *Oriental* packet *Cypria* was gliding through the placid tide that filled Southampton Water, due to yachsmen, and hourly beat high, and eyes brightened or grew dimmed with tears, as the expectant passengers prepared to disembark on British ground. Then came the bustle of the actual landing, the noise, stir, and confusion, the hurried farewells to those who had of late been constant companions, but whose mutual memory would soon sink into the casual recollection of a pleasant travelling acquaintance, and next the rich and iron clang of the vast train speeding Londonwards, leaving with it all the passengers with the exception of the two sisters, their servants, and Arthur Talbot.

Half an hour later, a train was ready to start for the West, and by this the Marchioness and Miss Carew were to take their last journey to the splendid home which the widowed lady and her young husband had quitted but a year ago.

'This is very kind of you, Mr Talbot,' said the Marchioness, as their last fellow traveller, having placed Lady Leominster and her sister in the railway carriage, still lingered at the door, while the servants bustled to and fro in their professional anxiety for the safety of the baggage.

'I am an idle man,' answered Talbot, smiling, 'and my home, as I think I have mentioned, is but a short time mine now.'

'It is called Oakdene Hall,' said Miss Carew, 'is it not?'

'Yes,' replied the young man. 'Oakdene is the name. The old house should be shattered by your remembrance of it.—Though it would seem but a poor little nutshell of a place, Lady Leominster, beside Castel Vawr.'

Then came the parting, that conventional

'good-by,' that may mean so much or so little, now hastily or mechanically uttered, now fraught with a tender sadness or agony of regret. Arthur Talbot's voice was not quite steady as he returned the Marchioness's farewell, and released the little hand that she held out to him from the open window of the railway carriage. As the train slid away from the platform, he remained motionless, following it with his eyes until it was lost to sight, and then turning away, walked slowly and musingly, almost sadly, to the hotel where he knew that he should find his carriage. He had ordered it to be in readiness to convey him home. Home! Oakdene was the abode of his boyhood certainly, and he had a lingering attachment to the place, but the red brick Hall of Queen Anne's reign had been very little of a home to him since he had come, perhaps too early, into possession of his small estate. There was no one at Oakdene who loved him, and would await his coming with the eagerness of affection, only servants more or less faithful, who regarded the visits of their young master, rare and brief, from their own point of view.

London, Paris, Italy, had seen much more of the young Squire of Oakdene since he attained his majority, than had his own quiet acres of pasture and arable and woodland. It was in London that he had reckoned among his dearest friends the late Lord Leominster, but that was in the latter's bachelor days. When the Marquis married, Talbot was shrewd, and their next and last meeting took place far up the Nile, when the world and its passions and vanities had come very nearly to an end for the Most Honourable Wilfrid of Leominster. Then their paths of travel again diverged, and it was by the merest chance that Arthur Talbot found himself a passenger on board the steamer in which the widowed Marchioness and her sister were returning to England. Some how, on his homeward drive that day along the familiar road, and as he sat idly onwards at his solitary dinner, with the old portraits of long dead Talbots, his ancestors, like silent friends, gazing him from the walls, the image of Lady Leominster, gentle, sweet, and beautiful, was seldom absent from his thoughts.

Meanwhile the train, throwing behind it miles and leagues of moor and meadow and forest, vast of sprouting corn and ranges of hump-backed downs, waited here and there by white cuttings that lulled the chark, reached the rougher and wilder landscape that lay far to the north-west. Those blue Welsh hills that towered, almost threateningly, though the bare of the horizon, how often had they frowned defiance on the invader, from the day when the Roman legionaries under Ostorius, warily plodding on, with sloped spears, in weary march eyed them, until that which saw King Henry's last expedition against rebellious Glendower. These were the fastnesses to which the beaten Britons had been driven back under storm of Roman swords, and whence the wild clans of the Cymri made raids the rich lands for ever torn away. Those times were gone, like the birds and the drake, and no bad number was needed now to hold his fast by mallet and spear, as when the Most Noble the Marquis of Leominster was a Marquis indeed, with a mark to guard, and scarce necessary foes to keep back from harrying

the peaceful hills on the English side of the Border. Yet yonder rises on the eminence, with dark woods around it, Castel Vaux, flanking back the mountains as of old, more beautiful, if less strong, than before the mantling ivy and the drooping foreglove and tenuous hundred had clung to its venerable towers, and before the once new white Norman masonry had assumed the picturesque grayness of hoary age.

At a tiny station, where, nevertheless, other than parliamentary trains were wont to stop, wire railway Companies are accommodated along with a great landowner and a pair of the realm contained, within easy reach of Castel Vaux, the two sisters alighted. There were courages from the Castle in waiting there, and a foreman for the luggage, and black liveries, and a respectful little rustic crowd of frontier folk, who hardly knew to which nationality, Celtic or Teutonic, they belonged, who talked English in the alehouse and sang Welsh hymns in chapel, but who took off their broad-brimmed West country hats with a low manner of mutely reverent, as the widowed mistress of the great estate passed through the midst of them on her way from the platform to her carriage. That carriage, with its sable harness cloth and coroneted panels, blazoned emblems of rank and was, rolled off, swiftly and smoothly, along the well-kept road. It was bright spring weather, the lark, carolling aloft, the waxy chiffinch chirping from the apple boughs that overtopped the woodland clambered hedgerows of some cottage garden.

But the occupants of the carriage, as it traversed this smiling landscape, had remained silent, until at length one of them rose almost timidly, in a low sweet voice that was broken by emotion. 'I hope, my darling sister, that we at least shall never be parted. I have but you in the world now, remember, and we two should never separate.'

With some slight start, even as of purplish surprise, but with ready tears welling up to her gentle eyes, she who was withdrawn bent forward to kiss the speaker's pale cheek. 'We never will, dearest, if the chance is with me!' she said softly, and then the two sat for some moments hand in hand, but mute.

The carriage had by this time reached the lodge gates of the simple Park, and was rolling along amidst green lawns and bowery dells, beloved of the fallow deer, under the arching oaks of the grand avenue.

Again was heard that sweet tremulous voice. 'I do hope, love, that we shall both feel equally at home at Castel Vaux, as we did once at poor shabby old Crevin. I do hope that it will be your home, dear sister, while I live, as well as mine.'

Again the look of pain and surprise crossed the listener's fair face, but the only reply was a smothered sob, for just then the carriage dashed up to the stately front of the Castle and came to a stop before the great doors, wide open now, while a muster of liveried servants stood on the broad stone steps waiting to welcome their mistress.

In the great drawing room of Castel Vaux, the many windows of which commanded a matchless prospect of vale and river and the bold chain

of the Welsh mountains beyond, sat Lady Fairbairn, a spinster aunt of the late Marquis, tall, upright, and dignified, with aquiline features and iron gray hair smoothly brushed. Unusually vocal (this was not unfrequently remarked of Lady Barbara) that she was as cold as an icicle and as hard as a flint, but the remark was not quite just. She was a proud woman, nothing more, but then nobody loves the proud if pride implies unkind reluctance. The silent are always a discount in society, and very few of us have eyes keen enough to penetrate the defensive armor of such as Lady Barbara. She was not proud because she was a Lady Barbara—not in the least. With her the pride was quite innate, and would have made itself obtrusively manifest had she been the daughter of the prettiest village shopkeeper. As it was, it centered in the strongly felt remembrance of her recent losses, and in the appreciating of a semi-fudal splendour and dignity of deportment doubly dear to her because nothing else had ever awakened her high fancy.

Two thirds of Lady Barbara's life had been spent at Castel Vaux; and yet she was by no means dependent either on her brother the farmer, or her nephew the late Marquis. An early betrothal had made her rich. She had a London house, had the claim to live in it, and a handsome income, had she cared to spend it, but she clung to the Border Castle with an attachment that was absolutely catlike, and her great fear had been that she might have lost the house that was her birthplace, as the chieftainship of the family might now devolve upon a cousin. That fear, however, was happily avoided. The late Marquis had possessed an unusual power of making splendid attainments for his young wife's benefit, and Clara was to have the castle and lands for her life. Lady Fairbairn had not much apprehension that the untoward Lady Leconneret would either object to her continued residence beneath that stately roof, or interfere to any serious extent with her customary household arrangements. The Marchioness would reign of course, as titular sovereign, but here was still to be seen like that of some Merovingian king of France, with Mrs. Lady Barbara for a petticoated Mayor of the Palace.

Lady Barbara was not on this occasion alone. With her was the family solicitor, Mr. Pontifex, of the well-known firm of Pinner and Pontifex, who had journeyed down from Lincoln's Inn expressly to receive the widow of his late noble client on her first arrival in absolute mistress at purely Castel Vaux. These hereditary lawyers often come to console themselves as part and parcel of the great families whose marriages and marriages death they have continued to drink, and whose feuds and weaknesses and whims have been laid bare before them for two successive generations. Pinner and Pontifex, who were, so to speak, legal confidants to half the peerage, had a special argument for the House of Montgomery-Leconneret. Mr. Pontifex himself, a round little man, with gray whiskers, gold-rimmed glasses, and whitish-pinkish face, looked very like a country banker or land-agent, and not in the least like the ideal of a London attorney. His manner was at once bland and abrupt, perhaps jerky, and he took a good deal

of strong, scented snuff from a costly box, the valued legacy of a duellist long deceased.

'How fortunate, as I said before, that poor Wilfred was so thoughtful,' said Lady Barbara, after a pause, during which lawyer and lady had alike been listening for the expected sound of wheels, 'and that he was able, too, to dispose of his own. For otherwise, Adolphus Montgomery would have been master here, and Cecil Vane could have been no home for me any more.'

Adolphus was the name of the new Marquis of some weeks date, and Lady Barbara could not endure as yet to speak of him otherwise than by his plain Christian and surname, while even those she pronounced with a little pardonable irritation. It provoked her that the Leinster coronet should have paid away from the main stem—her own—to a younger branch, descended from a half-forgotten cadet of long ago. Such feelings may be foolish, but they are not unnatural. Be sure that Marguerite de Villos, divorced wife and divorced queen of the Orléans, had her own private notions as to the mushroom pretensions of the then upstart royal House of Bourbon de Nemours. The remark was transparently selfish, but it did not escape Mr Pontife, who merely showed his white front teeth as he replied, 'Very fortunate! The present peer, however, will—Ah! there the carriage!'

### IS THE SUN WASTING?

DURING the last twenty years, the subject of the constitution of the sun has attracted very great attention, not only amongst scientific men, but amongst intelligent readers of books and newspapers. We think it therefore of interest to give our readers a popular account of the different theories upon the sun's heat, and especially a new one bearing the name of Dr. Schuster, whose reputation is so well known from his discoveries in mathematics and electricity, and who filled the chair of the British Association for the Advancement of Science at its meeting at Southampton.

Most of our readers doubtless know the chief figures which denote the dimensions of the sun, especially since the names of Venus eight years ago led to a correction of the distance of the sun from the earth, according to the figure that had for many years been accepted. But perhaps not so many persons have noticed the enormous figures that represent the heat of the solar orb, as contrasted with the figures that we are familiar with on the subject of terrestrial heat.

The volume of the sun is about one million three hundred thousand times that of the earth, and its distance from us, in round numbers, about ninety-three millions of miles. And since we all of us every day see the wonderful effects of the heat and light which even this little ball of ours receives, we can form some faint idea of the enormous amount of heat continually given out by the sun and the prodigious work that must be going on. And if

we would form any real estimate of this heat and waste, we must remember that all the light and heat which we receive by the earth and other planets is a very small proportion of the amount that is being continually poured forth. It might be shown, with a moderate knowledge of geometry, that the amount so shed into space, where there are no planets to receive it, is two thousand two hundred and fifty million times as great as that which is received by all the planets which form our solar system.

We naturally ask, 'What is the condition of a body which is capable of throwing out for thousands, and perhaps millions of years, so vast an amount of light and heat?' For it has been computed that the temperature of the surface of the sun would be expressed by eighteen thousand degrees of Fahrenheit's thermometer, or between thirty and ninety times the temperature of boiling water. This is about five times the highest temperature that man is able to produce by artificial means. Also the light given off from this same surface is computed as being five thousand three hundred times more intense than that of the molten metal in a Bessemer converter, though that is of an almost blinding brilliancy. Or if we compare it with the oxy-hydrogen flame, the sun is a light equal to a hundred and forty-six times the intensity of the lime light.

So intense is the heat of the sun, that no known substances could remain in a solid form when subjected to such a temperature. Hence it has been concluded that the entire orb, vast as it is, is in a condition of gases altogether void of any trace of liquid or solid substance; moreover, that the outer visible surface of the sun flows like the surface of the sea, or rather like vaporous masses of cloud and misty air. But we must not suppose that this vaporous material is of little weight throughout the whole substance of the sun, for in consequence of the sun's vast size, the pressure in the inward portions must be so great through the influence of attraction, that the internal mass is believed to be denser than water. And as the late Professor Clerk Maxwell and others have shown that the viscosity or tenacity of a gas increases fast with the rise of its temperature, it is possible that the vaporous matter of the sun's interior would resist motion like a mass of pitch or putty.

When thinking about this enormous amount of heat, philosophers have naturally inquired whether it is being dissipated gradually, or whether it is by some means sustained undiminished, and if so sustained, by what means. There have until recently been put forth two theories on the matter, but recently a third has been broached by Dr. Schuster, and it has appeared in the *Nineteenth Century* under the title of 'A New Theory of the Sun'—that is, as regards the sustentation of its light and heat. We will mention the old theories in their natural order. First, all our everyday experience teaches us that when combustion is taking place, the substances which are giving out light and heat are parting with their matter, and turning it to various different forms, as steam and a residuum of ashes. We see this in the burning of a piece of wood or coal, or even a piece of paper. We do not say the substance is lost. If we could gather up

all the products of the combustion, we should find that they had not lost a particle of their weight, but that the form of them was materially changed. This, then, we conclude is the case with the sun. As we have stated above, the enormous light and heat which is being continually thrown into space, proves that the sun is converting much of its substance into other forms, and unless the waste be supplied from some external source, the material of which the orb is composed cannot fail to be gradually diminishing, though in the case of a body of such large dimensions, it must be a long time before there is any perceptible diminution either of volume or heat. But the loss of heat is by some believed to be compensated by the diminution of volume. Professor Newcomb, of Yale College, United States, has come to the conclusion, that with the diminution of the mass, the heat augments, and that, by this compensation, a shrinking of the mass might go on for five millions of years, and that it would then be eight times as dense as it is now. And he concludes that the present conditions of radiation of heat and light cannot have gone on for more than ten millions of years, and probably cannot support life on the earth for another ten millions. This theory, then, does not profess to provide for an indefinite continuance of the sun's present powers. And we may add, by the way, that even if we are led to contemplate the ultimate extinction of light and heat in the sun, it is no more than appears to have happened in the moon, which appears to be a dark and inert mass, the radiation of which has been perhaps stopped by some such tidal action as we know is in work upon our planet, and very slowly, but steadily, retarding our diurnal rotation. That the moon does not rotate is manifest from the fact that it always presents the same face to the earth. The first theory, then, does not profess to show that the sun's waste is repaired from without.

The second theory is, that the waste is repaired, both in volume and heat, by the continual impact or striking of meteors upon its surface. This theory is due to Dr. Mayer of Hambro, and was published in 1848. It was enthusiastically received by Sir William Thomson of Glasgow, one of the greatest physicists of the day, and who is especially known for his successful matches in electricity. It is well known that if a body when moving rapidly be suddenly stopped in its course, heat is the immediate result. We may see this exemplified when a bullet is fired against a stone wall, the lead becomes heated. This theory supposes that the sun is being perpetually hammered like a ponderous anvil by falling meteors, and that its heat energy is maintained as a lump of iron is kept hot by the vigorous blows of a blacksmith. Various calculations have also been made as to the amount of heat generated by the impact of a small planet, or other mass, the weight of which can be computed. But surely if there were falling continually on the sun such a mass of matter as would repair the regular waste, the earth would meet with a good deal more of such matter than it does in the periodical meteoric display in November and other seasons, and the orbit of the planet Mercury, which is the nearest known of the sun's satellites, would exhibit some traces of this

powerful influence. We can therefore hardly attach much weight to this theory.

We now come to the new theory started under the powerful name of Dr. Siemens. It seems very probable that this theory has been suggested by observation of the regenerative gas furnace of which he and his brother, Herr F. Siemens, are the originators, wherein the surplus heat, which has not been at first utilised for work, is returned through a central regenerative chamber to the gas and air about to be burned, before the waste products, with which it was previously associated, are sent up the chimney.

Dr. Siemens starts with the following assumption, that all the space between the planets, and even between the fixed stars, is filled with some thing of a much more substantial character than imponderable ether. Many of our readers will know that the phenomena of light have been for many years explained by what is termed the undulatory theory of light, which presupposes the presence of a very subtle fluid termed ether, pervading all space, and that the vibrations of this ether produce all the phenomena of light, including the variety of colours in the rainbow, or as seen in a prism. But Dr. Siemens's new theory of the sun demands the presence of a much more substantial medium. We cannot here go through all the considerations which have led him to his conclusions, but may briefly state that he considers that the materials thrown off from the sun by its energetic action are through the presence of this gaseous medium 'dissociated' or resolved into elementary substances, and when so resolved, burst into flame under the influence of the heat, and are turned back into the compounded state, as hydrogen is converted into water upon earth with the evolution of flame. Then he assumes that the matter so converted is acted upon by the sun's attraction, and redrawn into the mass of the sun by its enormous gravitating power. Our author is careful to guard his theory from being looked upon as one involving the idea of 'perpetual motion,' but it certainly presents an appearance of such a principle. First, light

We can but briefly discuss the great difficulties that beset the reception of this theory. In the first place, it is needless to prove that this gas, upon the existence of which the whole theory rests, has any existence at all. And there are three too many objections to its presence. If this vapour be dense enough to arrest the heat rays of the sun, and to convert them by 'dissociation' into materials upon which the sun's attractive power can have the ordinary influence of gravitation, then the flame, having the nature of a reacting medium, must have the effect of producing a retardation of the planetary movements, a result which, if it existed, would long since have been detected. And if it be not dense enough to produce this reticence, it is difficult to conceive that it can have sufficient coherence to enable it to arrest and deal with the heat emanations of the sun. Again, we observe in our own atmosphere that the smallest trace of watery vapour is sufficient to intercept the heat of the sun, and by formation of cloud, to shut the sun's rays from the earth. Surely, therefore, if the whole of space is pervaded by a gas containing the least amount of vapour, the sun's rays while passing through

that vapour for nearly ninety three millions of miles would be so intercepted that none of the effect of the sun's heat which we now enjoy could be felt upon the surface of the earth.

On the whole, then, we find it more easy to accept the doctrine of the gradual dissipation of the solar heat through the immensity of space, and the progressive exhaustion of the sun as a central power of light and heat, than to adopt this new theory, even though it is promulgated by so eminent a scientist as Dr Helmholtz.

## FOR HIMSELF ALONE.

A TALE OF REVEREND IDYOTITIES.

### CHAPTER III.

SEVERAL weeks had come and gone since Frank Frohisher heard the news of his good fortune from the lips of Mr Gimp. Eight weeks had come and gone since Dick Drummond's assumption of his friend's name and position, and the secret had not yet leaked out. To the world at large, including Mr Peabworth, Dick was the lucky Mr Frohisher who had dropped in for a fortune of eight thousand a year, while Frank was Mr Frohisher's secretary and humble friend. By this time they were settled at Wylands, a charming country house among the hazy hills, which Mr Arkew had bought and ready furnished a few months before his death, but which he had not lived to inhabit. Thence too the Peabworth had been invited.

It was a lively midsummer morning, and breakfast at Wylands was just over, when Mr Peabworth sauntered across the lawn, his arms laden with letters, newspapers, and prospectuses. The post-boy had just arrived, and he was anxious to secure a first glance at the news. He selected a rustic seat and table that were sheltered from the sun by the branches of a large elm, and there he sat down and proceeded to unfold his newspaper. Scarcely had he skimmed the first lines of the morning article, when a young lady in white and rose colour, with a straw hat, and a book under her arm, came stepping out through the open French windows of the breakfast room, and after pausing for a moment or two, put up her sunshade and walked slowly in the direction of Mr Peabworth.

The lady in question was that gentleman's only daughter, Miss Clara Peabworth. She was a tall, thin young woman, the regularity of whose figure not all the art of her dressmaker could effectually conceal. She had fluffy light brown hair, large prominent blue eyes, a well-shaped nose, and an excellent set of teeth, which she took every opportunity of displaying. The normal expression of her features when she was alone, or in the company of no one for whose opinion she cared, was one of quizzical discontent and misanthropic ill-humour. You are, she was five and twenty, and had not yet found a suitable partner for life. Some one had once told her that she looked 'arch' when she smiled, the consequence was that she smiled a great deal, but her smiles rarely extended as far as her cold blue eyes. Miss Peabworth was not one of those foolish virgins who believe in simplicity of attire. It may be that she knew her own deficiencies, and was aware that it would not suit her to play the part of the

Shepherdess of the Plain. In any case, even on this hot June morning her white dress, with its rose coloured under skirt, was befitting and befurbelowed beyond anything to be found in the Book of Fashion, of which she was an assiduous student. Whatever was exaggerated in that, became still more exaggerated when adopted by Miss Peabworth. In the life of her, Clara could not come down to breakfast without four or five drumsticks on her fingers, but then, as she herself would have said, what's the use of having a lot of jewellery if you don't take every opportunity of showing it off?

Mr Peabworth, when at home, lived in the pleasant suburb of Baywater. His house was a handsomely fitted one in a most fashionable square, but it was essential to Mr Peabworth's business that he should make a good appearance before the world, while it was so useful to all every one that a rich old gentleman and his unassisted wife occupied the best rooms in the house, and thereby helped materially to lessen the expenses of the establishment.

Mr Peabworth's offices were up in all fashionable count in one of the best streets of the City, the said offices consisting, of one large room divided by a glass and iron partition into two small ones. There were several other offices in the same building, a modern edifice which dated back to the period of William and Mary, and had evidently in its time been the home of some notable City magnate. Amongst other legends recorded on the beautiful old door-jambs might be read this one: 'MR ALGERNON PEABWORTH, General Agent, &c.'

Now, the phrase 'General Agent, &c.' is one capable of a somewhat wide application, as Mr Peabworth when he adopted it was probably quite aware. What Mr Peabworth's particular line of business might be, and if it was what secured the bulk of his income was derived, were things probably known to himself alone. It is quite certain that neither his wife nor daughter had any fixed idea on the subject. It was generally understood that he was more or less mixed up with the promotion and management of railway joint stock companies and speculative associations of greater or lesser extent—not unfrequently the latter, while those who were supposed to be best informed in such matters availed that he was merely a caterpillar and go between for certain big financiers, who did not always care to let their names go forth to the world until the golden day, with which they strove to tempt the public, should be successfully hatched, there being sometimes a risk that the eggs in question might turn out to be addled. Be that as it may, Miss Peabworth had hitherto contrived by hook or by crook, to keep her head above water, and the Baywater establishment showed as good a face to the world as most of its neighbours.

Miss Clara had been an inmate of her father's home about six months when we first made her acquaintance. Previously to that time, she had been living with some of her father's relatives in Devonshire.

It was essential to the due carrying out of Frank Frohisher's scheme that he and his well-found relatives should be brought into frequent, if not daily contact. There was only one mode by which this could be effected, and that was by

Our friend Richard no longer looked like the same man who, in acquaintance, we made in Boston. His ironical look had been shorn away till no more was left of them than would have commanded the critical approval of any military barber. For several days, after the operations Dick asserted that he felt quite light headed. The mathematical straight line down the middle was a source of much trouble to him every morning. His once ragged sandy moustache had not been much cut, but had been trimmed and waved and coaxed till it would not have done discredit to a captain of dragoons. His threadbare velvetene jacket, his baggy trousers, and his down-at-heel boots were no longer, that had never been. The dark faced suit which he now wore had been constructed by a West End tailor, while his patent shoes and snowy white stockings united the mind back to the pavements of Piccadilly and Bond Street. In the matter of collars, cuffs, and cuffs, Dick was elaborately got up, while it was a strange experience to him to know that there was no Lunder's account in arrears, and that he might indulge in clean linen every day, were he so minded. If he took

out of his pocket once a day the gold chrono- meter which Frank had made him a present of, he took it out forty times. Only two months ago he had rather despised a man who carried a watch. As for the splendid bracelet which he wore on the third finger of his left hand, all that can be said is, that when one has a moustache, one generally twists it, or twirls it, or strokes it, as the case may be, with the left hand.

Mr Dempsey, who had been a great dandy once on a time, would soon have persuaded the world that he had not yet forsaken all claim to the appellation. He was thin and tall, and remarkably upright for his years. It was whispered that he wore stays, but that was probably a calumny. His complexion was of that tint which is usually associated with too free an indulgence in old port. He wore a brown curly wig, and his moustache and imperial were dyed black. He wore his hat jauntily on one side, after the fashion of days gone by. This June morning he had on a long blue frock coat, a white waist, blue trousers, and patent boots with straps, not forgetting a more useful and a spring of moustache foam in his button hole. When he sat down, he sat down with deliberation, and when he got up, he got up with deliberation. Either his clothes fitted him too well, or he was slightly stiff in the joints.

Captain Downes Dyson was a little miscount looking, fair complexioned man, with a small fluffy moustache, weak eyes, a thin piping voice, and an eyelid which was a perpetual source of trouble to him. He was dressed quietly and like a gentleman.

Dick came to a stand in the middle of the lawn and drew forth his chronometer. 'Remember, ladies and gentlemen! he cried out with an air of authority, 'that the dig will be found in two hours from now. Vivat Regina!'

'What place are we going to visit to-day?' asked Dyson.

'The ruins of Lelf at Abbey,' answered Dick. 'Ruins again—always ruins,' muttered Mr Dempsey discontentedly. 'I can't see what there is to interest anybody in a heap of old stones.'

Miss Deane overheard the remark. 'A sad state of things, when one man has no respect for another, she whispered mischievously to Dick.

Dempsey and Dyson had brought their own papers and letters with them, and they now sat down at the same table with Peabworth, who was deep again in the *Times*. Chinn had moved away to a seat on the opposite side of the lawn, and there Elma joined her. Dick had found a garden-chair for himself somewhat in the background. Next he sat down, and leaning back, tilted his hat over his eyes, stuck his thumbs into the armbolts of his waistcoat, and began to mouth—went off into a brown study.

'Time seems of no value in the country,' remarked Mr Peabworth in a casual sort of way. 'Past ten o'clock, and breakfast only just over. A clear loss of two hours per diem.'

'You can easily make up for it by sitting up two hours later at night,' responded the little Captain, who was addicted to post-prandial billiards.

'For my part, I think breakfast a mistake altogether,' said Dempsey. 'Why not follow the

example of the great carnivores, and feed once in twenty-four hours?'

'First catching your food, and then killing it,' interposed Peabworth.

'And afterwards eating it uncooked,' piped Dyson. 'It would save something in coals and servant.'

'Another morning catastrophe—another hundred or so of widows and orphans thrown on the world,' remarked Peabworth a minute later. Dempsey was waiting with ill concealed impatience till he should have done with the *Times*. Certainly Peabworth was keeping it in an unconscionable time.

'Why don't those morning fellows insure their lives?' asked Dyson.

'As a director of one of the largest insurance companies, I echo the question. Why don't they insure their lives?' This from Dempsey.

'To subsidize it, any fund for the benefit of these widows and orphans is an encouragement of wilful improvidence,' resumed Peabworth. 'They won't get a penny of my money.'

'Not of mine,' assented Dempsey. 'Nor of mine,' echoed the Captain.

## GUARDING THE QUEEN

THE many political assassinations that have taken place of late years have thrown upon the police of all countries an immense amount of difficult and delicate work in guarding monarchs, princes, and ministers. In England we have become familiarised with the idea that our leading statesmen must be escorted by detectives wherever they go, and popular as the Queen is, we know that elaborate precautions are taken to protect her every time she appears in public.

Few, however, can be aware of how much anxiety, activity, trouble, and consequent expense are involved in that word 'protecting'. Looking only at the pecuniary side of the question, the sum which a mailman or fanatic inflicts upon a country when he attempts, even without success, to take the life of a ruler, is considerable. The services of detectives have to be paid for; and to do their work properly, these officials must not be stinted of money for telegrams, railway and cab fares, and casual expenses. Sometimes they have to assume disguises, and to pay heavily for secret information as to alleged criminal designs, and though this information is often worthless, the police cannot afford to disregard any item of intelligence bearing upon the safety of the great personages whom they have to guard. Thus, the contents of every letter sent, whether innocently or not, to Scotland Yard are carefully considered. The mischievous simpatons who concoct untruthful letters for fun, and the foolish busybodies who write to disclose 'suspicious circumstances' that have come under their notice, may all rest satisfied that they cause worry and waste of valuable time, if nothing worse. As the police have sometimes received warnings of great importance through unnamed sources bearing no guarantee of good faith, they make it a rule to investigate all facts not palpably absurd which are revealed to them, and doubtless by so doing they have often been enabled to prevent crime.

Many an intending criminal must have been balked in his schemes by the timely discovery that his movements were being watched.

To guard a royal residence—that is, to keep an eye on suspicious characters who may growl about it, or seek admittance—requires vigilance, but is easy work compared with the task of protecting the sovereign when she appears in public. Every time the Queen leaves one of her residences, even for an afternoon drive, the event is notified some hours beforehand to the bees by the equestrian on duty, who announces what itinerary Her Majesty will probably follow. At certain points all along the route, policemen have to be stationed, and detectives are placed at all the spots where the royal carriages are likely to stop. Round Balmoral and Osborne, the roads can be watched without difficulty, but not so round Windsor Castle and Buckingham Palace. Wherever crowds can congregate, the difficulties of the police are multiplied. A special superintendent is deputed on ordinary occasions to patrol the line of the royal progress, but when there is a state pregnant, this duty is performed by the Chief Commissioner in person. He has to see that not only the policemen in uniform, but the detectives—unmarked by the crowd and not whom they stand—are all at their post. A staid cock of party signals exists by which a detective can make his presence known to his chief, and receive short instructions from them, without creating the attention of bystanders.

The whole detective force of Scotland Yard, however, would be insufficient to keep proper surveillance over miles of circuit, as, for instance, when the Queen went to open Brompton Forest, so on all occasions as these hundreds of policemen 'off duty' are pressed into special service, and turn out in plain clothes. Then, again, there are men who, in consideration of having good places from which to view the procession, act as amateur detectives. Every detective and policeman has a few personal friends who will 'boldly undertake a duty of this kind, and very often women are among the number. Their instructions are invariably to keep their eyes and ears open, and not to cheat when the procession passes. In this, English detectives differ from those of foreign countries, who are frequently enjoined to assist the cheering among the crowds, but the authorities of Scotland Yard have discovered that a detective who is dealing with all his might becomes useless for purposes of espionage. It is precisely when the cheering is loudest that duty is most to be apprehended, for the noise and the swaying of a multitude excite the nerves of the lunatic or criminal who is bent on mischief, therefore the police who are watching the crowd in its moment of greatest enthusiasm should remain perfectly cool.

They have also to protect the sovereign against others besides the rabble disposed, for there are always people who want to thrust petitions or bouquets into the Queen's carriage, or to shake hands with Her Majesty. Happily, these eccentric individuals generally betray their purpose by their restlessness. The man with a petition keeps feeling his pocket, to assure himself that the precious thing is safe, and as the royal carriage approaches, he half-chokes out the paper, but at this time a detective has observed

his movements, and a strong hand laid suddenly upon his arm paralyzes him at the opportune moment.

It is often lucky for would-be petitioners that they should be pulled back before they can accomplish their purpose, for if that purpose were unaccomplished by a loyal man, they might expose themselves to some very rough handling. The Queen is indeed very well 'nursed' by the affection of her subjects, and generally speaking, she has rather to fear annoyances from silly people than criminal attempts from vicious ones. This shows what terribly difficult work the police of some foreign countries must have to perform in guarding sovereigns who are unpopular. Occasionally, the English police have a taste of this work, when some of these unpopular potentates visit this country and have to be guarded against subjects of their own living here in exile. When Napoleon III visited the land in 1873, the government of the day suffered a great deal of anxiety lest harm should befall him, and the alarms were renewed in 1874, when the late Czar Alexander came to London. On both of these occasions, many were put out like water, and a proper protection of the illustrious visitors and the police did their work so well, that although there was serious reason for believing that malevolent attempts were being made, both Emperor and Czar visited the country without having heard so much as a rumour. The police, however, may be pardoned for having felt the most pleasurable relief when the visit of these much-travelled monarchs came to an end. When the Chief Commissioner, Sir Richard Mayne, received the telegram announcing that Napoleon III had safely landed in France, he remarked with quiet satisfaction, 'Now I shall be able to get a good night's rest.'

Many of the difficulties of the police in guarding royal personages come from these illustrious persons themselves. Princes who are bays do not like to have their feet kept logged in private life, and will sometimes grow impatient and angry when they find out that they have been watched for their own good. They have to be watched, nevertheless, whether they like it or not. It would never do for a royal Prince to be kidnaped and detained as a hostage by political or other desperadoes, and so care is taken that wherever a royal Prince may go, he shall always have his inevitable escort of police. The Prince of Wales was guarded nearly as vigilantly as the Queen. If he travels by rail, surveillance is kept by the police all down the line, if he Royal Highness hunts, rides, drives, or takes a stroll on foot through any part of the West End, a detective is sure to be close at hand. So it is with other members of the royal family in the quietest times, and unknown to the supervision must be, it has to be submitted to with good reason because of its absolute necessity. The police, however, are well served at times by these foreign Princes who cannot visit our own royal family, and who delight in shipping out of palace for rambles through the streets without giving any notice of their intentions. Some detective or other is always held responsible by his chief, and severely reprimanded when such a thing happens, for the police force on guard at the palace is supposed to be

in a condition to provide for all contingencies of the sort.

It will be seen from all this that the office of court detective is by no means a menial one, and one may add that it is of all posts that in which faithful, zealous, efficient service obtains the best honour and reward. Not that royal persons are ungrateful to those who guard them properly, but because the men who guard but not actually those who make the law for them. It is the duty of a court detective not only to shield Princes from danger, but to counsel them from them, so far as possible, that they have been in danger. Thus a man whose vigilance and diligence may over and over again have saved Princes from annoyance or hurt, will often be less appreciated than the more demonstrative men who, perhaps once in his life, has had the good luck to arrest the arm of an assassin after—not before—the deed was done.

## HOW WE FORMED OUR VILLAGI LIBRARY

THE small Scottish fishing village which we call meanwhile call Dalbin, is situated miles from the nearest railway station. The population within a radius of two miles from the village is only seven hundred souls. To try to establish a public circulating library in such a place might seem Quixotic, but a library has been established and more than this, successful. For the benefit of those situated in country districts, and too far from any public library to benefit by it, we propose to tell how the Dalbin public library was established and is conducted.

In the autumn of 1878, a few young men of the place met and talked of what they were to do during the coming winter. Both the Temperance Society and the Debating Club had become dormant and there was no hope of reviving them. Even if they were revived, they would form an attraction for but a few people, and for only one night in the week. These young men had heard much of the good derived from libraries in other places, and they accordingly agreed that the best thing they could do was to establish one in Dalbin. But where were the necessary funds to come from? It was hopeless to think that the Free Libraries' Act would be adopted in the parish. In the first place, therefore, they put bills intimating that a public meeting of interested would be held in the schoolroom, to consider how a public library could best be established. On the night appointed, twelve young men met, agreed that a library was necessary, appointed a Library Committee and Secretary, and gave their own subscriptions, amounting to three pounds. Four of the Committee were appointed to collect subscriptions from the inhabitants of the district, and in a month they returned with eight pounds as the result of their effort. The Secretary wrote to several Dalbin young men who were prospering in larger towns elsewhere, and by return of post received three pounds.

■ We were now the beginning of December, and in order to raise an additional sum of money, they resolved to hold a concert on New Year's Eve. The night of the concert, however, chanced to be

a stormy one, and the net sum amounted to only two pounds.

The treasurer had now in his hands a little over sixteen pounds—a small sum to begin a public library with, but it was resolved to make the best of it. And here a new and unexpected difficulty arose. ■ We all along thought that as there were two small unused classrooms in connection with the Dalbin Public School, there would be no difficulty in obtaining the use of one of these for a library. But when this was asked for, the School board said that they had no power to grant any of the schoolrooms for such a purpose, and as no other conveniently situated room could be found in Dalbin, the Committee were for a time at a loss. In order to get out of the difficulty, it was resolved that the members of the Library Committee should call on the School board members as well as on the most influential ratepayers, and explain that the library would not intrude on school work or space. The consequence was that the formal resolution of the School board was rescinded, and the school offered to the Committee on the following conditions: (1) That the teacher had no objections, and would take charge of the library; (2) that the library trustees should be responsible for any damage done to the school buildings; and (3) that the library trustees should insure the building against fire.

The teacher having no objections, not only acquiesced in what the Board had done, but also willingly took charge of the library, and has since continued to be librarian and treasurer. The other conditions were also complied with by the Committee.

Such were the delays arising from these and other causes, that it was nearly mid-November before all the conditions were fulfilled.

The next step was to buy books. Each of the members subscribed such books as he thought would be popular and the list was then sent to Edinburgh, a friend then being asked to try and purchase them second-hand, and so well was the money invested, that for sixteen pounds they received a parcel containing no fewer than one hundred and seven well bound standard volumes, which were duly stamped and numbered.

At the beginning of the winter of 1879-80, it was resolved that the library should be opened to the public forthwith. The regulations were few and simple, and copies of them, with a list of the subscribers, were ordered to be hung on the wall. These rules are—(1) The library is open on Tuesday evenings from eight to nine o'clock; (2) the subscription fee is sixpence per quarter, payable in advance; (3) no book can be kept more than a month by any one reader; and (4) any one damaging or failing to return a book is responsible for the same.

It was expected that about ten volumes would be taken out nightly, but all went pleasantly surprised to find that on the first night no fewer than twenty-six came for books, and on the following Tuesday no fewer than thirty-four came. It was evident that if such a demand continued, there would soon be few books, if any, for the subscribers to choose from. The Committee therefore set themselves again to work to supply the demand thus unexpectedly made on them. To begin with they redoubled their own subscriptions, and

early in March, held a concert, which realised five pounds. The member of parliament for the county gave five pounds, the gentleman who had the shooting of Dublin, five pounds, and the proprietor of Dublin, four guineas. In this way, in less than three months, one hundred and ninety new volumes were added. 'Nothing succeeds like success,' and those who at first looked askance at the movement, now subscribed, and became readers.

In due time the annual Report was issued, which showed that for the year 1879-80 the income amounted to twenty-seven pounds, that two hundred and seventy new volumes had been added, that there were as many as sixty-four subscribers, and that eight hundred and fifteen volumes, or sixteen per week, had been taken out. This in Dublin meant a great deal of reading, as there is seldom more than one who subscribes out of a family; and doubtless each member who wishes has the reading of the book before it is returned.

Another annual Report has now been issued, which shows that the income for the second year had been nineteen pounds, that two hundred and four new volumes were added, that the number of readers was fifty, and the number of volumes taken out eight hundred and eleven. The fall-off in 'books taken out' is attributable to the fact, that there was a well attended singing class carried on for four nights per week during the winter. The deficiency of income was compensated, as those interested who give a donation were usually expected to do so again.

Two new experiments have been tried during the year, namely, the lending of books to the school children at one penny per quarter, and the addition of a few of the monthly magazines. The school children get books out on the Friday afternoon, and during one year they have thus taken out three hundred and thirteen volumes, of which they were able to tell something when they returned them.

Now that the library has had a fair start, it is calculated that there will be a surplus of two pounds per annum, independently of any donations which may be received from friends. This sum is spent in purchasing books, so that the library is continually though slowly growing. Moreover, so strong has the desire of reading become in a few of those who were the most sceptical at first, that, seeing they could not gratify themselves at Dublin they had climbed together, and now get monthly parcels of books from leading libraries in the larger towns.

## STRANGE, BUT TRUE

In a very entertaining work entitled *Random Shots by a Rifleman*, written by the late Captain Kincaid of the old 96th Regiment—then the Rifle Brigade—there is a story told which of my first readers appeared to possess many of the qualities contained in those amusing actions narrated by Baron Munchausen. Later, however, on becoming better acquainted with the author, I felt convinced he had been detailing facts, and of this I received unexpected proof in after life. I regret I have not Captain

Kincaid's work at hand, but, to the best of my recollection, the author's story ran somewhat as follows:

In one of the many actions in which our troops were engaged under Wellington during the Peninsular War, an officer had one of the large muscles of his neck which support the head severed by a Frenchman's bullet. The wound soon healed, and the injured officer suffered from it little more than beyond that of having to carry his head rather drooping, the only ailment. At the battle of Waterloo this officer was also present, and was again wounded in the neck by a bullet, which, strange to say, cut through the opposite muscle of his neck supporting his head, and thus the second rectified the mischief done by the first bullet, and, as a matter of fact, the officer's head was set straight upon his shoulders. When writing the above story, Captain Kincaid was apparently fully aware of its improbable nature, and in justice to himself, adds 'I would not have dared to repeat this story, were not the wounded officer alive at the time of my writing, and ready to corroborate the same.' Captain Kincaid then proceeds to give the officer's name, together with that of his residence, both of which I must prevent forget, but which are to be found in *Random Shots*.

I may here say that I was not in the habit of repeating the above story, for although I felt perfect faith in Captain Kincaid's veracity, I could not but feel there might be those who would doubt my own. It happened, however, in the year 1847 that I, when quartered at Blackfield, attended a company dinner, during the course of which the conversation turned upon the subject of remarkable wounds, and on this occasion I was tempted to add Captain Kincaid's story to others already startling. As I had expected, I noticed that the story was received with much interest, and the further development of which position alone prevented. I could not follow Captain Kincaid's example, and give the name of the wounded officer, nor the place of his residence, I had forgotten both, and I felt myself equally sinking in the esteem of the company, when, to my surprise and delight, one of the company officers present—a pathman almost a perfect stranger to me, but well known to the rest of the company—remarked in a distinct voice across the table 'You have told that story very well, sir. There is, however, one fact of importance you have omitted to mention, namely, that in consequence of both the muscles of the neck having been injured, the head of the pathman, although straight, has very much sunk on to his shoulders. He is a friend of mine, and well known to others in this neighbourhood, and at present resides within ten miles of this town.' The company officer then repeated the name and residence of the wounded officer, thus corroborating Captain Kincaid.

The second story I wish to relate is as follows.

On first joining my regiment in the Bombay Presidency, I was, like most young men, very desirous of an opportunity of hunting large game, and in order that I might not behave myself like a thorough 'griff' on my first interview with the directors of the Indian jungles, I proceeded to study all works treating on the subject of shooting which came in my way. Amongst others, I became much interested in a book written by Major Forbes, then of the 78th Highlanders, and which was styled *Ten Years' Residence in Ceylon*. At the time to which I refer, my regiment was brigaded with the Bombay Buffs, and I was not unfrequently brought into contact with Major Forbes, both at the mess table and on duty. I soon learned to esteem this officer both as an excellent soldier and as a fine specimen of the British gentleman, one who under no circumstances would wilfully utter or propagate an untruth. In the book above alluded to, Major Forbes gives a pleasantly written description of many parts of the island of Ceylon, interlarded occasionally with interesting anecdotes connected with the pursuit of large game. Amongst other stories, the author details one which, had I not been personally acquainted with Major Forbes, I should in all probability have soon forgotten, or remembered only as one of those fictions so frequently narrated in order to impart a romance to an otherwise dull book.

The story is given by Major Forbes thus, to the best of my recollection, much as follows: An officer belonging to one of the regiments then stationed in Ceylon, had with him, when on an excursion hunting wild elephants, an old fashioned single barreled gun of the pattern in vogue before the introduction of the patent breech-loader. This old fashioned weapon, there was a breach block, but the rest part of the barrel was secured by a tongue of iron, which overlapped, and which was worked in to the upper part of the stock. On the present occasion, this old fashioned weapon, on being fired, burst, and a large portion of the iron which formed the breech, together with the tongue and screw which connected the breech to the stock, was forcibly driven into his head. Major Forbes adds that this officer, fully wounded as he was, survived ten years, and lived with this lump of iron in his head without suffering any serious mental violence, and that he afterwards died from the effects of fever. Thus far from Major Forbes's book.

In the year 1849, it happened that in company with a brother officer, and under the guidance of one of the senior medical officers at Fort Pitt, I was inspecting the Museum connected with the Hospital. Suddenly, my eyes lighted on an object of which I had not been thinking for many years, but which I at once recognized as the breech of the old gun so accurately described by the author of *Ten Years' Residence in Ceylon*. In order that there might be no mistake, I inquired of the doctor whether he could tell me what the object was, and further whether he knew anything of the history connected with it. 'That,' said he, 'is the model of the breech of a gun, the original of which was cut out from the head of a deceased officer in Ceylon, after it had been imbedded in it during ten years of his life. Here was corroborated number one of Major Forbes's story.

A few years later, I happened to be strolling on the parade ground at Lahore, and in company with the surgeon of the 86th Regiment, I was conversing on the subject of the wonderful recovery made from gunshot and other wounds. Remembering that my companion had served for a considerable time in Ceylon, I inquired whether he had ever heard of the extraordinary case mentioned by Major Forbes, of an officer living for ten years with the breech of a gun lodged in his head. To my astonishment, he replied, 'Not only have I heard of the case, but I was, moreover, at the time very much concerned with it. It happened to be,' he continued, 'in the immediate neighbourhood when the occurrence took place, and the wounded man was brought to me first for medical advice and treatment. I at once recommended that the block of iron should be cut out, but as at that time I was a young assistant surgeon, the officer hesitated to accept my advice, and requested he might be taken to the nearest station, there to see and consult with the surgeon of his own regiment. This surgeon was rather behind the age in the same of opinions, and pronounced it as his opinion that there was less danger to be apprehended in permitting the iron to remain in the wounded man's head than in the making any attempt to extract it.' My friend the surgeon of the 86th went on to say, 'I remained in Ceylon for many years after this incident, and I may say without the result. The wounded officer continued to enjoy very fair health, and to perform duty with his regiment for upwards of ten years.'

His death occurred in the following manner. An officer belonging to the same regiment was about to proceed to England on sick leave, in that suffering from a disease of the lungs. On the eve of the day of his departure, this officer found himself at a late hour in the mess-table in company with the man who had survived for so many years the accident occasioned by the breech of his gun. These two were the only occupants of the mess-table, and had, therefore, little to do, unlamented more wine than was good for them. Somehow, in drinking parting bumper, they lapsed from the maudlin into the quack-speech state, and began the one to tell the other with his minutiae. At last he of the weak lungs being aided by some remark from his companion regarding the delicacy of his chest, backed himself to do up the ladder and the longer of the two. This challenge was accepted. Six rounds had, however, not long continued, when, with a loud yelp to his temples, the man with the wound in his head rose up from the table and staggered off into his quarters. That night he became very ill, and in three days the man who had for the last fifteen years of his life carried a lump of iron in his head almost with impunity, succumbed to an attack of brain fever. After death, his head was opened, and it was then discovered that this lump of iron had been slowly but surely working its way towards the brain, from which it had hitherto only been separated by a thin skin or membrane. In his many excursions in company in room with his weak-chested companion on the night mentioned, he had ruptured this membrane. The iron coming into contact and pressure, upon the brain, had produced brain-

fever, from which the unfortunate man died within three days.

Here my friend concluded his narrative, and completed a full corroboration of Major Forbes's story.

### THE HUMOURS OF EXAMINATIONS

As a rule, examinations are not regarded by the outside world as occasions in which a display of humour may be expected. But if exceptions prove the rule, then my examinations claim to afford a very rich fund of ludicrous incidents. There are naturally varied circumstances in examinations which call forth the wit of the candidate. The humour varies, in fact, with the particular person who is being examined, and what is the topic of conversation between examiner and candidate. There is to be distinguished a medical as well as a legal humour, and conspicuous amongst the occasions which afford opportunity for the display of the ludicrous, are those examinations which, disguised by the name of 'general knowledge' and, afford a very wide and rich field for the ingenuity of candidates.

A thought may suggest itself to some who reflect upon the subject of examination humour, that of all circumstances, the position of a candidate at an examination table is the least likely situation to evoke a witty or humorous remark. The talking of the funny to find an answer to an oral question, the knowledge that the examiner is waiting with a list of questions for one's reply, and the disposal of a subject which at first the candidate may take to the occasion, form a series of circumstances, out of which

Agos? Answer 'When the new pennies became current coin in the realm.'—What are the 'Letters of Junius'? Answer 'Letters written in the month of June.'—What is the Age of Reason? Answer 'The time that has elapsed since the person of that name was born.'

The replies given to questions of a scientific nature are often of a remarkably curious, not to say extraordinary kind, and appear frequently to result from a want of appreciation of the exact meaning of the teaching. We know, for example, of a student in a popular class of physiology who on being asked to describe the bones of the arm, stated in the course of his reply that the bone of the upper arm (named *humerus* in anatomy) 'was called the *humerus*, and that he received its name because it was known as the "funny bone".' The Latin name of the bone had evidently become confused in the student's mind with the popular name given to the elbow, the nerve of which on being violently struck, etc., against a piece of furniture, gives rise to the well known sensation of 'pins and needles' in the arm and hand. Another answer given in an anatomy class is worth recording. The teacher had described the *scapula* or scapula bone, the scientific name of course being simply the Latin equivalent for the scapula. No such philosophical idea had troubled at least the student who replied to a question concerning the scapula, 'That it was called the *scapula* because St Paul had written upon it, to the city of that name.' Still more ludicrous was the confusion of ideas which he got a student who was questioned regarding the nature of the organ known as the pancreas or pancreas, which, as most readers know, is an organ situated near the stomach, and supplying a fluid of great use to the digestion of food. The reply of this latter student was as

data makes up his mind to say or write something, and that something, as often we meet, is an unimportant moment of inspiration, a joke.

One of the frequent causes of humour at an examination is of course the ignorance of candidates. A person was once asked to answer the question, 'Who was Frau?' His reply was highly characteristic. 'Easi,' said he, 'was a man who wrote full, and who sold the copyright to a publisher for a bottle of potash.' The confusion of 'Easi' and 'Easi,' of 'copyright' and 'burning,' of 'potash' and 'potash,' is an example of humour of by no means an unusual class. Another student was asked to give some account of Wolsey. His reply was unique. 'Wolsey was a famous General who fought in the Crimean War, and who, after being disappointed several times, said to Churchill, "Ah, if I had only served you as you have served me, I would not have been deserted in my old age!"'

In an examination designed to test the general knowledge of young ladies about to enter the ranks of professional student life, a series of questions was put as tests of the reading of the candidates. The following were some of the replies obtained from the aspiring youths. 'What was the Stu Chamber?' Answer 'An astronomer's room.'—'What was meant by the "Year of Jubilee"?' Answer 'Leap year.'—'What was the "Broom

ludicrous than the confusion of ideas as to the relation between St Paul's Basilica in St Paul and an organ of the human body, can hardly be overestimated.

It is related of a rough and ready examiner in no time that on one occasion having failed to elicit satisfactory replies from a student regarding the muscular arrangements of the arm and hand, he somewhat brusquely said 'Ah! perhaps, sir, you could tell me the name of the muscles I would put in motion were I to kick you.'—'Certainly, sir,' replied the candidate 'you would put in motion the flexors and extensors of my arm, for I should use them to kick you down.' History is silent, and perhaps worth so concerning the fate of this particular student. The story is told of a witty French student, who once upon a time, appeared before an examining Board to undergo an examination in the history of philosophy. The subject of examination was philosophy, and the examiner had selected that deathly philosophy as the subject of his question. 'Pray, sir, and he to the candidate, what is a philosophical doctrine of philosophy?' After a pause, for a moment, the student replied with promptitude 'Half an ounce, sir!' Horrified at the extreme ignorance of the candidate, the examiner exclaimed 'Half an ounce! Why, sir, you must be dreaming! That is an amount which would poison a community, sir, not to speak of an

continued the examiner, intent on ascertaining the candidate's real knowledge, 'suppose a man did swallow half an ounce of prussic acid, what treatment would you prescribe?'—'I'd ride home for a stomach pump,' replied the unshakable student.—'Are you aware, sir,' retorted the examiner, 'that prussic acid is a poison which acts with great rapidity?'—'Well, yes,' replied the student.—'Then, sir, suppose you did such a foolish thing as you have just stated,' said the examiner, 'you ride home for your stomach pump, and on returning you find your patient dead. What would you, or what could you do then?' asked the examiner in triumph, thinking he had driven his victim into a corner whence there was no escape.—'What would I do?' reiterated the student.—'Do?—why, I'd hold a post mortem!' For once in his life, that examiner must have felt that dense ignorance united to a power of repartee was more than a match for him.

Incidents of a ludicrous nature frequently occur in the examination of patients both by doctors and by students. A Professor on one occasion was lecturing to his class on the means of diagnosing disease by the external appearance, face, and other details of the patient. Expressing his belief that a patient before the class afforded an example of the practice in question, the Professor said to the individual, 'Ah! you are troubled with gout?'—'No, sir,' said the man, 'I've never had any such complaint.'—'But,' said the Professor, 'your father must have had gout.'—'No, sir,' was the reply; 'nor my mother either.'—'Ah, very strange,' said the Professor to his class, 'I'm still convinced that this man is a gouty subject. I see that his front teeth show all the characters which we are accustomed to note in gout.'—'Front teeth?' ejaculated the patient.—'Yes,' retorted the Professor, 'I'm convinced my diagnosis is correct. You have gout, sir.'—'Will, that breaks everything,' replied the man, 'it's the first time, sir, I've ever heard of false teeth having the gout! I've had this set for the last ten years.' The effect of this silly on the part of the patient, upon the inquisitorial Professor and his students, may be better imagined than described.

Occasionally within the precincts of colleges and universities, a rich vein of humour may be struck in a very unexpected fashion. On one occasion a Professor, noticing that certain members of his class were inattentive during the lecture, suddenly arrested his flow of oratory, and addressing one of the students, said, 'Pray, Mr Johnston, what is your opinion of the position of the animals just described in the created scale?'—'Mr Johnston' was forced to say that 'really he had no views whatever on the subject.'—Whereupon, the Professor turning to a second inattentive student—who had evidently not caught 'Mr Johnston's' reply or its purport—said, 'Mr Smith, what is your opinion of the position of these animals in the classified series?'—'O sir,' replied the innocent Smith, 'my opinions exactly coincide with those just expressed so lucidly and clearly by Mr Johnston.'

There are examiners, and examiners, of course, some stern, others mild and encouraging, some

who try to discover what a student knows, and others whose aim appears to be rather that of elucidating the ignorance of the candidates who appear before them. But to the end of time, there will be humour mixed with the grave concerns of testing knowledge, which is, for both sides, a hard enough task. The student who, when asked by a stern examiner what he would recommend in order to produce copious perspiration in a patient, replied, 'I'd make him try to pass an examination before you, sir,' had a keen sense of humour, which it is to be hoped the examiner appreciated. His answer was in keeping with the question which has been argued by us and by others, whether the whole subject of examinations as at present conducted, should not be thoroughly overhauled and revised.

# WATCHED A GHOST

SONG SUGGESTED BY SOME FOREIGN JIVIES PICKED UP ON THE EAST COAST OF SCOTLAND, AFTER A SCOTCH

To enter there is a storm at sea  
I hear the breakers roar  
There comes among the gray sea  
The shadow of the shore,  
And pale dawn within my soul  
For thus upon the deep  
Kind Saviour Christ do Thou control  
The waves, and bid them sleep!

A week ago one walked alone  
Across yon sandy beach,  
As I close beside a rocky mass,  
Out of the billows reach  
He found washed up and was in and shells,  
These letters stained and worn—  
Had ye each of some heart that dwells  
All lonely and forlorn

Some old-eyed woman dwells remote  
From the tempest near me  
And months ago those letters wrote—  
As a huge heart had to  
Her water husband far away  
Bore in his faithful breast  
These heart of her which speak to day  
Of home and love, and rest

She tells him of her lonely life  
And how she prays that he  
May not forget his loving wife  
While on the stormy sea  
And how she asks that God would keep  
His love from all ill,  
As I can't, make wish to do that,  
And sinners waken still

Ah! a sob-sore on our shore,  
By stormy billows torn,  
Went down amid the tempest's roar,  
And every soul was lost!  
So still, a woman, hoarse-eyed,  
May wait in hope at home  
For him whose neither wind nor tide  
Shall help to come he from

Ah me! the wind blows loud to night  
Christ ever poor souls at sea!  
Bare bravely every brow in light  
When war ships may be

## A ROLAND FOR AN OLIVER

THIS term is so generally understood, that any comment upon it is almost superfluous. It is, however, no slang phrase, but one of the oldest of proverbial expressions, dating apparently as far back as the latter end of the eighth century. We are told that the Emperor Charlemagne, in his expedition against the Saracens in 778, was accompanied by two pages, named Roland and Oliver, who were so excellent and so equally matched, that the equality became proverbial—'I'll give you a Roland for your Oliver,' being the same as the vulgar saying, 'Tit for tat,' that is 'I'll give you the same [generally in a retaliatory sense] as you give me,' or the more classical one of *Quid pro quo*, to be even with one. Its proper adaptation, however, as understood at the present day, will be much better explained by a few humorous illustrations.

A very clever reply to a somewhat satirical remark was that given to Louis XV by Cardinal Richelieu, who was a nobleman as well as a priest. A celebrated Archbishop of Paris, Harcourt de Beaumont de Paris, was appointed preceptor to His Majesty. One day he preached a notable sermon before the Court of France, which touched principally upon the duties of the nobility. 'Ah!' said the king to Richelieu, 'the preacher has thrown a vast quantity of stones into your garden to day.'—'Yes, sire,' answered the Cardinal, 'and a few have fallen into the royal park.' A courtly amount of etiquette of expression is observable in this answer, with which we may presume that even royalty itself could in nowise be offended.

Equally as good is the following, in which we shall carefully note by the way that pearls have different effects on different minds. The Emperor Alexander of Russia, during the occupation of Paris, was present at the anniversary of one of the hospitals. Plates for contributions were passed round, and they were borne by some of the patrons' wives and daughters. The plate presented to the Emperor was held by an

extremely pretty girl. As he liberally gave his pound down, he whispered 'Mademoiselle, this is for your beautiful bright eyes.' The charming little damsel politely curtseyed, and immediately presented the plate again. 'What!' said the Emperor in amusement, 'more!'—'Yes, sire, said she 'I now want something for the poor.'

It is related of Mr Hamilton of Dykebar, a well known farmer, that, visiting the palace of Hamilton on a certain day, and brought into conversation with the late Duke, His Grace—always so pleasant and courteous in his demeanour, and pleased with the humour of the old farmer—said in a jocular way 'Pray, Mr Hamilton, where in our ancestral tree am I to look for your family?'—'Oh!' replied the old man, drawing a long breath, as if astonished—'what ever think of looking for the root among the branches?' The Duke laughed heartily at this, and added 'Quite true, quite true, it would indeed be folly to do so.'

Speaking of farmers, the following anecdote, as related by a Sussex gentleman, may claim especial notice, being as pointedly connected with our present subject. It exhibits also the peculiar disadvantages an agriculturist has to contend against in farming near a populous town.

'One day,' said this gentleman, 'before harvest, I met a fashionably dressed person with a large handful of ears of wheat, taken from my field. I saluted him respectfully, and expressed my admiration of the beauty of the wheat. "Yes," said he, "it is truly a fine sample, and does the farmer great credit who grew it." I acknowledged the compliment, and asked him from which of my fields he took it. After he had pointed it out, he assured me he always liked to take a good sample home, as it interested the ladies. Upon this, noticing with a misgiving the style of his coat, I asked him to allow me to look at the skirt. He readily did so, and I quietly took out my pen-knife and cut a large piece from the tail. The gentleman frowned and swore, but I told him I always took samples of cloth, as I found they greatly interested my wife. I added, that he had

no more right to take my wheat than I to take his cock, and that I wished the public to bear this truth in mind."

This was experience bought with a vengeance. It is more often than not a very dear school, but some people will learn in no other, and wisely even in this.

On one occasion, an English gentleman, who possessed a large wit, was at a brilliant reception at the duke of Vienna, where a distinguished lady of that city frequently annoyed him with her mediate circle of friends by saying smart and rather malicious things, evidently for the purpose of annoyance. "By the way," inquired her fair interlocutor, "how do your countrymen speak French so very imperfectly? We Austrians use it with the same fluency as if it were our native tongue." "Alas," replied the Englishman in the blindest manner, "I really cannot say, unless it be that the French may have not been twice in our capital to teach it, as they have been in yours."

One of the most distinguished incidents of Zimmerman's life was the summons which he received to attend Frederick the Great in his last illness in 1768. One day the king said to this eminent physician: "You have, I perceive, helped many a man into another world? Any ordinary person would do nothing but be scared by so soon at us in inquiry, and it was, in fact, a somewhat bitter pill for the Doctor, but the dose he gave the king in return was a judicious mixture of laudanum and history. "Not so many to your Majesty, nor with so much honour to myself."

As all slaves of individuality, from the highest to the lowest, are liable to times to meet with Roland for an Oliver, we must not even exempt those sturdy men of the world termed lawyers. A certain man was called upon to stand as a witness. "Well, sir," said the lawyer, "do you know the plaintiff and defendant?" After a moment's hesitation, Jack declared his inability to comprehend the meaning of these words. "What do I know the meaning of plaintiff and defendant?" continued the lawyer, "inquirer." "An intelligent fellow you must be to come here as a witness!" On you tell me where on board the vessel it was that that man struck the other one?" "Certainly I can," replied the sailor, "it was about the luncheon." "And pray," asked the lawyer, "what do you mean by that?" "Well, that's good," responded the witness, "you must be a pretty fellow to come here as a lawyer and don't know what about the luncheon means!"

At another time, a lawyer, in cross-examining a witness, asked him, among other questions, where he was on a particular day, to which he replied that he had been in the company of two friends. "Friends?" exclaimed his interrogator, "two friends, I suppose, you mean?" "They may be so," replied the witness dryly, "for they are both lawyers."

A good story is told of a certain Bishop, who, from information received, felt at his paramount duty to remonstrate with one of his clergy for hunting, and so the renowned Nuncio was expostulated with by his clerk. "Well, your lordship," was the reply, "I think you will agree with me that not a little generalship is required in the management and marshalling of

our pleasures, and I really don't see that it is any worse than going to a ball." "I conclude," rejoined his lordship, "that you allude to having my name among the list at the Duchess of M—'s ball, but I assure you I was not in the same room with the duchess during any part of the evening." "Thank my lord," replied my clerk, "was the calm rejoinder, 'I am never in the same field with the hounds.'" After such mutual explanations on both sides, we must not be surprised to hear that the conversation suddenly dropped.

By "tuning the table," as it were, upon the canon, a common soldier of the Russian army proved himself equal to the occasion, and speedy promotion was the fortunate result. It appears that Suvoroff, the well-known Russian general, used frequently to ask his young officers and soldiers the most abstruse questions, considering it a proof of sagacity on their part if they gave a prompt reply, and being above all things, "I don't know" was an answer. One day went up to a sentry, and as the man presented arms, Suvoroff said: "Tell me how many buttons there are on the uniform of fifty thousand men?" "I can't say," replied the soldier, very naturally, upon which the marshal, according to his custom, began to abuse him for an ignorant and stupid man for his stupidity. The sentry, however, knowing Suvoroff's character, took it up, and said: "Well, sir, perhaps it's not every question your Excellency could answer yourself, for instance, there are my two old Russian grooms—would you please to tell me their names?"—The man's quickness aimed for his apparent impudence in the eyes of the general, and the clerk was elevated from the ranks the following morning, his promotion being the turning point to an ultimately distinguished career.

It need scarcely be said, however, that the same good fortune does not always attend every individual's question raised by a superior person, should he encounter the under majority. It is well known, for instance, that Frederick, king of Prussia, conqueror as he was, sustained a severe defeat at Mollath in the war of 1745. Some time after, at a review, he joyously asked a soldier who had got a deep cut across his face: "My good fellow, at what particular moment did you get that ugly looking scratch?" "I got it," answered the man, "at Mollath, where your Majesty paid the Rhinegrave." It is extremely doubtful if any reward or promotion followed on this occasion, but if so, history has unfortunately failed to make any record of the circumstance.

Again, there are people who mistake importance for wit, and often get rather more than one Roland for their Oliver. One of these persons, a supposed politician, being conversant enjoying the pleasure of the table, said: "Ho, sir, I see philosophy in mankind in the greatest delicacies and good cheer." "Why not?" replied the other. "Do you really entertain such an idea as to imagine Providence intended all good things for the foolish and ignorant?"

In thorough conformity with our subject, numberless instances might be quoted in which the humour is somewhat of a 'broader' kind. A young man in America during an electioneering campaign, suddenly shouted out: "Hurrah for Jackson!" at which a Van Buren man exclaimed,

angrily 'Hurrah for a Jackson!'—'All right, old man,' said the youth, 'we won't quarrel over such trifles, you can hurrah for your favourite candidate, and I'll do the same for mine.'

Examples culled from history and records are occasionally open to serious doubts, and it would be extremely hazardous at times to give a guarantee for their perfect truth. Apart, however, from these grave misgivings, they serve their purpose in an admirable manner in illustrating such subjects as those we have in hand, as the following concluding anecdote will amply testify.

Henry Carey, a cousin to Queen Elizabeth, after having enjoyed Her Majesty's favour for several years, lost it in this manner. As he was walking in the garden of the palace under the queen's window, the royal lady, in a jocular manner, 'What does a man think when he is thinking of nothing?' The answer was a very brief one. 'Up in a woman's room,' he replied.—'Will do so, cousin,' said Elizabeth, 'but I will not.' Some time after, he solicited the honour of a peerage, and remained the queen that she had promised it to him. 'True, said Her Majesty, 'but that was a woman's promise.'

## ONE FALSE, BOTH FAIR,

OR, A HARD NOSE

### CHAPTER IV.—I AM THE MARCHIONESS

THE lawyer was right. The musical bells and clash of hoofs and wheels heralded the anticipated arrival. Then after a brief delay, the door was opened, and the room of the chamberlain announced 'The Marchioness, my lady' and Miss Carew.'

Lady Barbara stepped forward with a stately tenderness of manner that became her well, to greet her widowed niece, as the two sisters in their mourning, who appeared in the doorway. Mr Pontifex stood bowing and smiling, in the background as the two, whose figures approached. She who came first, threw her arm round Lady Barbara's neck, exclaiming, in a voice half stifled by emotion, 'I little thought when I left home—it seems but yesterday—that I should return here alone, and—ah!—Yes, dear aunt, it is the coming back of old Cécile! I say that brings my bereavement with fresh sorrow—the pain of it—back to me. I feel not now as I did when—when!—And she broke down, crying.

An outburst of passionate grief, even in our placid epoch, is contagious. Mr Pontifex took snuff more demonstratively than was usual with him. It was in a very softened tone, and in a quasi-maternal manner, that Lady Barbara said, 'Be comforted, my child—my poor Cécile, you are at home again now, dear, and with friends. Here is Mr Pontifex, whom you may remember, perhaps, the chamberlain of Castel Vaux, as she recollected the presence of the family lawyer.—'Yes, yes, you are back with us again, in England, and at home, and then, too, you have your sister, Miss Carew.' And Lady Barbara

held out her hand, with a smile that was meant to be cordial, to the pale, fair girl who stood, as if hemstayed, a pace behind, and who now came forward, and with the colour fluttering in her cheek, said, in a faltering voice 'You mistake me, aunt—Lady Barbara? Do you not know me, then? I am the Marchioness.'

The other sister, still sobbing, started, and turning towards the last speaker, said, in a tone of bewilderment 'Why, Cora! O sister—my poor Cora—what can all this mean?'

Lady Barbara herself drew back, astonishment on her eyes, displeasure in her voice 'Miss Carew?' she said grimly.

The girl thus addressed grasped the chair beside her for support, and in a voice that was even less steady than before, made answer 'I am Lady Leinster's daughter—Wilfred's wife. Shocked though I am and surprised as I am I must repeat that this is the truth.'

Mr Pontifex, who had been sitting unasily to and fro on the hearth, now began to arch his gray eyebrows very evenly enough, as if he saw that matters were taking a queer turn that had been usual in his long experience of common place persons and events. He took off his gold-rimmed spectacles, rubbed the glasses and re-adjusted them on his nose, and then stepped forward, clearing his voice before he said, some what awkwardly, for even a lecturer can be bashful 'This is a painful scene, very painful to me, I can assure you, Lady Barbara. There must be some grievous mistake, or some over-estimation, to account for—I repeat—this unhappy affair.'

Lady Barbara, with a face that was very grave indeed, drew herself up to the full height, and said earnestly 'Miss Carew—Miss Carew! I appeal to you to give up this most unseemly contest, and be your better self again. I entreat you, if I do our duty, not to continue this ill-judged claim, which in but trouble the peace of the family with which you are connected, and which must be such a weight to yourself.'

She to whom this speech was addressed made answer 'Lady Leinster Montecore, I can prove what I say.'

Her sister here broke in almost in a whisper 'I see it all!' she cried 'I see it now clearly, only too clearly. It is the doing of that wicked Frenchwoman, that so-called Countess de Malovre, with whom you, my poor married Cousin, were, unhappily, so intimately on good terms, on our voyage home from Egypt. She is who has prompted you to this, and she whom I feel sure of it for my own sake, but I will never of her. It hurt—Ah it is terrible—here!—Cora, during my poor, loved Cora, listen to the phrasing of your letter and I will undeceive the awful fancy—just up this cruel wrong to her who loves you, and take my full and free forgiveness, dear, and your two sister's lifelong love.'

'Never' was the passionate rejoinder, amidst stormy sob-s—'never!' You madmen me! I—I am indeed—Clare—Lady Leominster!' And the girl, sinking on the sofa now her buried her beautiful head among the silken cushions and wept with a passion of grief that could not be checked. Lady Barbara's expostulations went for nothing, she did the useless and the soft words of the sister who knelt beside her. Mr Pontifex, elevating his bushy brows into the form of the Saracenic arch, took prodigious quantities of his highly scented snuff as he surveyed the scene.

For a long time—it seemed long, but a period of excitement cannot be accurately gauged by the matter of fact standard of mere seconds and minutes—the weeping girl resumed as it were alone with her own thoughts, and paid no heed to the remonstrances of Lady Barbara or to the entreaties of her sister. At last she rose, pushing back as she did so, with an impatient gesture, the golden hair that hung drooping over her temples, and with a set stern face, that indicated a courage strangely at variance with her youth and appearance, and slender form. 'Lady Barbara, she said resolutely, 'I have made up my mind, and will stay no longer where my word is doubted, and my position defined. I shall leave this house. I shall go to London. With my brother I can find a refuge, until it is proved—well, I am resolved it shall be—that I am Miss Anne of Leominster, and should be mistress here.' There were no tears in her eyes now, though she was pale, and her features had hardened to the cold beauty of sculptured marble. She never faltered in her resolve, and Lady Barbara, who was used to speak with authority, felt the words of well-meant expostulation die away upon her lips.

Mr Pontifex, who had been restlessly rubbing his plump hands together, and blinking like an elderly owl in the daylight now came to the front. 'May I ask, he said in a quick business-like tone, which indicated a certain inward sense of satisfaction at his own possession of mind, 'which lady wears the wedding ring?' His eye fastened as he spoke on the marble white face of the beautiful girl who had last spoken. Instantly she matched off her glove, showing the golden circlet on her slender finger. The other, too, slowly unlaced her hand, whereon also glinted a wedding ring!

The lawyer, like Lady Barbara, was for a moment struck dumb with astonishment. He stood for a little, as if considering what to do next. Then he spoke. 'Allow me to ask,' he said, 'if none of the servants who have attended with you can help us out of this difficulty?' 'Yes,' said the sister who had declared her intention of quitting the house for London, 'call Pinnett, my maid, she travelled with us from Egypt.'

Pinnett was called. 'There is a slight difficulty here,' said the lawyer in his best judicial tone to the maid. 'Will you be so good as point out to us which of these two ladies—indicating the sisters with a wave of the hand—'is my Lady the Marchioness?'

There was no hesitation in Pinnett's manner. She promptly turned towards them, and pointing to the sister who had first entered the room

and addressed herself as the widow to Lady Barbara, said 'That is the Marchioness.'

'Oh, Pinnett,' cried the sister about to be exiled, 'how had you the heart to do it?'

The lawyer, with mobile eyebrows and pursed lips, retrieved a pace or two and again sought counsel from his snuff box. But Lady Barbara, fairly shocked at the deliberate duplicity which had been exhibited before her eyes, drew herself up to her full height, and said slowly and firmly to the sister who had last spoken 'Miss Carr is chosen her path in life. She had better set up to her expressed determination, and—go.'

Then worthy Mr Pontifex again came forward. He must, he begged to remind Lady Barbara, be in London that night. He should be most happy, as an old friend and liquid adviser of—ahem! both families, to escort the young lady, whose position at Castle View could not be otherwise than distressing and difficult, to her brother's house in Beaton Street.

'I know Sir Lulford,' (was well, very well,' he added, 'likewise old Sir Pishman, and have seen Sir Pishman, and shall be glad to be of service in this case, no.'

'You are very kind, sir—I thank you. I am ready,' said the girl, speaking in the hard, mechanical tone of a loop walker, as she turned towards the door.

'Come!' pleaded her sister, but quit in vain.

'Rest all refreshment at home—Lady Barbara! go!

'I want nothing, was the cold reply, 'when Mr Pontifex is ready to go, I am so.'

Lady Barbara rang the bell. A servant who answered the summons received orders to send round the carriage that was to convey Mr Pontifex to the station.

'The young lady's luggage!' said the lawyer in an audible whisper.

'It shall be sent to-morrow,' replied Lady Barbara magnanimously. 'We will have what is necessary in immediate requisition unpacked and placed in the carriage.'

'My maid has all the keys,' said the sister of his who was about to depart, with a cold, firm the lady's English home so recently reached.

Very soon the final arrangements were hurried through, and the carriage was announced.

There was a busy time taking on the part of Mr Pontifex, who was anxious to shoulder a painful scene. I shall without a word or gesture of farewell, the pallid beautiful girl, upon whom all eyes were bent, turned to go. Twice she spoke, first as she left the great drawing room, and again after she had traversed the huge hall, and was crossing the outer threshold. 'I shall come back,' she said each time—I shall come back, and be mistress here,' but she uttered the phrase in the same cold monotonous cadence, as of one who talks in sleep. Never once did she look at her sister, never once did she reply to the words which that sister continued to address to her to the last. Her demeanour was unchanged as she sat in the carriage on its way to the station, and in the train on its journey to London. When, in the lawyer's company, she was in the cab that rattled through the gait metropolitan thoroughfares towards her brother's bachelor abode in

Bruton Street, the married half unconsciously, but in a tone too low to catch the ear of Mr Pontifex 'The de re cant, I must assert my own I cannot spare her now'

(To be continued)

# BOOK GOSSIP

A more interesting book comes ■ hand on the much debated and vital question of the treatment of our poorest class. It is entitled, *Social Workings: A History of the Law of England as they affect the Poor* (London: Lohman), and is from the pen of Mr Isaac Peck, a gentleman whose experience as a member of the London School Board, and as an earnest and sympathetic investigator into the condition of the poor, render him qualified to speak on a subject which must always owe much to practical inquiry than to mere abstract thinking. A few years ago Mr Peck issued a little book dealing with 'Our Laws and our Poor,' which he received at the time much and for useful consideration from the press. This book, being now out of print, the author has wisely judged that, instead of reprinting it, he would let the new edition be published, and the course he has taken, by publishing the present volume, which, while it contains all that is still valuable of the former, includes the matter which further study and experience have led him to believe worthy of consideration by the student in the subject.

Mr Peck is strongly of opinion that the law of England, so far as they affect the poorer classes of the community, and especially in need of reform. As regards the law of the poor, he writes, 'there is a universal sentiment of opinion among those who have studied the subject, that the influence of these laws in the past, and to a great extent in the present, can be now administered, is to discourage provision, and to foster the very evil in society which they were intended to cure. He thinks further that the influence of the law at present is to encourage the dishonest and idle to throw themselves and their families on the parish, and that this influence should be changed, and a healthier sentiment introduced amongst the poorer classes, by the necessity of providence and thrift being somehow by law introduced, and the criminality of improvidence and idleness made clear. This is very much in the line ■ social reform which he frequently has taken in the pages of this *Journal*, and to our mind presents the only feasible and hopeful way out of the existing chaos of discontent and misery among the classes referred to. The workhouse system as respects children, our author believes to be intrinsically bad, and advances many startling facts in evidence of this view. He would replace it by introducing a system already tried in Scotland with success, namely, to board the children out in families, with reputable people of their own rank in society, and thus save them from the baneful and softening influences of home life, instead of having them herded together in large workhouses, where the influence ■ each upon the other is the reverse of good. Both in point of economy and of moral results, the boarding out system is shown ■ be greatly superior to that of the workhouse.

The chapters on the licensing laws and intemper-

ance, on the marriage of justice, and on crime and its punishment, are equally suggestive and practical. In the concluding chapter, he deals with a specially difficult and delicate aspect of the question by discussing on 'the uncharitable acts of inadequate relief.' He urges the necessity of careful discrimination in the bestowal of all relief of the poor, whether such relief be given by the poor law authorities, by benevolent societies, or by private persons. 'If any relief is to be beneficial, not only must it be bestowed after thorough examination, but when given, it must be adequate. In fact, the bestowal of inadequate relief is no charity.' To bestow a dole, for instance, for the relief of a man who has been thrown into poverty by want of work, is, in his opinion, to leave him very much what he was before, with the additional evil, that he may thereby incur the luxury of eating bread in idleness—a vice which he may not speedily learn. In such a case, Mr Peck says, that careful inquiry should be made into the man's circumstances, outside work found for him until permanent employment is obtained, and rent support being meantime provided to sustain his health. 'This action,' he adds, 'is not only a true fulfilling of the law of love, but is true economy.' We do not think this can be doubted, but the difficulty about it is that it would give 'benevolent and charitable people so much extra trouble—it is so much easier to fling the idle man a shilling or a loaf, and be done with him.

We cannot enter into all the details of the system which Mr Peck sketches, but we have no hesitation in saying that none who have the same end in view as to assist their less fortunate fellow creatures, and are anxious to be effective, but will find it their profit and wisdom to read Mr Peck's book.

\*\*\*

When Prospero, on the morning after the tempest, tells his daughter Miranda how he had been taught by the deities of an unworthy brother out of his dukedom of Milan, sent to sea in a creaky vessel, and stranded on this solitary island where Ariel found him and became his guardian spirit, he accounts for his misfortune by indicating that he had loved his books better than his title and all that belonged to it.

If poor men—my library  
Was dedicated large enough

The love of books is indeed a happy, though not, alas! always a fortunate, quality, a quality which, when once get thoroughly infected there with, is not to be removed from the blood by any surgical or medical treatment whatever. James the First of England expressed the hope that, if it should ever be his fate to be imprisoned, it might be in a library. 'What a place,' says Charles Lamb, speaking of Oxford, 'to be in is an old library.' It seems as though all the souls of all the writers that have bequeathed their labours to these Bodleians, were now pouring here, as in some dormitory, or middle class.

Moreover, those who love books like to hear what others say of them—they are about the only friends of whom we can speak our minds plainly without in any way offending them. And especially pleasant it is to hear what those who are themselves great authors have got ■

to us about books. As one means of gratifying this literary appetite, we do not know anything more pertinent than a beautiful little book which has just been published, called *The Book Lover's Dictionary* (London: Sampson, Marshall, & Co.) This book lover's handbook contains 'Thoughts on the Selection and Comparison of Books,' selected and arranged chronologically by 'Philobiblon,' who must himself, to judge by his pseudonym and the opinion of his work, be very blessedly and safely infected with the disease above referred to. In this book you have, in its motto from Malwre rightly in her place, 'Infinita. niches in a little room,' the selected wisdom ranging from Malwre right down to Carlyle and Ruskin. All the extracts are good—very bit within their covers is sweet and toothsome, and many of the anonymous authors follow suit, within the chromatic circle of local literature, will thank him heartily and gratefully for the delightful supply of 'meat' for the mind.

*Winters' Almanac for 1887* is before us. It is one of the best books of its kind, and on which we think might be better known in England than it seems to be. It gives an immense amount of useful and even attractive information on all the different branches of government administration at home, with an account of each of our colonies, and some abroad. It also purveys, plentifully, chronology, and many other things, and is the chief resource of the school and the library, the public and all those who, for the first time, take to themselves with unalloyed pleasure.

## FOR HIMSELF ALONE

A TALE OF RICHMOND AND LIME

### CHAPTER IV

Orlando and Lima sat for a little while in silence. The former had brought a book with him, the latter her pen. At last the latter could contain herself no longer. 'I think, you are ill ought to be ashamed of yourself,' she burst out.

'I don't say I ought, dear, but I am,' responded Lima with a low laugh.

'The way you carry on with that odious Mr. Drummond is outrageous,' she said.

'Whom feelings have I outraged?'

'You were actually seen walking out with that man before breakfast.'

'I like somebody to walk out with, and "that man" is very amusing. Some people are not amusing.'

'He's a proper—a absolute proper.'

'Yes, poor fellow. He's a terrible creature.'

'Some people are poor, but still agreeable, but Mr. Drummond is thoroughly odious. He seems to be always taking people off behind their backs.'

'He is rather clever as a man. You should have heard his imitation of the conversation between you and Charley Sargeant the other evening on the terrace.'

'What impertinence!'

'You spoke rather loudly, you know, and Mr. Drummond and I were close behind you. Pointing to the door, you said to Charley, "Mark how those stately globes of liquid light are swimming; certainly one is on it." This was rather too far fetched for Charley. All he could say in his usual low, slow style was, "Ah—yes—very good—just as if there was some fellow up there holding 'em up one after another, you know."'

'You are as bad as Mr. Drummond,' said Clara indignantly, and with that she flounced away to the other end of the seat.

Neither of them spoke for half five minutes. Then Lima said, 'Clara,' her cousin took no notice, so, after waiting a minute, she said calmly, 'Clara, dear.'

'What do you want?' asked Clara ungainly.

'I want to ask you a little dear.'

'My advice, Lima,' answered her cousin, turning half round. 'You know you are always welcome to this. I only wish you would follow it more frequently.'

'A friend of mine,' began Lima, keeping her eyes anxiously fixed on her cousin's face, 'a girl whom I know at school, has lately been married to me. She is a very nice girl, but her position, but she is very rich, very rich. Her husband is a clerk in the City, with a salary of a hundred and fifty guineas a year, and she lives in great comfort. My friend has written to me to go and see her. What would you do, if you were me?'

'Not what, dear her acquaintance, of course. Tell me more about it. Is it better than if you had never received it? If it will do so far forward what they owe to their lives and others to many children a hundred and fifty pounds a year they must take the consequences.'

'If it would do no harm in my opinion, I should be for it.'

'I do not dispute with you, Lima. If I had a sister, and she were to marry herself as you intend to, I would not speak to her again as long as she lived. With these words, Clara calmly turned her head.

'So that is what I may expect from my friends when I marry Dick, may I? Lima with a little doubt looked in her eyes. 'In place of course. Well, if they can do without me, I can do without them.'

At this moment, Mrs. Preworth appeared in the doorway, her hand, homely face looking somewhat red and flushed. Dick perceived her from where he sat, started to his feet. 'Ah, what are you going to eat? he called. 'Come and keep me company.' He drew up an other chair, and she sat down beside him. 'What is the matter?' he asked. 'You look worried.'

'It is a little peckish. What a trouble they are! They won't turn out as they ought.'

'Why don't you have all those things to the servants?'

'Servants indeed! I'm surprised at you, nephew. A pretty man they would make of them. I think that must be an eclipse somewhere about. My grandmother used to say that

050  
CHAS. J. XX

whenever there's an eclipse of the moon, it's sure to turn your pickles yellow."

"Remarkable woman, your grandmother," remarked Dick enthusiastically.

"That she was!—was she who taught me to milk, and I was christened after her—Baby. Yes, my dear boy!—lowering her voice—"my husband calls me Lennora because it sounds aristocratic, but my maiden name was Betty Cleary; my father was a durian in Leekhampton, and I used to have my cows to milk every morning of my life."

"I've a great respect for cow milk in Leekhampton, sir."

At this moment the host of the argument that was being sustained in Mr. Polworth's party caused Mr. Dempsey to clasp his voice over his mouth. Mrs. Polworth and Dick turned to him. He was addressing Dyson. "I tell you, sir," he said with emphasis, "that my husband so far succeeded in dominating the natural dignity of this particular man, that the humblest greatest pleasure was to sit me down as from the extended hand of his master."

"Ha, ha, ha!" laughed Dyson over his fist. "A remarkable story, truly! Now, when I was in the Punjab—"

Mr. Dempsey was told with a sudden fit of sneezing, while Mr. Polworth swept his letters and papers to the end of the room from his seat.

"There we, dear me, I had no idea it was a late, remarked Polworth, after consulting his watch. "And I have several letters to send off by the forenoon post!" He moved slowly to his seat. "Lennora, my love, I want you," he said to his wife in his most delicate tone, "to be seated here and Dick on his way to the house."

"Now, what can Algernon want in the?" remarked Mr. Polworth to Dick. "I'll be something wrong, I know there is, for the way he spoke to me. She said no more, but followed her husband into the house."

"It strikes me," muttered Dick to himself as he looked after them, "that Mr. Algernon Polworth is one of those by no means uncommon characters—a philanthropist abroad, but a bully at home."

Mr. Dempsey had risen, and was getting his letters and papers together. "I can't stand that Punjab story, sir," he whispered to his wife.

Mrs. Deane had crossed to the table and was selecting a flower. "Mr. Dempsey, I challenge you to a game of croquet," she called out with a mischievous glance at the old man.

"Only too charmed, Mrs. Deane," he answered with a grimace, "but there's a sort of clerical stupidity about croquet that I have never been quite able to master."

"It is never well to abuse what you don't understand, Mr. Dempsey."

"If Mrs. Deane will allow me," said Dyson, rising with alacrity.

"Only too delighted, Captain Dyson."

"Dyson has quite a genius for croquet," sneered Dempsey.

"Some people have no genius for anything," remarked Mrs. Deane with the most innocent and imaginable smile.

She and Dyson strolled off together towards the croquet lawn, the last words conveyed to those who were left behind being "When I

was in the Punjab, Mrs. Deane"—The rest was lost in the distance.

"Horrid first!" exclaimed Clunie spitefully as her eyes followed her cousin. "I must rescue the little Captain from his clutches at any cost."

Mr. Dempsey crossed the lawn, and went indoors with a very sour look on his face.

Clunie and Dick were left alone.

No one else did Clunie Polworth find himself at ease with Mrs. Deane and then she proceeded to peep at him round a clump of evergreen. He was leaning back in his chair in his favourite attitude, with his hat tilted over his eyes. "He can't really be ugly," said Clunie to herself. "Not three minutes ago, he was talking mamma!" She strolled slowly towards him, humming a little air under her breath, and swinging her straw hat in one hand with an air of engaging innocence. She was just close to him, when suddenly she checked, started, and nearly fell into his arms. "Oh my!" she cried—"the horrid wasp!"

Dick sprang into the air, springing to his feet, waving Clunie into the chair in which he had been sitting, and bowed her as he did so. "Oh! What! Wasp! Where? Dick, pray a lampshade to too much for me. But cousins may kiss. He said so in the Punjab, I know."

"You are a horrid man, related Clunie with a pout."

"I know I am a horrid man, but you needn't remind me of the fact. But where's that wasp, wasp?"

"Gone! It went sailing away over the shrubbery."

"I don't think it wanted to sting you, Clunie, only to nip the hours of your life. I don't blame that wasp. He set down on a chair beside her. "What have you here?" he asked, taking a book from her under the table.

"A beautiful volume. Fitzgibbon's *Asphodels of the Soul*. But you don't care for poetry."

"How do you know that? In any case, I'm open to conviction—Good! read us 'What's this?' The halcyon and the hawk's custom, and he now read out the two following lines:

"Fish and a wall ten it can go to earth,  
Beneath in the other half a waking."

"It's often heard that murmurings are made in heaven," remarked Dick, "but I never knew till now that we are murdered before we are born. What a comfortable life!"

"You are approaching the putrescent Cousin Frank. But perhaps you have never studied the doctrine of the three Asphodels—of spiritual unions and its out mortal birth."

"Can't say that I have. But how easily one might perpetrate a very, without knowing it."

"Mark how splendidly the poem opens," exclaimed Clunie with willful enthusiasm. "Then she began to declaim:

"Soft flying leucoræa of the Jovial sphere,  
Whence Aphrodite rising through the vane,  
Sweet as kin strains hand ones, and then no more,  
A mediating crowd that sweep through Mercury's  
meadowy oases."

"Vastly pretty," said Dick, with a humorous smile in his eye. "Clunie's moaning awakes me especially fine—But what does it all mean?"

Oct 1887

'Ah, Cousin Frank, I'm afraid you have no soul for pity.'  
'That must be the reason why I'm so poor.'  
'It is quite evident that you have never been in love.'  
'I believe I am very much in love—with myself, and I once hit a thoroughly bull target that I'll not adore.'  
'And yet there must be a sympathetic chord in your bosom.'  
'I'm glad it's not round my neck.'  
'A chord that needs only to be touched by Love's tiny fingers to disengage a rich sweetest music.'

'Good gracious!'  
'But music that will some day be threaded to another—music that will never be heard by me.'  
'So much the better for you, Chinnie, and if I were you I would try to find some weaker steam elsewhere,' said Dick not unkindly. 'There's Captain Dyson, for instance, who was looking eyes at you over the breakfast table. He is young, rich, sporting—why not try to find a sympathetic chord in his bosom? Who knows but that he may have a vein which is pulsing vainly for its other half, and that you, too, both of course, may have that other half which alone can make the life of Captain Dyson happy?' He changed his tone abruptly. 'Ah, but Cousin Drummond, he said drily.

'That is not Mr Drummond! He's always to be found where he is not wanted, and I cannot pretend. Then putting on a dishevelled air, she added, 'I thank you for your counsel, Cousin Frank. Some day, perhaps, you will understand me better.' She turned thoughtfully into a side walk as she said these words—I may as well go in search of the Captain at once, she murmured under her breath.

Proboscis came slowly forward. He looked very much better in health than when we last saw him. He was solemnly dressed in a black frock coat and grey trousers.

'I hope I have not interested your feet at all,' he said to Dick as soon as Chinnie had disappeared.

'Not at all. I'm glad you came when you did. Mademoiselle Chinnie has been doing another little "try on." She either can't or won't see how useless such attempts are.'

'And yet she's sharp enough in most things.'

'She's sharp on the old man's side, I suspect.'

'Probably so. What a hypocrite he is!'

'What about the Patent Crane Company?'

'As "boques" as several of the other concerns he is mixed up with.'

'Drumpey and Dyson have both promised to invest.'

'Do them good to burn their fingers for once. Make them more wide awake for the future.'

'Do you wish me to invest?'

'You may do so,' replied Frank, 'to the extent of a couple of thousand.'

'At you will lose your money.'

'We must delay giving the cheque for a few days. Meanwhile—'

'Yes—unwhisk!'

'The time may come. I'm going to put

Ploworth to the proof before many days are over.'

'To the point!'

'If he's the rogue I suspect him to be,' said Frank, 'he will succumb to the temptation I shall put before him, and then, you be to him!'

'But it not?'

'In that case, he will disown me as a rogue, and advise you to have me kicked out of the house.'

'And then will come the crisis?'

'I try!'

'I don't like you,' said Dick whimsically, and drawing a long breath.

'Why?'

'I'm getting tired of the both. There's too much expected of a fellow like the man who carries two punnets a week on his head to be his own master, but the man with eight thousand pounds is your everybody's slave.'

'You must pay the penalty of the position,' said Proboscis with a snarl.

'Butter the point in my eye. Give me independence. Why am I as by law and as by too good a plan for me. Since I have been here six months, I shall be paying for my two put back in 'sober, for my old black overcoat, my trousers and putch, and for Polly Laxton to fetch me my shirt and make every morning's eleven.'

Dick was, in fact, and studied his lanky person. 'By the by, he went on, 'that letter you handed to me this morning was from Bruce Layton. I had been gone on from our old lodgings.'

'And what does the dear old boy say?'

'Nothing of importance. But wishes to you, of course, but apparently has not heard of your good fortune. Expect to be in town in the course of a few weeks. Was glad to see this notice in the *Fourth Avenue* of my picture in the *Daily Globe*, and it put it may be the means of bringing me about me.'

At this moment, a servant in livery came up to Dick. 'A deputation to see you, sir, about the almshouse at Fiddlerscomb Hill,' he said.

Mr Drummond frowned. 'Thus will the third deputation within the last ten days!—I'm turning to the verge,' he added. 'Till the gentlemen that I will be with them in a few minutes.'

'What have you to be afraid of, man alive?' asked Dick with a laugh. 'Prune them to give the matter your best consideration, and get rid of them in that way.'

Dick merely shook his head, and without another word, reached off two old tin boxes with a gloomy and preoccupied air.

Proboscis sat down on a garden chair, and drawing a letter from his pocket, he read it carefully through for the second or third time. His face darkened as he read. 'It was a happy thought to put Mr Gumps confidential clerk Whiffles on the track of my respected uncle,' he muttered to himself as he put away the letter. 'But the reality proves to be even worse than I suspected, the shadow of the picture is blacker than I thought they were. And he would mangle his orders now—the nephew to whom he professes to be so devoted—into the

be worked by the hand of a lady. Twenty years ago, the largest gun aloft was the five-ton naval gun. In order to bring it into action, several men were required. With wooden levers, they managed with great exertion to move its clumsy carriage to right or left, much in the same way that labourers urge heavy blocks of stone along a road. Now, the touch of a handle brings into accurate position a mass of metal twenty times the weight.

A foreign technical journal gives a way to recipe for preserving silver and plated articles from turning black, as they invariably will if not kept constantly in use. The same plan could with advantage be applied, we should think, to any metal subject to change or rust from the action of the atmosphere. Plain collodion—that is, photographic collodion—is diluted with twice its bulk of spirits of wine, and applied to the surface of the metal with a soft brush. The spirit soon evaporates, leaving an impenetrable and transparent skin, which is a skin which requires to be removed with alcohol.

Dr. W. Siemens, the indefatigable inventor of things both great and small, has recently patented a new explosive, which, although exhibiting double the energy of gunpowder, is far less dangerous to prepare and to handle. It is a mass of a mixture of nitric chloride of potash, and some solid hydrocarbon, such as pitch, asphaltum, gutta serena, &c. This is intimately mixed together after having been repeatedly pulverised. After this treatment, a liquid—such as oil of wine, ether, &c.—which will dissolve the solid hydrocarbon is added, and the whole is formed into a plastic mass. After being rolled into sheets or cakes, the volatile liquid evaporates, leaving a hard mass, which can be rolled up into a mass like ordinary gunpowder. The intensity of explosion can be regulated by the size of these grains and by the proportion of the various constituents. The chief merit of the new compound seems to lie in the safety with which it can be manipulated during manufacture. If it is any means catch fire, the liquid first burns away, after which the solid remains is slowly consumed.

The excitement caused by the recent transit of Venus has hardly subsided before astronomers are called upon to prepare for another event of almost equal interest. On May 6, there will be a total eclipse of the sun of unusual duration, for the sun will be obscured for nearly six minutes. This will give time for observations, photographic and other wise, which will be fully appreciated, and which will probably add much to our knowledge of that luminary upon which our light and life are dependent. Unfortunately, there are only two little spots—tiny islands in the South Pacific—which the line of totality touches, the rest of it has crossed the boundless ocean. The French astronomers have already taken steps for making observations, and it is not with a view to finding the truth of Leverrier's hypothesis as to the existence of planets nearer to the sun than Mercury.

Nearly thirty years ago there was exhibited at the Palais de l'Industrie, Paris, a bar of white metal bearing a label describing it as 'Silver from clay.' The metal thus extravagantly named was really obtained from clay, but was not silver, but aluminium. This metal has several excellent

properties which would cause it to be much valued in the various arts. It is so light that an ounce of it is three times as bulky as an ounce of silver, it is malleable, malleable, not liable to tarnish, and is very beautiful in appearance. Unfortunately, the process of extracting it from its original clay is so costly that its price prohibits its use except for certain purposes of luxury or adornment. Many attempts have been made to cheapen its production without success. But the present time there is a rumour abroad that the problem has been solved. It is stated that a ton of the metal can now be produced in a well at a cost of a hundred pounds. If this be true, it will come into common use for a great variety of purposes. Its price has hitherto been from five to seven shillings per ounce.

According to the experience of most poultry owners, winter is a bad season for eggs. The fowls cost more than in summer, for they can get no natural food out of the hard ground, and they must make up their loss by increased consumption of artificial food, for which they make no return whatever. According to an article which appears in the *Gardener's Chronicle*, this should not be the case, the fowls being with the owner, and not with the stock, when eggs are scarce. Lords hatched in May (1 June) should be looked forward to as winter fowls, the grand amount being in the nature of the food with which they are supplied. This is the dietary recommendation. The first thing in the morning, give a lump of mixed bread with a water of ale, and milk, and wheat, and for the first time in the afternoon. In June (1 June) this will of itself be sufficient to put in giving abundance of eggs during the coldest season of the year.

During the last few months, several shocks of earthquake have been experienced at Panama and various places near it. This has occasioned some surprise, because, although adjacent to Central America and notorious for such visits, it is that part of the isthmus upon which Colon and Panama stand, the terminal points of the projected interoceanic canal—has hitherto been free. Indeed, this immunity from volcanic disturbance has been one of the chief advantages urged in favour of the Colon and Panama scheme against the various other alternative routes proposed. In a map recently published by the particular portion of the isthmus is coloured, to indicate its happy freedom from such disasters. We fear that this must now be altered.

At a recent meeting of the Paris Académie, the subject of the decreed *Phylloxera* again came to the front. M. Dumas stated that the Commission formed to combat the ravages of the pest had recommended as a primary measure the destruction by fire of all vines showing traces of infection. This action was resisted, owing to the fear of French legislation regarding rural property, and the Commission had given in. An official Report from Switzerland has since proved the soundness of the plan advocated by the French Commission. In the cantons of Geneva, Vaud, and Lucerne, where the burning process was adopted, and the owners compensated by a small tax on most fortunate vineyards, vines representing a value of forty millions sterling had been saved at the expense of a few thousand pounds. The penny-wise and

pound foolish policy can afflict nations as it does individuals.

Professor Gulley recently read a paper before the Society for the Promotion of Agricultural Science at Montreal, containing some very interesting notes regarding the food value of cotton seed and the oil obtained from it. When properly refined, this oil is largely used for cooking purposes, taking the place of lard. The cotton seed cake, or meal, is found of great value for fattening cattle, but the seed itself, when boiled and mixed with any kind of dry or starchy, is so nutritious that much increase in weight is attained when fed upon it. Under such treatment, a few rich bulls, the oil from the seed appearing to form the principal ingredients in their diet, contained within them, as to manure, fertilizers, &c.

A most important engineering work, which will represent a great addition to the utility of our Indian possessions, is now approaching completion. A railway sixteen hundred miles in length, commencing from Calcutta to P. Benares, that is, to the town of Allahabad, about which we heard, runs through a few years back. The only line in the line is that of Allahabad, a line, east on the Indus, it is twenty miles south of P. Benares. The line at this point has recently been overhauled, a bridge of boats is set in the river, and a wheel the current is so too turbulent for such a contrivance. Now, however, in the last, the work will soon be complete, having in its length, a mile is one hundred and thirty feet above the water level, and a lower road for ordinary traffic. This great work will represent one of the most important railway systems in India, which, under the Government, greatly benefits by the line, of about ten thousand miles of rails.

Twenty years ago, in the North Island, of the island, the important discovery was made that certain deposits of salt, analogous to the of Cheshire, were situated near the shore of the river Tees. For various reasons, however, we need not enter, the discovery has not been utilized until quite lately. The mineral of sodium, the first was what novel. A bore hole sixteen inches in diameter and in its length of feet deep was cut in the deposit. In this hole a tube is fitted, while the tube itself is driven by a very powerful arrangement. The tube is always full of water, the fresh water is pumped, at the top, and the fully saturated brine, by reason of its greater specific gravity, at the bottom. The pump is employed to remove this lower stratum, which is constantly renewed. The salt is then crystallized out in evaporation, pure after the usual manner. Messrs. Bell & Co. have now the first salt works which have been established in the Tees—are situated in a position to produce nearly four hundred tons per week. The importance of the establishment of this industry in a new neighbourhood can hardly be overestimated, and is likely to lead to important additions to our northern chemical works. Those who only sit at the dinner table will hardly understand the value for more important work it is put. It constitutes an indispensable item in paper making, dyeing, bleaching, glass making, and a host of other important trades. It has been said that the wealth of a country can be

very well gauged by the amount of sulphuric acid which it annually consumes. The same remark could be true if applied to salt.

The official crop Report for 1882 of a portion of Manitoba and the adjoining territories of the Canadian North-west has been issued. It is compiled from information collected principally by the postmasters of the various localities, eighty-four districts being represented, comprising about one-fourth the whole area of settlement at the present time. The average yield is shown to be: Wheat, thirty bushels to the acre; oats, fifty-one and a half bushels; thirty-eight and a half; potatoes, two hundred and seventy-seven and a half; turnips, on the average, five, fifteen, twenty, thirty, thirty-seven. The average yield of corn is shown in the eighty-four districts to be: a few hundred and seventy-two thousand even bushels and seventy acres. The average yield of alfalfa to each settler in several districts is estimated at over thirty bushels. Altogether the yield is a most satisfactory one, and is a general state of contentment and prosperity in the territory. The Canadian and the Railway Company have now completed their main line, which is hundred and six miles between Winnipeg, and one hundred and fifteen miles to the south-western branch, and which will have upwards of one hundred miles of rail through this fine country, thus giving the settler ready communication with the great market. Altogether the Canadian Railway will have about two thousand miles of railway in operation, which will be a great advantage.

The report of the Clyde shipbuilding, for the first year, is that the industry has been very largely pushed. The total output of the various yards in the Clyde basin in one hundred and ninety-seven is about one hundred and eighty thousand tons, and the amount of fully fitted vessels in the year of 1897, and of one hundred and twenty-five tons, the output of 1898, which was exceptionally large. The amount of work done in the year of business has been the greatest amount of steel tonnage, and of sixteen, ship tonnage. In all, more than three hundred of one hundred and twenty-ton tonnage were constructed in 1897, while the tonnage of vessels constructed in 1898 is about two thousand tons, about half the amount of the preceding year. Only one hundred and twenty-five of one hundred and twenty-eight tons, built of wood. The value of the work done in the year is roughly estimated at one million pounds, against eight million in the previous year. It is the largest total production in the Clyde.

The returns from the Clyde shipbuilding for the year ended in 1897 show that the year's work was valued at one million one hundred and twenty-five thousand and seven hundred and twenty-five tons, and valued at nearly eighteen million pounds, were built in them. Roughly calculated, nothing like one hundred and twenty-five even if it is not much more than half the tonnage of the vessels which make up the tonnage named, and about twenty thousand men will be employed in their construction. Of these work in ports, Glasgow, as above stated, with its one hundred and twenty-

one vessel, of three hundred and eighty near thousand tons, stands first—as indicated it stands first among the ship building rivers of the world. Next to the Clyde comes the Wear, on which one hundred and twenty three vessels, of two hundred and twelve thousand four hundred and sixty four tons, have been built. After the Wear comes the Tyne, with one hundred and thirty two vessels and two hundred and eight thousand four hundred and six tons, the Hartlepool takes the fourth place, with thirty nine vessels and sixty eight thousand and sixty seven tons, and the Tees comes in fifth, with forty vessels and sixty five thousand and forty eight tons. Five and twenty years ago the Wear was at the head of the list, with New York running at a close race. When iron became the chosen material, New York turned, the Wear lagged behind, while the Clyde took the first place, and the Tyne the second. Of late years, however, the Wear has been running the Tyne very close, and has this year, as we have seen, outstripped it in tonnage.

Regarding the project for building an observatory on the summit of Ben Nevis, and for which a sum of five thousand pounds is required, it is satisfactory to learn that a good many names have been put forward among the same, numbers of noblemen and gentlemen giving handsome subscriptions to the fund. The object of this project was alluded to by Mr. Winge in an article in our paper—titled Ben Nevis in Winter—in April last year.

In a paper read before the Royal Society, Dr. William Miller has explained a method devised by him for photographing the corona of the sun at any time when that luminous is visible. Hitherto this was only possible on the occasion of total eclipses of the sun, and if the direct method should prove itself trustworthy and practicable, it will enable observers to study the corona of the sun, not only at the time, but for a few minutes in the course of a series of years.

The Committee appointed by the Treasury to report on the employment of convicts labour in the construction of harbours of refuge have now named their report. The places suggested by the Committee are Dover, Limerick, and Peterhead. Dover and Limerick claim the preference on account of their proximity to harbours of refuge, and in the case of Limerick, on the coast of Yorkshire, is being a most important centre for the fishing industry, and for the protection of boats and trading vessels. Peterhead, in Aberdeenshire, is recommended for a similar reason, there being at present no harbour of refuge for merchant or other vessels along a coast line of two hundred and fifty miles, extending from the Firth of Forth to County Limerick.

## QUITS

### A COMMERCIAL TRAVELLER'S TALK

OLD commercial travellers will tell you that in many respects the profession is nothing to what it was, though for our own part we are inclined to think that in many respects the profession has improved. The penny post, the telegraph, the enormous expansion of the railway system, have wrought such changes in the mode of doing business between town and country, that in the

Commercial Rooms of country town inns, where, in the 'good old days,' a whole gentleman would have assembled of an evening, one nowadays meets but two or three. Much of its old character, also, has departed. Before the era of railways, when men and horses might be detained at an inn for days by stress of weather or badness of roads, jollity and free and easy ways were a very prevailing characteristic of the commercial traveller, and the reckless jollity of the fraternity—for a fraternity it was, almost monastic in the regularity of its rites, and the exactness of its etiquette—passed into a proverb.

But to our story. This happened to be a snug party of commercial gentlemen assembled in the Commercial Room of an inn in one of our quaint South country towns, one winter evening a few years ago. The cloth had been removed from the table, the customary toasts had been duly honoured, and the company, some half-drawn in number, had drawn their chairs round the fire, lit their pipes, and each with his glass of port at his elbow had evidently made up his mind to be as comfortable and as cozy as possible.

The conversation was being monopolized by Mr. H. L., a vulgar, puffy faced, bald-headed man, with a large exposure of shirt front and much ostentatious jewellery, who was standing with his back to the fire, his hands tucked under his coat tails in the orthodox Irish fashion. The other men, who were all younger, were listening with the respect due to a representative of the old school of commercial travelling, occasionally an approving remark, dutifully laughing at every story, but in no way interfering with the great man's pursuit.

'Ah!' he said, wrinkling his fat brow into a series of parallel creases, and waving almost noisily up at the ceiling, 'travelling isn't what it was. There isn't no fun now days. You young jinks don't know what it means, for railways have knocked it all on the head. It was something, I can tell you, to turn out of a warm bed at four o'clock of a winter morning, and jump into the trap for a twenty mile round before breakfast, so that the hoppers shouldn't get the start of you. Now days, you jump into your train with your huddles and your wraps and your mornin' paper, and you take your time over matters as comfortable as can be. You don't seem to have the spirit we had, though, I work it and we had our fun to, I can tell you. You work, but you don't seem to have no time for fun.'

'In what way do you mean, sir?' asked the looker-on of the audience.

'What way?' repeated the great man. 'Why, I mean the dodges and larks we was up to.'

'What sort of dodges and larks?' asked the other.

'Oh, all sorts!' replied the old gentleman. 'There's so much humbug and etiquette about nowadays. It's what you call bad form for a gent to play a trick upon another. I've known all sorts of things done. They used to hoist one another's drink, so as to make the hoppers sleep heavy the next morning, lock their doors in the outside, change their boots, tell the

'Quick and easy, sir, quick welcome,' said Mr.

'Me sorry?' said Mr. Hooks with contempt.  
'Not me. All's fun in love, war, and commerce.

and if I hadn't done it, he'd have done me by cutting me out of a lot o' business. As it was, I never set eyes on him again, and I've tried he got the sack from Hanks and Noker—Sorry! Not me!"

There was an expression on the faces of some of the young men as if they thought it was rather a low trick, but they made no remark, and after some further conversation, a general yawning and knocking out of pipes and drawing of gloves proclaimed the hour of tea. So the good Mr Hicks took up his candle and departed, his example was quickly followed by the rest, and the little old gentleman who had been writing his letters, was left alone.

When the door had closed upon the last bed-gear, he shut up his writing, and took up the position in front of the two lively occupied by Mr Hicks. Something in the story he had heard caused him to tinkle his fancy immensely, for he set it there chuckling at himself and rubbing his hands as in great glee. "Never chap that! Uncommonly clever chap!" he muttered to himself. "He's quite right. Young Brownsmith did give up travelling, and if he hadn't, he wouldn't be one of the richest men in the county, as he is now."

He rang the bell for the waiter. When the man appeared, the little old fellow said: "What time does Mr Hicks shut up his business in the morning?"

"Well, I hardly know, sir," replied the waiter. "You see, he don't come here regularly—in fact I can't call to mind never seeing him before. But the gent's mostly gone out about ten o'clock."

"Tell the boys to call me at seven, will you?" said the old gentleman, and taking his walk, he went to bed.

The next forenoon, Mr Hicks transferred majestically forth from the inn upon a round of wheels, and as he walked along he seemed absorbed in the contemplation of his own figure in the shop windows, as if anticipating with no small degree of pleasure the sensation such a representative of Hanks and Snooker would make in the shops of the humble tradesmen. He entered the establishment of Mr Willow, who said upon his door that he was patronised by the Royal Family, but scarcely not to a fifth part of the manner in which he was patronised by Mr Hicks.

"Anything in our way, Mr Willow?" said the great man condescendingly. "Hooker and Snooker, you know!"

"Nothing for Hooker and Snooker," replied Mr Willow solemnly.

"Nothing, Mr Willow, nothing? Are you quite sure?" asked Mr Hicks, somewhat annoyed.

"I've said nothing, I think," said Mr Willow. "I'm busy. Please, go away, there's a good man."

Mr Hicks left the shop slowly and wonderingly. "Surely," he thought, as he walked on to his next customer—"surely no one's been meddling with Hooker and Snooker. No orders from Willow! It's unaccountable."

He entered the shop of Mr Burslem, who, not being patronised by Royalty, preferred not to be

patronised by any one, and who had the reputation of being a curt, sharp, short man of business. Mr Hicks entered, and on the principle that time is money, did not detain his business, merely indicated the names of Hooker and Snooker, and stood with his order book ready open.

"Nothing at all, my good man," said Mr Burslem. —"Nothing at all—Good morning!"

"Nothing at all"—began Mr Hicks, fairly bewildered.

"No, nothing at all. Good morning," put in Mr Burslem, so that there was nothing to be done but to return it with ruefully and out.

"Now, there is something wrong," said Mr Hicks to himself as he stood on the pavement outside Mr Burslem's door. "My two last customers, and no orders! I never knew it before, never! Who can it be? Young Jones was here two months back and got forty pound old in orders. And I, Joseph Hicks, the chief traveller to Hooker and Snooker, am told that there's nothing for me! "My good man" too, forsooth! I must try Mr Cole."

He entered Mr Cole's shop. Mr Cole was not there, but appeared in a few minutes. Mr Hicks went straight to the point. "Mr Cole replied immediately. "Not to day, Hooker and Snooker I am supplied!"

"Supplied!" almost choked Mr Hicks.

"Yes, supplied!" said Mr Cole, but not a syllable more.

Mr Hicks was now fairly roused. Suddenly, the recollection of his tale in the Commercial Room on the preceding evening flashed before him. Could some of the young fellows have been playing him a trick similar in nature to that which he had played many years before on young Brownsmith? Seeking his anger and mortification as best he could, he strolled on to the shop of his last customer, Mr Ironstone.

"Nothing to day, Hooker and Snooker," said Mr Ironstone before Mr Hicks could put the question.

"Mr Ironstone," said the astonished Hicks, in an almost pathetic tone of appeal, "will you tell me if any one has been before me, and has done the business which hitherto Hooker and Snooker have performed for you?"

"Ho! er and Snooker still do our business," said Mr Ironstone.

"Well, but I represent 'em," said Mr Hicks. "Come, come," said the dealer soothingly, as if he was speaking to a child, "don't take up my time, there's a good fellow. I've told you that I have no orders, so go away quietly, or I shall be obliged to call your keeper."

"My what? My keeper?" roared Mr Hicks. "What do you mean, sir? Surely you don't think I am a lunatic!"

"I don't think it, I am sure of it—I turn it," replied Mr Ironstone, and coming round the counter, he gently took Mr Hicks by the arm, and led him from the shop, and shut the door after him.

Mr Hicks stood as one dazed for some seconds. The building seemed to reel around him, and he felt that with a little more he would actually be out of his mind. Then he strode back to the inn, resolved to make a terrible example of the plotters that evening.

He was very moody and silent at dinner, and the young fellows saw that something was gone wrong with him, so he scowled terribly over his food, and only answered with brevity to the questions put to him. Afterwards, when, according to custom, the chairs were drawn round the fire and the best part of the day begun, Mr Hicks rose majestically and assuming his usual position in front of the fire, peered his thunder with a loud 'Ahem!'

'Gentlemen, it is with regret, sorrowfully mixed with disgust, that I am forced to address you upon a certain subject—upon a subject which is as disagreeable to me as it must be humiliating to each of you as are concerned. In short, some of you, taking a malicious advantage of my attempt to amuse you last night, have been playing me a under and trick.'

The gentlemen thus addressed took their paper from their mouths and gazed at Mr Hicks with amazement.

He continued: 'The day for this sort of thing has gone by, and it all becomes members of an honored profession to indulge in tricks of which a schoolboy would be ashamed. To be plain with you, gentlemen, I have been picked off in the town as a lunatic, and consequently have found the doors of my most important communications shut against me.'

In spite of the very manner in which Mr Hicks spoke, there was a way perceptible on the faces of the young men around him, which he was not slow to observe.

'I see nothing to laugh at in this, gentlemen, he continued, suppressing with difficulty his rising wrath, 'in fact, there are some of you who will probably have very good reasons for regretting it, when I tell you that and I find out which of you is the offender, I shall write to your respective governors, with a view of having the matter thoroughly gone into.'

One and all declared that they were utterly ignorant of the matter, and with such emphatic protestations against the malignity of the trick, that Mr Hicks was forced to believe them.

'Perhaps the little old gentleman who was writing at the side table last night knew something about it, suggested one of the men.'

Mr Hicks rang the bell for the waiter. 'Water, he said, 'is the gentleman who came in here from the coffee room last night in the case?'

'Mr Brownsmith, sir—O no, sir, he went away this morning, and he gave me this note to give to you, not before this evening,' replied the waiter.

'Mr Brownsmith! Is that his name?' cried Hicks, in a faint voice.

'Yes, sir,' answered the waiter. 'He owns half the town, sir, and was just locking into his property.'

Mr Hicks opened the note and read as follows:

MY DEAR SIR—You were good enough, some forty years ago, to play me a trick which might have ruined any other man for life, or at least have retarded his progress very seriously. I am not very vindictive, but I never forgive you for it, more especially as I have had no opportunity of repaying you. We are at last quits. You are beyond the reach of actual harm now, as I presume you have fastened your nest pretty

comfortably in forty years, but as a man is never too old to learn a lesson, I hope by the return trick I have played you this morning, that you have learned one—I am, sir, your obedient servant,  
SAMUEL BROWNSMITH.

## OCCASIONAL NOTES.

## SOME MARRIED WOMEN'S PROPERTY ACT.

In the number of this Journal for 31st December last, we gave an analysis of the Act passed last year affecting married women's property in England. It may be useful if we point out here that the Married Women's Property Act for Scotland, passed in 1881, differs in some respects from the English Act. In cases where the parties are married after the passing of the Act (July 18, 1881), if the husband have at the time of the marriage his domicile in Scotland, the whole movable and personal estate of the wife, whether acquired before or during the marriage, is vested in her as her separate estate. But she shall not be entitled to assign the property in her name, or to dispose of it with her husband's consent, by gift or otherwise. The investments, as in England, must be kept separate and distinct in order to protect them against claims by the husband's creditors. The rate of heritable property in such cases is 10 per cent. of the value of her separate estate. The Act has only a partial application to the property of women married previous to the above date, and does not affect any settlements. But the parties may, by the execution of a deed, require the same position under the Act as if they had been married subsequently. The husband may, however, who may die domiciled in Scotland at the passing of the Act is to have the same share and interest in her movable estate as he would have in his estate after his death, that is, one-third, in case of three heirs, children surviving, otherwise, one-half.

## VACCINATION FOR SPOILED MILK—IMPORTANT RESULTS.

This month we give an article on the subject of experiments with diseased milk, entitled 'A Sanitary Soup Kitchen' (p. 27), in the course of which reference is made to Pasteur's discoveries in connection with epidemic fever in animals. Since that article was written, a paper has been read by M. Pasteur before the Académie des Sciences, giving further results arrived at by him, and which are of extreme importance.

The experiment of the Euxine at Lour in France, in case in which typhoid fever has always been very prevalent, and after the successful results of the experiments which were made eighteen months ago near Paris, the future of the disease determined. M. Pasteur is ready. In the course of the past year, nearly 10,000 sheep, between four and five thousand head of cattle, and five hundred horses, have been vaccinated, with what good effects may be gathered from the following statement. The number of sheep vaccinated within the year has been seventy-nine thousand three hundred and ninety-two. For the last ten years the average annual loss from liver rot has been seven thousand three hundred and twenty-six, or nine per cent. Since the introduction of vaccination this loss has

been reduced to five hundred and eighteen, or to less than one per cent.

Among the flocks which have been only partially vaccinated, there were two thousand three hundred and eight sheep vaccinated, and one thousand six hundred and fifty-nine not; and the loss among these was only eight for the two thousand three hundred and eight vaccinated sheep, while it was sixty among the one thousand six hundred and fifty-nine unvaccinated sheep. It is worthy of note that these sheep were brought from different parts of the department, and that the vaccinated and unvaccinated ones were all fed and treated in the same way. The veterinarians of the Eure-et-Loir have vaccinated during the year four thousand five hundred and sixty-two head of cattle, and there have been only eleven deaths, the rate of mortality being thus reduced from over seven per cent, at which it stood a year ago, to less than a quarter per cent. Horses were not vaccinated to an general extent as cattle and sheep; but out of the five hundred and twenty-four subjected to it, only three died.

#### THE BROKEN TOY

A broken toy ! what memories bring  
Around this half forgotten thing,  
What baby laughter seems to rise,  
Like old, delightful melodies,  
What shouts of wisdom, tender joy,  
At sight of this poor broken toy !

Oh, tiny feet that would not rest !  
Oh, dear head pillowed on our breast,

What would we give to hold again  
The form we lost, 'mid tears and pain !  
Ah, child ! the empty cot is ours,  
But thine the sunshine and the flowers !

What could we give thee, shouldst thou come  
To smile again upon thy home !  
Such little pleasures as we know  
In that, our twilight life below ;  
Some fragments of earth's giddy joys,  
A handful of its broken toys !

How calm thy lot—for once blest,  
How exquisite thy happy rest !  
How changeless, joyful, and serene,  
Compared with what thy lot had been  
With us—a home fleeting, clouded joys  
Are at their best but broken toys !

The Conductors of *CHAMBERS'S JOURNAL* beg to direct the attention of CONTRIBUTORS to the following notice.

1st All communications should be addressed to the Editor, 359 High Street, Edinburgh.

2d To insure return in case of ineligibility, postage stamps should accompany every manuscript.

3d Manuscripts should bear the author's full Christian name, surname, and Address, legibly written, and should be written on white (not blue) paper, and on one side of the leaf only.

4th Communications of Verse should invariably be accompanied by a stamped and directed envelope.

Unless Contributors comply with the above rules, the Editor cannot undertake to return unsuitable papers.

Printed and Published by W & R CHAMBERS, 47 Paternoster Row, LONDON, and 359 High Street, EDINBURGH.

#### A FEW WORDS TO OUR READERS.

WITH the present Monthly Part, the fifty-second volume of this *Journal* begins, and the fifty-first year of its existence is completed, while, to judge by its circulation, the magazine seems to be in ever-increasing favour. For this and numerous other marks of approval at the hands of our readers throughout the world, our heartiest thanks are due.

Observing as far as possible the lines laid down half a century ago for the conducting of *Chambers's Journal*, it shall still be our constant endeavour to provide a weekly and monthly budget of literature at once wholesome, instructive, and entertaining, nor shall our vigilance be relaxed in withholding matter that might offend even the most sensitive.

With a watchful eye to Science and Art, and all that is currently interesting regarding them, we shall likewise increase our efforts to entertain our readers with anecdotes, tales, and serial fiction; and by commingling with these, occasional essays on subjects of social and economic importance, we hope still to elevate as well as to amuse.

In short, it shall be our earnest care jealously to preserve and guard that Standard from which we have never swerved, and which has carried *Chambers's Journal* unscathed through endless competition.

## LOST CITELS

SCATTERED throughout this and foreign countries, we find extensive traditions respecting cities buried beneath the land or water, which, although occasionally grounded on fact, have in most cases a purely legendary origin. It is true that in years gone by, the images of Nature, caused either by earthquakes or encroachments of the sea, have ruthlessly swept away many a smiling village, yet this explanation does not satisfactorily account for the popular notion of lost cities, which, like so many other subjects of a kindred nature, is involved in uncertainty. It has been suggested that it may have sprung from the well-known myth of the 'Happy Isles,' a tradition which is found amongst nearly every nation of the globe, and which formed an object of belief amongst the Greeks and Romans of old, and still enters into the folk-lore of the Irishman, the Welshman, the Hindu, and the Red Indian of to-day. Indeed, one may still occasionally hear, in Wales, sailors speak of the green meadows of enchantment lying in the Irish Channel to the west of Pembrokehire, which, they say, are at certain times discernible, although very quickly lost to sight. There are even traditions of sailors who, in the early part of the present century, went upon one of the fairy islands, unaware that they were such until they returned to their boats, when they were amazed at finding the islands disappear from sight. The fancies who inhabited these islands are reported, says Mr West Sake, in his *British Goblins*, 'to have regularly attended the markets at Milford Haven, making their purchases without speaking, and occasionally rendering themselves invisible. The peasantry of Milford Haven, too, firmly believed that these islands were densely peopled by fairies, who went to and fro between the islands and the shore through a subterranean way under the bottom of the sea.' Some antiquaries have conjectured that the tradition relating to these Happy Isles is a relic of a primitive legend associated with Eden, but the question is one involved in much obscurity, and

upon which there is a wide diversity of opinion. Without further discussing the origin of this class of legendary lore, we would give a brief outline of some of the principal instances recorded in well-known localities.

Thus, near Rokeby, in Nottinghamshire, there is a valley which popular tradition in the north has called Effingham, was caused by an earthquake many hundred years ago, when the whole village, together with the church, was completely swallowed up. So deep rooted was this belief, that in years gone by, it was customary for the inhabitants who resided near this valley to assemble together every Christmas morning for the purpose of hearing the ringing of the church bells under ground, which it was regarded might be distinctly heard by stooping down and listening to their peals beneath. There are numerous superstitions of this kind, it being a popular notion, that in those localities where churches have been buried by an earthquake, the bells still ring deep in the earth on Christmas morning. At Felstrey, near Killy Lemdale, there is a curious kind of natural hollow scooped out, which, says the legend, was once a church, prison, and people were swallowed up. Ever since this terrible occurrence, it is asserted that the church bells have been regularly heard to ring every Sunday morning.

In the same way, the cities which have been swallowed by the sea are supposed to appear about the water's edge on Easter day, or to be visible by moonlight in the still depths of the water, their bells being at times heard sounding dimly below. Thus near Blackpool, about ten miles out at sea, it is related that there once stood the church and cemetery of Ailghnal, long since submerged. Even now, however, the melancholy chimes of the bells ringing over the restless water are occasionally to be heard, he said, especially in rough and tempestuous weather. At Crosmare, near Eillemore, Shropshire, 'where,' as quotes a correspondent of *Notes and Queries*, 'there is one of a number of pretty lakes scattered throughout the district, there is

a tradition of a chapel having formerly stood on the banks of the lake, and that the bell once was, that whenever the water was ruffled by wind, the chapel bells might be heard as ringing beneath the surface. Referring to these sunken bells, it may be noted that their supposed sound is generally considered by sailors as ominous, and to prognosticate misfortune of some kind or other. Hence, we may quote a bell legend connected with Jersey. Many years ago, the twelve parish churches in that island possessed each a valuable peal of bells, but during a long civil war, the bells were sold to defray the expenses of the troops, they were accordingly sent to France for that purpose, but on the passage, the ship foundered and everything was lost. Since that day, during a calm, three bells always ring from the deep. And the fishermen of St Ouen Bay sometimes go to the edge of the water before embarking, to listen if they can hear the bells upon the wind, for if so, nothing will induce them to leave the shore, but if all is quiet, they fearlessly set out.

There are numerous legends of sunken cities scattered through fiction, some of which are of a most romantic origin. Thus the spot now covered by the Lake of Inchiquin is reported in former days to have been a populous and flourishing city, but, for some dreadful and unexplained crime, tradition says, it was buried beneath the deep waters. The dark spirit of its king still rovides in one of the caverns which border the lake, and once every seven years at midnight he comes forth, mounted on his white charger, and makes the complete circuit of the lake, a performance which he is to continue till the silver hoofs of his steed are worn out, when the curse will be removed, and the city reappear once more in all its bygone condition. The peasants affirm that even now, on a calm night, one may clearly see the towers and spires glimmering through the clear water.

With this legend we may compare one told by Burton in his *History of Ireland*. 'In Ulster is a lake thirty thousand paces long, and fifteen thousand broad, out of which ariseth the noble northern river called Bann. It is believed by the inhabitants that they were formerly wicked vicious people who lived in this place, and there was an old prophecy, in every one's mouth, that whenever a will which was threaten, and was continually covered and locked up carefully, should be left open, so that a quantity of water should issue thereout as would forthwith overflow the whole adjacent country. It happened that an old beldam coming to fish water, heard her child cry, upon which running away in haste, she forgot to cover the spring, and coming back to do it, the land was so overrun that it was past her help, and at length she, her child, and all the territory were drowned, which caused this pool that remains to this day.' Geraldus Cambrensis, too, notices the tradition of Lough Neagh having once been a fountain which overflowed the whole country, to which Moore thus alludes:

On Lough Neagh's banks, as the beldam sings,  
When the clear old eve is dawning,  
He sees the round towers of the days  
In the wave beneath him shining.

It may be remembered also, that Crofton Croker, in his *Fairy Legends of the South of*

*Ireland*, relates how beyond the of Clark, just outside the town of water, at the bottom of which and gardens far more beautiful to be seen. The legend runs, that Saxon foot touched Irish ground, great king called Clark, whose palace the lake now is, in a green valley. In of the country was a spring of fountain and clear that it was the worst neighbourhood far and near. On one however, when the king was giving entertainment, it happened that in the the banquet one of the guests said to the 'May it please your Majesty, here is so in abundance that but can wish for water.' 'Water,' replied the king, 'ye speedily have,' and despatching him on the fair Ugg, who soon unlocked the door, well, but stooping down, she unfortunately her balance and fell in. The water at once and speedily filled the green valley in which the king's palace stood—a judgment, it is supposed, upon him for having closed the well against the poor.

Once more. On the west coast of Ireland, near the cliffs of Moher, a long distance out at sea, the waves appear continually breaking in white foam even on the calmest day. Tradition says that many years ago a flourishing city was swallowed up for some terrible crime, and that it becomes visible once every seven years. It is further added, that if the person who happens to see it could but keep his eyes fixed upon it till he reached it, the city would be restored. It is unnecessary to add further instances to show how extremely credit is given in Ireland to this superstition, which, it has been suggested, may have partly arisen from optical illusion, where the shadow of the mountains and various fantastic features of the landscape are reflected from the calm and unruffled bosom of a lake. Thus, and a servant to an officer who was quartered in the west of Ireland—'If, on a fine summer evening, when the sun is just sinking behind the mountains, you go to the lough, and get on a little bank that hangs over it on the west side, and stoop down, and look into the water, you'll see the finest sight in the whole world—for you'll see under you in the water, as plain as you see me, a great city, with palaces and churches and long streets and squares in it.'

Passing from Ireland to Wales, tradition says that the well known town of Aberystwith was formerly a long distance inland from the sea, an extensive tract of country, stretching for miles where water now rolls, having been once a flourishing and thriving district, cultivated and inhabited by a numerous population, dwelling in villages and towns, cities and castles. One day, however, the sea rose far beyond its usual height, and flooding the country around, formed Cudgyn Bay. This tradition has been preserved in prose and verse, and geologists are in opinion that it is not entirely without foundation. According to another version of this legend, related by Mr Andrew Roberts in his *Gleaming Glades to Wales*, it seems that 'the steady advance of the waters had caused the inhabitants to erect sea walls, and when the rivers discharged themselves into the ocean, floodgates were constructed,

which were always closed at high water. The keeper of the floodgates, one night, when the people were asleep and the tide unusually high, got drunk, and either neglected to see the gates properly closed, or in his cups opened them himself. Anyhow, the plain was deluged, the people were drowned, towns and cities alike being destroyed.

Putting tradition aside, there can be no doubt that in past centuries the sudden and destructive encroachments of the sea occasionally swept away wide districts of land, and gave an impetus to this kind of legendary lore. Thus the town especially true of the North coast, and it is a well established fact that the village of Cromer— which of late years has become a fashionable little watering place—was in years gone by an inland hamlet, another village having originally stood where the sea now comes to and fro. Dunwich, again, now a mere village on the Suffolk coast, three miles and a half from Southwold was once an important, populous, and commercial city. Here, we are told, 'were certainly six or eight parish churches, besides three chantries, the Temple Church, which probably belonged to the Templars, and afterwards to the Hospitallers, the houses of Franciscan and Dominican friars, each with churches.' The city, however, being situated on a coast destitute of rocks, gradually yielded to the violence of the sea. In the reign of Henry III., it is recorded how the king wrote to the Mayor of Sudbolk to assist the inhabitants in stopping the destruction. In 1677 the sea reached the market place, and in 1709, St Peter's Church was directed of its head, timber, billy, &c., and in the year 1818 Dunwich, it is said, 'consisted of only forty two houses and half a church.'

The ancient Looe is generally considered to have been washed away at an early period by the sea, for, till the 24th year of Henry VIII., the remains of a blockhouse upon an isolated spot were to be seen at low water about four furlongs east of the present beach. Show, describing the great tide of 1604, says: 'The sea lay like an over the banks of the Thames and other rivers, drowning many towns and much people, with innumerable numbers of oxen and sheep, at which time the lands in Kent that sometimes belonged to Duke Godwyn, Lord of Kent, were covered with mud and drowned, which are thus dry called Goodwin Sands. Lastly, we find in Cornwall numerous legends relating to lost cities, some of which, it would seem, are founded partly upon fact. Thus, the Scilly Isles, it is said, were once united to the mainland by a tract of country known as the 'Lydwane,' which, according to the *Scilly Chronicle*, was destroyed on the 11th April 1099. Mr Warner, in his *Town through Cornwall*, says that although 'the records of history do not rise so high as the era when this disjunction happened, yet we have documents still remaining which prove that this island must have been considerably widened, and the number of the Scilly Isles greatly increased within the last six or seven hundred centuries by the waters of the Atlantic, receding probably from the coast of America, passing towards the coast of Britain, and over the whelming parts of the western shores of Cornwall. Again, that beautiful and romantic spot, St

Michael's Mount, opposite the little market town of Marazion, and about three miles and a half from Penzance, which is a small island from the mainland at high tide by the sea, is supposed to have been originally surrounded by a dense forest. This idea is strengthened by the fact that the remains of trees have been discovered in its neighbourhood, and also from its Cornish name, which means the 'Grey Rock in the Wood.' Beneath the sands on the coast near Hayle, tradition says, the castle of Theodoric, king of Cornwall, has buried, and this on certain occasions some of the Celtic stories can be discerned. Looe is also affirmed by the Cornish primary to have been in former ages a city of considerable dimensions, having been swallowed up by an earthquake.

To quote a further instance, recorded by Mr Hunt, in his *Popular Romances of the West of England*. It gives us that once there stood on the northern shore of Cornwall a city called Langanec, which in its best days possessed seven churches, each of which was famous for its size and beauty. The inhabitants were wealthy, deriving their riches from the fertility of the land and from the sea, which yielded them abundance of fish and had the city criminals were sent from various parts of the country, and made to work in the mines. Unhappily, however, their prosperity had a bad influence upon the people, who rose up to sinful pursuits and pleasures. At length, the wrath of God eventually descended upon them, and one night a violent tempest arose, raging with unbridled fury for three days and nights. At the end of this time, the city had entirely disappeared, being buried beneath the sandhills which the wind had heaped together on that ill-fated spot.

## ONE FAISE, BOTH FAIR,

OR, A HAND TWO!

BY JOHN B. HARWOOD

### CHAPTER V—SIR IACOB

'Cheer up, though, Sir Pagan! Come and see that way. And if Prince Arthur didn't win the Cup, it was no fault of the dog, after all.'

'Never thought it was, Weston,' was the curt reply.

'Nor yet it wasn't the trainer's fault, Sir Pagan, promptly rejoined the first speaker. 'A better greyhound on a stumper never started out of a ship, and he came in primo condition, fresh to point, to the post—he did, and with only five to three laid against him at the list. And if there hadn't been that damned dog mill at the foot of a judge, hadn't ruled it against Prince Arthur, the thing was—'

'There, there, Weston!' broke in the baronet roughly but not unkindly, 'don't hush up that old story again. I've heard enough of it, and it's always much to the same tune, and ends somehow in having my pocket emptied then before you didn't come up to day nicely to tell me why my dog didn't win the York Cup. —Now of the man who they!' he added hastily, and with genuine anxiety.

'No, Sir Pagan, they're all right, the beauties, and fit as'—the speaker hesitated for a moment, in search of an adequate simile, and not finding one at once apposite and unhesitating, ended his phrase meekly with 'belike'—but that man's quite all I made bold to run up to day to ask you for a cheque, Sir Pagan.'

'And you couldn't have come at a worse time, I can tell you that,' returned his employer impatiently, as he tapped hard with the well-known knocker of his angular right hand on the battered mahogany table by which he stood.

'Now, Sir P,' began the trainer persuasively, 'we must be reasonable, Sir P—sarcasm's well—and look at both sides of the thing. I have expenses, heavy expenses, to keep up my place on the Belknap Downs. Haven't I got wickets to pay—up, and to keep up to them work—besides wicket-keepers to watch the wickets? There's rent and taxes, there's the lads, and the vet, and the training, which requires no lads, but expert and old men. I do justice to the dogs—every gentleman owns that, but I've a duty, Sir, to my own family, and I can't be the 19s paying out and never putting in, can I, Sir Pagan?' A hum died in nothing to you.

'Isn't it, though?' rapped out the baronet petulantly. 'I tell you, Weston, as I told you before, that it's dead low water with me, and that there isn't a fellow in London under present thin myself. Lettuce keeps chasing the old ones like a Will o' the Wisp, I think, to lure me on through bog and quagmire, and drive me beyond my reach. I could almost wish, Sir, that I'd never had a horse of my own, or a dog. I've a mind to cut the whole thing, drop my hounds like a hot potato, sell my all plain Pagan Caw, and run off to Australia. At any rate, I could dig.'

It was evening already, and the gas that had been lighted in the dusky, windowless room of the grim old house in Bruton Street, threw its yellow gleam upon the two figures to this conversation, such a type after his kind. Mr Weston, the trainer, was a stout man of middle age, whose buff waistcoat, neatly laid crease of pale blue, and wholesome, clean shaven face, indicated nothing that was usually associated with a mercenary connection with dogs, horses, and the turf. His appearance was almost indistinguishably respectable, and his shrewd blue eyes, a trifling, perhaps, retuned almost a boyish curiosity when they met those of a customer or patron. Yet Joseph Weston had been a trainer of race horses before he was a trainer of greyhounds, and of his character remained as honest as his looks, he was an astonishing example of how it is possible in any calling to avoid the pervading contagion of roguery.

Very different was the aspect of Sir Pagan. A young man still—he was in reality thirty and twenty, but looked older by half a dozen years—he showed not the faintest resemblance to his two beautiful sisters. Nay, more, a hasty observer might have failed to class him as a gentleman, but a more patient scrutiny would have satisfied that error. Sir Pagan was emphatically a gentleman, and the remembrance of the fact, and that he was a Carew of Carews, steadied him, and supported him somehow in the midst of wild comrades and evil counsellors. The baronet—

it was Charles II who gave the honour of the UK to Red H and to his ancestor—had not begun his career under very favourable auspices. His grandfather had been a magnificent local spendthrift, his father a ready but ostentatious improver of the deeply dugged family property. Sir Pagan, half educated, found himself the representative of the grand old name, and the master of the famous mansion, with an estate that bore mortgages rather than crops, and a traditional obligation to keep greyhounds, to hunt the country, and to contest elections, as his forefathers had done.

Then the heir of the ancient house stood, in his dingy dining room in Bruton Street, his miniature hunt resting, on the graceful head of a noble greyhound of the old-fashioned Yorkshire breed, too old, now, to win money for the master, whose almost insupportable fear he was. Personally, Sir Pagan was a dark haired man of average height, with a well kept figure, a snubby complexion, and kind features. His name is never liked him. But there was something in Sir Pagan's ugly face, when you came to know him, which pleaded in his behalf—a cautious watchfulness, as if he would be better if he could, which he may read in the eyes of more than one specimen of the genus to which he belonged. His education, it has been said, had been sorely neglected. Beyond a certain narrow practical ground, his education was superficial, but then he had the grace to be aware of it, and to be sorry that it was so. As a hawking, hunting gentleman, like those only Sir Pagan whose oddly sounding baptismal appellations cropped up so often in his Devonshire pedigree, the baronet would have done very well. He could have charged with Rupert—doubtless enough. He would have won credit had he sided with Effingham against the invincible Arnold. In the nineteenth century he was an antiquarian, much in a fashion of the Perceps, in pleasure and war paint, would be in the hunting, the cocking, to day. All his life long he had been painfully short of cash, and he knew no way to riden the waning balance at his banker's but by winning bet or stake, by a lucky deal in horses, or by cards. He was in evening costume now, being engaged some in company at a well known Club, the Grosvenor, where play ran high, and was therefore in a hurry to be rid of his trainer, the more so as a hundred for a fifty coin was to him a source of misery.

The rapid driving up of a cab, and the clang and peal of knocker and door bell, interrupted the colloquy between Mr Weston and his employer, and then followed the tramp of feet and the murmur of voices, and stranger still, a sound as of stifled sob in the narrow entrance hall. Before the baronet could recover from his surprise, the door of the dingy dining room was hurriedly flung open by a nondescript man with half grown, half broken, who blurted out the words, 'Lady Louisa's, Sir Pagan—that is to say, Mrs Caw—and Mr Pontick.'

Sir Pagan could hardly believe his ears. He came forward, half mechanically, to receive the girl, in mourning garb, who tottered rather than walked into the room, putting out both her trembling little hands to meet that which

the baronet somewhat awkwardly extended to her, and next, breaking down altogether, sank upon the chair nearest to her and sobbed as if her heart would break.

'No one but you, now, neither—no one but you!' she said, in a low wailing voice that it was very sad to hear.

Sir Pagan winced perceptibly, as though the words, or the tone of her broken wretchedness, in which they were uttered, came home to him as a reproach. Fraternal affection is not a quality very strongly developed or very cleverly displayed in modern English life, but Sir Pagan, at the sight of his sister's distress, could not but feel that as a brother he had been rough and careless. 'There, there, Clara—don't cry,' he said with clumsy kindness, as he bent over her. 'I'm glad to see you, but it does take a fellow about, somehow, when he hadn't a notion—Mr. yes, Mr. Pontifex—beg your pardon, I'm sure.' And he clutched the little lawyer's fleshy hand between his own strong fingers with a force that made the visitor wince. 'Pray, sit down—so very kind of you—thanks!' and Sir Pagan looked round the room in bewilderment, until he espied the trainee, who was now slowly sliding towards the door. 'Another time, Weston! I'll write—or come!'

'Good evening, Sir P,' replied the discreet Weston, as he slipped out and softly unlocked the door.

Th still grieved, and a low wailing like to that of her sister, extremely subdued and hid his handsome head for a moment on the arm of the slender girl, who remained in a crouching attitude in the chair into which she had fallen, and then slowly returned to his station at his master's feet. This master, sorely puzzled, looked first at his sister, and then at Mr. Pontifex. The latter, having cleared his throat, and first wiped and then deliberately adjusted his gold-rimmed glasses, began nervously in explanation, the only immediate object of which was to make his sister told the very natural perplexity of his host.

'By Jupiter, sir,' exclaimed Sir Pagan at last, dropping down his heavy hand upon the dined and scratched mahogany of the heavy old table, whereon may a scint had smoked under the Georgian reigns, 'I don't wish to be rude, but this will drive me mad, I think. I understand you say that it was my sister Clara—the Marchioness—that you have brought here with you to-day, and now you hint that it is Cora—I thought it is from the first—and what's all that about Lady Barbara somebody, and Oswald Vawr, and the painful business, and so forth! What has happened! All I can gather is that there has been a row of some sort!'

'Excuse me, Sir Pagan,' replied the polite little lawyer, 'I did not venture to commit myself in any decided statement as to the identity of the lady who—'

'Do you not know me—brother!' exclaimed the sobbing girl, pushing back her veil, and letting the gleaming streams fall upon her agonised face.

'No, upon my honour, I don't, for in truth it's so many years since—' blundered out the young baronet in his bluff way. 'But don't cry, dear! You're my sister, anyhow, and you

are welcome. I'll do my best.' And again Sir Pagan looked distractedly at the solicitor.

'I am Clara—poor Clara,' she answered, and then, after a pause, went on: 'I have come to seek shelter, come to take refuge with you, Pagan, until I can prove what I say. You are not angry with me, are you, brother dear, because I—because I come to you?'

The last words were so touchingly uttered, that rough Sir Pagan's own voice was a little husky as he replied, patting her gently on the shoulder, as if she had been a child. 'No, no, never think that. You mustn't mind me, you know. I was always a bear, wasn't I? I'll do my best, though—well—and— Mr. Pontifex, one word with you—Back in no time, dear! And with a last ceremony, Sir Pagan whisked the plump, clerical attorney out of the room, and into a den which the master of the house called his study, and which, so far as Mr. Pontifex could see by the dim light of a candle that his host had watched up in traversing the narrow hall, was littered with a wild confusion of fishing tackle, whips, boots, spurs, and other paraphernalia of the chase, a pair of giant antlers being nailed above the main chimney piece, but which contained never a book. The owner of this delectable library turned sharply upon the lawyer, glad, as it seemed, to speak his mind to a man, undisturbed by the presence of the hysterical sex.

'Look ye, Mr. Pontifex, he said, 'one thing out of this muddle is clear, and that is, this you men will and mean kindly, but all the rest is a little to me. I don't take sides myself, in rows between women. And by Jove! sir, I am no more fit to decide in such a matter than my dog. But in Clara and Cora were always alike—wonderfully alike—somebody must be sure to spot the right one, but I, anyhow, wouldn't risk anything, on my own judgment. In any case, she is my sister, poor thing.'

'And therefore can I not on a refuge and friendly sympathy here, Sir Pagan, if I appear to be right?' said the lawyer.

'Just so,' answered Sir Pagan, kicking the rusty fender. 'Of course I see that something's dreadfully wrong—somebody's not playing on the square, but in any case, Cora—or Clara—must stop here till it's put to rights.'

'Then I have only to take my leave, Sir Pagan,' said Mr. Pontifex, and with a tolerably good grace submitted his plump and fleshy hand to a second experience of the baronet's vice-like grip. Then Sir Pagan re-conducted his visitor to the street door, where the cab was still in waiting, and when that hired vehicle had gone clattering off, Sir Pagan slowly returned to the room where he had left his sister.

## PLAY

A shorter time ago, one of our greatest living English musicians received a visit from an intimate friend, who had arrived unexpectedly from the country at a somewhat early hour of the forenoon. When admitted into the house, the visitor at once made his way to the composer's study, and, perceiving on the close and cordial nature of their long-standing acquaintance, entered softly unannounced sheets of music—

paper lightly scored, covered the desk and the table, and even overflowed on to the carpet—telling, of a rich brain harvest of harmony reaped by the midnight pen. Bulky manuscript books lay open here and there, and displayed their cabalistic hieroglyphics, pencilled within ‘bars,’ like so many ink maps, grotesquely struggling over the pages. The piano was open, and a violin and bow, lying in juxtaposition across their empty case, seemed to indicate that the maestro’s ideas had taken visible form and expression but a short time before.

But what was the maestro doing, since his pen lay for the moment idle, with its ebony blood oozing on the blotting paper, and violin and piano mute? Facing the room with knitted brow and fu off (yes) Tearing his hair in a fine frenzy of agonised inspiration? Gazing at the newly risen sun in search of the divine afflatus? Not just this, at myrate. Standing with his face turned a little away from the door, and consequently unaware for several moments of the presence of an intruder, he was ~~peering~~ <sup>holding</sup> three oranges, keeping them all in <sup>one</sup> <sup>hand</sup> <sup>and</sup> <sup>with</sup> a dexterity of <sup>finger</sup> <sup>and</sup> <sup>thumb</sup> <sup>as</sup> <sup>an</sup> <sup>artist</sup> <sup>in</sup> <sup>his</sup> <sup>profession</sup> <sup>of</sup> <sup>juggling</sup> <sup>and</sup> <sup>manipulation</sup> <sup>that</sup> <sup>which</sup> <sup>he</sup> <sup>had</sup> <sup>learned</sup> <sup>no</sup> <sup>other</sup> <sup>than</sup> <sup>he</sup> <sup>has</sup> <sup>acquired</sup> <sup>and</sup> <sup>practised</sup>. Now high, a considerable amount of now slower, now high, now low, now faster, hand to the <sup>other</sup> <sup>apparently</sup> <sup>revolving</sup> <sup>from</sup> <sup>one</sup> <sup>direction</sup> <sup>to</sup> <sup>the</sup> <sup>other</sup> <sup>in</sup> <sup>regular</sup> <sup>rotation</sup>, now with <sup>the</sup> <sup>hand</sup> <sup>and</sup> <sup>out</sup> <sup>backward</sup> <sup>and</sup> <sup>forward</sup>, and <sup>so</sup> <sup>rapidly</sup> <sup>that</sup> <sup>it</sup> <sup>seemed</sup> <sup>to</sup> <sup>be</sup> <sup>true</sup> <sup>yellow</sup> <sup>circles</sup> <sup>as</sup> <sup>and</sup> <sup>turns</sup> <sup>before</sup> <sup>the</sup> <sup>bewildered</sup> <sup>eye</sup>, <sup>whirling</sup> <sup>the</sup> <sup>oranges</sup>, and <sup>there</sup>, <sup>as</sup> <sup>gravely</sup> <sup>eager</sup> <sup>and</sup> <sup>intent</sup> <sup>upon</sup> <sup>manoeuvre</sup>, <sup>their</sup> <sup>motion</sup> <sup>as</sup> <sup>though</sup> <sup>it</sup> <sup>was</sup> <sup>the</sup> <sup>weightiest</sup> <sup>concern</sup> <sup>of</sup> <sup>his</sup>, stood the grains who had given opera and cantata to the world, and who had touched the hearts of thousands by his wondrous invocation of wood and wire with a power such as has been vouchsafed to but few men.

An exclamation from the astonished spectator at length broke the spell the oranges descended to the floor in an unpremeditated <sup>grouping</sup>, and the musician turned in some confusion to shammer out a prelude to the witness of his feat <sup>in</sup> <sup>legardewain</sup>. Feeling that an explanation of the scene was expected and to some extent necessary, he promptly volunteered it in these terms:

‘There is nothing which, once thoroughly learned, is ever entirely forgotten, and nothing is ever learned uselessly, provided that it be not in itself immoral or prejudicial to the individual or the community. Put anything, carefully away, they say of material objects, and you will be sure to find a use for it before seven years are over. It is just the same with every mental acquisition. True, our time may be put out at better interest in some pursuits than in others, and it is very likely that the hours which I devoted to these “monkey tricks,” as my parents and other guardians not unjustly termed them, when I was a

boy, might have been more profitably employed; but they have served their turn nevertheless. At school, I was an adept in amateur jugglery; and I believe that it was to the perfect independence yet harmony of the two hands, which such a *tour de force* as this one that you surprised me in the execution of engendered, that I owe the ease with which I mastered, almost at the outset of my musical education, certain compositions which are marked by difficult inequalities of time, and which usually constitute a great stumbling block, not only to beginners, but often to more mature performers—such, for instance, as the concluding, “Vivace” movement of Beethoven’s Sonata in G, Op. 79. More than that, it stands me in good stead even now. After a long night’s work, as this has been, when I have been writing music for many hours by an artificial light, all earth, sea, and air seem to me with five puffed lips, and I beg <sup>of</sup> <sup>the</sup> <sup>men</sup>, not as true, but as <sup>eloquent</sup> <sup>in</sup> <sup>quaver</sup> <sup>in</sup> <sup>asking</sup>. Then I take up my three oranges for a few minutes, and the rapid and incessant shifting of the eyes from one to the other brings relief and renovation to the eye strained by monotony. Play properly chosen should in its kind be an assistance to, not merely a relaxation from, work.’

And indeed we find this principle exemplified not only in the private instructions of many great men which have been made known to us, but in the teaching of some of the most straightforward and outspoken of them. On the first of October several years ago, two eminent surgeons were delivering the introductory address to the students at the opening of the medical schools attached to the respective hospitals in London for the winter session. One advised his hearers to cultivate some mechanical art, such as wood carving or turning, or to habituate themselves to the use of carpenter’s tools as much as possible, in order that they might acquire a dexterous and pliant readiness of hand—a tactical instrument, as he termed it—which should assist them to become skilful operators. The other bade them devote their leisure moments to the assiduous practice of some manual instrument with the same object. While, by a curious coincidence, a celebrated physician in Scotland was at the same moment counselling his youthful auditors to pursue the study of music, not only as a healthful change from their graver labour, but in order that the ear might be educated to the delicacy of perception which would be of great service to them in consultation with the stethoscope.

A renowned philosopher not long dead is said to have delighted in conjuring tricks, and to have declared that he could gauge a stranger’s character better by the manner in which he took or refused a “forced” card, than by an hour’s conversation with him, and in a sort of corollary, and at the same time a converse to this, it may be noted that premeditation—who are of necessity close

observers of human nature—certainly seldom invariably to select without hesitation those who are best fitted to serve their ends without suspicion, from amongst an audience whom they have never seen before.

There can be no doubt that many of the minor details of work can be acquired or developed in sport, this play may be the forerunner of bettered work. Nor is this to be considered a mere psychical comment, when we remember that in perfection of minor detail is summed up nine tenths of excellence in art. Genius, or rather what is frequently called genius, is only the result of indefatigable perseverance and attention to the lowest mechanical complements. What painter could hope to reach the pinnacle of success who did not understand the process of properly mixing his colours?—a process no more artistic in itself than that of a baker who compounds a loaf. What man has he attained to eminence who has not understood the drudgery of the scales, or plodded through the dry-as-dust mysticism of thorough law and counterpoint? Above all, where is the poet who knows not Lindley Murray? Wholly says that words are pre-requisites of thought, Dr. Anger goes further, and affirms that 'the thoughts we cannot express are properly not yet ours.'

Being, then, that in play may be laid the actual foundation of what is more to be relied upon than genius, and without which genius itself is impotent, it behooves us to direct the pursuit of those over whom we have any control into such grooves as will be conducive to the greatest benefit in after years. Some natural bent or aptitude may occasionally be indicated, and taken as a guide, but as a rule, a healthy mind may be trained to success in anything, if followed up in the one direction, just as a healthy body will excel in perfect gymnastics, pugilism, swimming, wrestling, or acrobatics, according to its education.

## FOR HIMSELF ALONE

A TALE OF REVERSED IDENTITY

BY F. W. SPENCER

### CHAPTER V.

THE sound of footsteps put an end to Frobenius's musings. He looked up, and next moment a glad light leaped into his eyes. Edna Deane was coming towards him, but she held her breath as low that he could not tell whether she had seen him. He rose and went to meet her. 'Truant! where have you been all this time?' he said. 'I have not seen you since'—

'Since half-past seven this morning, and it is now exactly eleven,' answered Mrs. Deane demurely. 'Three hours and a half—a long time, truly.'

'It seems like three days and a half to me.'

'You might have seen me at breakfast, had you cared to do so.'

'I was very busy, so took breakfast in my own room. But you look warm, no doubt. Have you been chasing a butterfly, or merely robbing the roses of some of their tints?'

'Captain Dymon and I have been flirting on the croquet lawn. Are you not jealous?'

'Not in the least.'

'That must be because you are afraid of him. He is a most terrible fellow—by his own account shot no fewer than thirteen tigers when in India.'

'And all of them with the long bow, I make no doubt. But what have you in the basket of yours? Something in connection with some charity, I suppose?'

'No. I'm only hesitating a couple of duffers for the housekeeper. Getting my hand in, you know.'

'Getting your hand in?'

'Yes, and at the time you and I are married I shall have all this sort of thing to do then, and I may as well begin to practice in time. I went into the kitchen the other day, and the cook taught me how to make an apple dumpling. Are you fond of apple dumplings?'

'Very. At least I should be, if they were made by you.'

'The sole you had at dinner yesterday was fried by me.'

'Is it the sweetest sole I ever tasted?'

'I gave the cook five shillings, and she let me fry it all by myself.'

'Very kind of the cook.'

'I usually Sawyer for an hour every morning.'

'You will be quite a little treasure of a housekeeper.'

'I've a great deal to learn. I shall not be able to afford a servant, shall I?'

'Hum—well, only a small one, at first, perhaps. Now I come to think of it, Edna, there seems something mean and cowardly in dragging a girl like you down to the level of my poverty-stricken life.'

'Dick, I won't listen to you, if you talk such nonsense.'

'Your life has been one of ease, of luxury almost. You have never known the want of money. Have you fully weighed the consequences of tying yourself for life to a man who hasn't a ten pound note in the world to call his own?'

'Well, of course I have, you great goose!'

'And the ink does not frighten you?'

'Not the least bit in the world.'

'By marrying without your mother's consent, you will lose the eight thousand pounds which would otherwise come to you under your grandmother's will. Mr. Fitzworth will never consent to your marrying me.'

'What then? I love you better—far better than the eight thousand pounds.'

'I can offer you no better home than three or four dingy rooms in a back street in London.'

'So long as it is our home, I shall be content.'

'No more carriage drives, but the trolleybus has moved, no more servants to wait upon you, no flower shows, no operas, no picnics.'

'Other people live without such things, and are content. Why not I?'

'My brave-hearted girl!'

'Think how cosy we shall be, Dick, on winter evenings in our little home! And when we choose to go out, no cars, no responsibilities, but just the ketchup in your pocket, and there you

are. And on Saturday nights we shall have to go to market, you and I, with a big basket and a bulky umbrella, and bring home the butter and the eggs, and the asparagus and the truffles, and I shall have to be very careful that the shopkeepers do not overcharge me.

'Asparagus and truffles on three guineas a week, which will be about the extent of my income! We should be ruined in a month.'

'I should have aul cabbages and turneps. And then in summer, our window will shall be so full of flowers as it will hold, and that shall be our garden. And of an evening, when you have done within, you shall sit by the open window with your shppers and your pipe—I shall allow you to smoke, you know—and read bits of Tennyson to me, or a chapter out of the last novel, while I darn your gloves or sew on your buttons. And when it gets too dark to see to read or sew, but not dark enough to light the lamp—for we must be very economical—I will sing to you one or two of those songs that you say you love so well, and we shall be as happy, Dick, dear, as two robins in a nest.'

Her eyes were glowing, the delicate colour in her cheeks had deepened while she was speaking. Can it be wondered if Master Frank stooped and kissed the face that was gazing up so confidently into his? In any case, his vanity completely won to strive, that is what he felt.

'Yes! Dick, naughty boy! what right have you to tickle such liberties?' she said with a pretty pout.

'The temptation was too much for me.'

'I hope voices,' exclaimed Miss Deane, 'Clarence and Captain Dyson are coming this way. Let us turn down here.'

They took a winding path through the shrubbery that led to another part of the grounds, and were presently lost to view.

From the foregoing conversation, it will at once be understood that our friend Mr Frobisher had not succeeded in making his way while the sun shone. When he had made up his mind that he was in love with Miss Deane—and he did not take him long to arrive at that conclusion—he set once set to work with his customary ardour to achieve success in a pursuit that was utterly new and strange to him. But his victory had not been a difficult one, for, truth to tell, Miss Deane was quite as deeply in love with him as he was with her. When he had taken her hand one day and whispered certain words in her ear, she hung her head for a few moments, then looking up, her eyes dimmed with tears, and a little half-patetic smile playing round her lips, she had said simply 'If you value my love as much as you say, it is all yours.'

And thus the affair was settled between them, only for the present the sweet secret was all their own, for a little while no one must know it but themselves.

Scarcely were Frobisher and Miss Deane lost to view, when Captain Dyson and Miss Felworth appeared on the scene. Clarence was hanging on the little warrior's arm, and appeared to be intensely interested in what he was saying. His shrill piping voice could be heard while he was still some distance away.

'There I was, Miss Felworth,' he was saying,

'perched in a mangrove tree, on one side of me the tiger, on the other the tigress—waiting.'

'O Captain Dyson, what a frightful predicament!'

'Then instinct told them that in time I must succumb to hunger and fatigue, and then'—

'You quite make me tremble. Let us sit down here in the shade, please.'

'By all means. I am flattered by your interest.'

'But why did you not shoot the wretches?' asked Clarence, as Dyson sat down in close proximity to her.

'Mrs Felworth, I had only one bullet left,' replied the Captain, with his most tragic air.

'I should have died at night—I know I should.'

'What was to be done? Death—a horrible death—stared me in the face. Suddenly, a happy thought struck me. I was groping absently in my pockets, when all at once my fingers encountered a hard substance. What do you think it was?'

'Gracious me! Another bullet, perhaps?'

'No, Miss Felworth, it was not a bullet. It was a nutmeg.'

'A nutmeg, Captain Dyson? How very remarkable.'

'It was more than remarkable—it was providential. The moment I hit the nutmeg, I knew I was saved. I loaded my rifle with it, in place of an ordinary bullet, and fired. I am a dead-shot, and my usual skill did not fail me. The nutmeg entered the animal's left eye and crashed through his brain. One of my enemies was disposed of.'

'How very brave! How exceedingly clever!'

'I loaded my gun with the real bullet, and ten seconds later the wretched lay motionless in the dust. The skins of the two animals are on my library floor at the present moment.'

'What a wonderful exploit! I could listen to you all day long,' said Clarence as she rose and put up her umbrella.

'You do indeed flatter me, Miss Felworth.'

'You will tell me some more of your remarkable adventures, Captain Dyson, will you not?'

'I shall only be too gratified to do so.'

'For the present, I must leave you. Mamma will be looking for me.' She lit her square-tipped hat, for a couple of minutes, and most moment was tapping lightly across the lawn towards the house.

The Captain followed her with admiring glances. 'A most superior girl,' he muttered to himself, 'and so very appreciative.' Then he lit a cigarette, and strolled back in the direction of the croquet ground.

#### CHAPTER VI

In a cool morning room which Mr Felworth had appropriated to his own use, that gentleman and Mr Jack Drummond, whom he still looked upon as his nephew, were closeted together. Mr Felworth had a little business in hand which he was anxious to bring to an auspicious conclusion. 'Dumphy has agreed to invest a couple of thousand,' he was saying, 'and Dyson fourteen or fifteen hundred. I suppose, my dear Frank, I may put you down for the same amount as our friend the Captain.'

'In matters of this kind, as I have told you before, I am the veriest infant. If you tell me that the speculation is a sound one, I have no objection to invest.'

'As sound as a pound.'

'No fear of its creaking up in a month or two!'

'My dear Frank! As if I shall ask you to associate yourself with any speculation that was not absolutely *sound*! The Patent Bottled Orange Company offers a magnificent field for enterprising capitalists. Fifteen per cent per annum guaranteed, and a bonus every six months. Think of that! Fifteen per cent and a bonus!'

'Why, I shall be a millionaire before I know where I am. You shall have a cheque in the course of a few days.'

'Bless you—bless you! I suppose I can lock up the coupons in my finger of silk along with the other documents I hold belonging to you!'

'No no. They will be safer in your keeping than in mine.'

'My own idea, exactly—By the by, my dear Frank, I hope you won't think it impudent on my part, but may I ask whether Mr Drummond's story is Waylands as likely to be a very lengthy one?'

'That depends up on himself. I want him to stay here all winter—to make Waylands his home, in fact. But he is so very independent. He talks about going back to his books and packets in our old rooms in St. John's.'

'A very sensible young man. He would feel him off too much like a dependent here. In any case, my dear Frank, it seems hardly advisable that the intimacy between yourself and him should be kept up on the same familiar footing as of old.'

'I don't know so much about that, my dear Frank. You see, we were chums together all through those old poverty-stricken days that now seem so hard to believe in. When a man has shared his life's experience with you—when you have dined together off my penny slice of cold meat and a pint of porter, when you have walked the streets together for hours after dark, become your own as well as you couldn't be seen out by daylight, why, if fortune ever does turn up the ace of trumps, that man is the first whom one ought to remember. Don't you agree with me, Uncle Peabworth?'

'Certainly, my dear Frank, certainly! Great friendship is always beautiful. I am glad for many things.'

'So that you see,' continued Drummond, 'Dick and I are almost like brothers, and if he leaves Waylands, I shall miss him more than I could say. He attends to my letters and accounts and all sorts of bothersome things. I never could answer letters, you know.'

'My dear Frank, why not take me for your guide, philosopher, and friend, unworthy me! Mr Drummond cannot claim to have that experience of the world that I have, he cannot claim to have that interest in your welfare that I, your uncle on your poor dear mother's side, have. No, no. Ask anybody, everybody, they will all say "Peabworth's heart is in the right place." That heart, my dear nephew, I need hardly say, is entirely devoted to your welfare.'

'Very kind of you, I must say. Somehow,

nowadays, I seem to have no end of friends. Everybody seems to like me. Once on a time, poor old Dick was the only friend I had in the world.'

'Mr Peabworth shook his head in grave dissent. 'You noble heart, Frank, a noble heart! You fixate in whatever passion of life you might be placed in.'

At this moment a servant entered with a card on a silver dish. Dick took it and read: 'The Hon. Mrs. (Drummond)'. 'I don't know her. Never heard the name before,' he added.

'One of the most notorious leaguers in these parts,' observed Mr Peabworth meditatively.

'A leaguer, uncle?'

'I mean for so-called charitable objects. Be wary of her, Frank, or she will whittle your purse out of your pocket before you know what you are about.'

'In any case, I suppose I must go and see the woman, answer her, and with that he rose and left the room.'

Mr Peabworth looked after him with a queer 'A gilded puppet' no matter to himself. 'But I must have the pull, of the thing, not Mr Drummond! A diversion will be that. He must be got out of my Waylands at any cost. He is a son of his father through his hands, turned his hands deep in his pockets, and began to put the room slowly. 'I'll take again, he said. 'The cheque which Frank will give me will just pull me through my difficulties with St. John's and so. He will never ask to see that up as if I can only be trusted to take care of the next three months, I shall be distressed. He pulled heavily, wiped his hot palms with his handkerchief, and stood for a few moments, springing absently at the gasp in his mind. While he was thus engaged, a robust man came slowly along the terrace. At sight of him, Mr Peabworth started. 'Ah! Mr. Andrew, he called out. 'You are the very person who was in my thoughts.'

'Kind of you, I'm sure, my friend Frank. I like people to think about me.'

'If you have a few minutes to spare, I should like to have a little conversation with you.'

'I am entirely at your service, Mr Peabworth.'

The other man led the way into the room, and closed the door behind him. 'Pray, take a chair, Mr Drummond.'

Frank took one, and Mr Peabworth sat down on the opposite side of the table.

'I have just had a long talk with my nephew, and the latter, among other things, he remarked that it was your intention to leave Waylands in the course of a few days, and resume your old mode of life in London. I quite regret it.'

'And did he simply remark that, or did he say that?'

'And did you really believe it?'

'Likely.'

'My dear sir, I gave you credit for having a higher opinion of me than that.'

'Upon my word, Mr Drummond, I hardly follow you.'

'I appeal to you, Mr Peabworth, as a man of the world. Should I not be a very intimate acquaintance with my friend at the very moment he has stepped into what is called the world? It would be so much to expect of poor human nature, would it not?'

'Likely.'

'My dear sir, I gave you credit for having a higher opinion of me than that.'

'Upon my word, Mr Drummond, I hardly follow you.'

'I appeal to you, Mr Peabworth, as a man of the world. Should I not be a very intimate acquaintance with my friend at the very moment he has stepped into what is called the world? It would be so much to expect of poor human nature, would it not?'

'Poor human nature is weak, very,' answered Polworth with a melancholy shake of the head, but with his cunning eyes fixed anxiously on Froisher's face.

'And as regards dear old Frank,' went on the other, 'never were the sweet offices of friend ship more needed by him than at the present moment.'

'I confess that I fail to apprehend your meaning.'

'When Frank was poor, Frank could take care of himself, now that Frank is rich, Frank must be taken care of. He must be protected from the horde of hucksters and bloodsuckers who scent out a rich man as unhesitatingly as though he were a penguin, and they so many knives bent on picking his bones.'

Mr Polworth moved uneasily on his chair. 'And you have constituted yourself my nephew's protector?' he asked with a half hidden sneer.

'I have constituted myself his protector, his adviser, and in all business matters his other self, or as we say in Latin, his alter ego. For the present, Waylands is my home, and here I mean to stay—as long as it suits me, and no longer.'

'Upon my word, sir, you assume a very independent tone in this matter.'

'And not without reason—listen to me, Mr Polworth. My friend informed me not many minutes ago that you had persuaded him to invest heavily in Patent Osoms.'

Mr Polworth half started from his chair, and then sat down again.

'Three weeks ago,' continued Froisher importunately, 'at your suggestion he invested one thousand pounds in Pan Caucasian Mining shares, and you have been quickly forthcoming with him as regards the African Band Utilization Company.'

'And pray, sir, in what way may all this concern you?'

'Whatever concerns my friend—or his pocket, concerns me. Now, I have only to go to Froisher and lay before him a few plain facts—I have only to tell him that the Pan Caucasian shares have been going down slowly but surely for the last seven days—'

'A temporary pause, nothing more.'

'So be it. I have only to tell him that there are some very ugly rumours afloat with regard to the stability of the Patent Osoms Company.'

'Calumnies, base calumnies, every one!'

'So be it. I have only to tell him that the list of the Directors of the African Band Company does not contain a name of any standing in the City—I have only to do that, Mr Polworth, and my friend would come to you five minutes later with instructions to sell out without an hour's delay every share, worth of stock you have bought in his name.'

The pallor on Mr Polworth's face had deepened as Froisher's cold unimpassioned tones touched on one point after another, surprise and anger had gradually given place to abject fear, for the time being the man looked ten years older than he had looked ten minutes previously. He took out his pocket-handkerchief furtively and rubbed his damp fingers with it under the table. Once, twice, he ceased to speak; but no sound came

from his lips—Froisher was quietly rolling a cigarette.

'But you are not going to say anything of the kind? I say dear Frank, are you, Mr Drummond?' The question had something of the sound of a beggar's winning entreaty.

Froisher looked up with a contemptuous smile. 'Why should I not, Mr Polworth?—why should I not?' he asked. 'And then, again, why should I?' he added a moment later. 'I only speak of these things to prove to you how desirable it is that you and I should be friends.' He leaned his elbows on the table and looked steadily into the other man's face. 'Don't you think, Mr Polworth, that you and I had better be friends than enemies?' he asked.

Mr Polworth's eyes quailed and fell. He drummed nervously for a moment or two with his fingers on the table, then he said, 'I know of no reason, Mr Drummond, why you and I should not be friends—the best of friends.'

'Good,' replied Froisher. Then he finished the preparation of his cigarette before uttering another word. 'Do you know, Mr Polworth,' he resumed, 'that it has often occurred to me how badly you were treated by the late Mr Askew, when he bequeathed every penny he died possessed of to his scrupulous nephew, and left you, his first cousin, entirely out in the cold?'

Mr Polworth stared, as well he might, but the impressive face opposite told him nothing. After a little pause of hesitation, he said, 'I was badly treated, Mr Drummond—very badly treated. The forgetfulness, the unkindness, of my aged relative, for whom I always cherished a very warm affection, he, I must hardly say, touched me to the quick.'

'If old Askew had only left you a slice of the pudding! If, for instance, he had left you the Murebald property, in York-hire, which brings in something like two thousand a year—how very nice that would have been!'

'Don't, my dear friend—please, don't! Even to hear such a thing hinted at is almost too much for my poor feelings.'

'How many romances one hears and reads about—how many strange freaks of fortune that are in connection with wills! I would be a curious circumstantialist, now, wouldn't it, if some fine day a freak will wait to turn up showing that Mr Askew had not forgotten you at the last moment?'

'Don't talk in that way, my dear sir, please, don't!'

'I absolutely beg given me something like a cart load of old Mr Askew's papers. I wade through what, if among those papers I should come across a will the contents of which has hitherto been unknown, and in which your name is not forgotten—it would be a remarkable coincidence, would it not?'

Polworth turned first red and then yellow, and stared at Froisher, as if in doubt whether to take his words seriously or the contrary. 'It would indeed be a remarkable coincidence, Mr Drummond,' he said at last. His voice trembled a little, and his eyes were bent with a furtive and suspicious look on Froisher's face.

'Fifteen hundred or two thousand a year derivable from landed property would not be so bady—eh, Mr Polworth?'

'Ah' It was a sigh rather than an exclamation, but it was eloquent with a meaning all its own.

For a little while, neither of the men spoke. The fish was playing round the bait. The angler was waiting patiently.

'Do you think, Mr Drummond, that there is the slightest probability of my such will as you hunt at being in evidence?' Mr Peabworth's voice was hardly raised above a whisper, and he had glanced warily round before speaking, to make sure that they were alone.

'At present, I have only waded through about one third of the old gentleman's papers, Mr Frank. What may be hidden among the remainder, I cannot of course say. But—nothing is impossible.'

'The law would not get anything out of the ordinary in such a document.'

'How could it? You were Mr Ash's first cousin. What more natural than that he should have changed his mind in your favour, still making his first will? Doubtless he would still have six thousand a year. A man may live very comfortably on six thousand a year.'

'What if my dear Frank were to contest the will?'

'You don't know poor, dear, simple-hearted Frank as well as I do, or you would not even hint at such a thing.'

'The witnesses to such a document would be—'

'Softly, my dear Mr—' 'No document of any kind has yet been found, and the chances are ten thousand to one that it never will be found. Still—my reasons are things that do happen every day of our lives.'

Peabworth rose and pushed back his chair. Frank was anxious and perturbed, and yet not without an inward feeling of elation. The golden but dangerous before his eyes had proved too much for his powers of resistance. He had sneaked at it, and was hooked without as yet being aware of the painful fact.

Peabworth had in hand turned to say a few last words. 'In this mercenary age, Mr Peabworth,' he said, 'men do not usually care to labour for nothing, and when they do, their work as a rule is worth but little. As a man of business, it must naturally occur to you to ask yourself what object I have in view, what end I wish to gain, in speaking to you as I have spoken this morning.'

Mr Peabworth nodded. The question was out that he had not failed to ask him.

'I can tell you in a few words the object I have in view, the end I wish to gain, answered Frank. 'I am in love with your niece, Miss Drake, and I want your consent to our marriage.'

'You want to marry my niece? You?'

'Even I? Why not, Mr Peabworth? It is true that at present I am only Dick Drummond, a poor painter, but I don't want to remain a poor painter all my life. I could marry Miss Drake without your consent, were I so minded, but in that case, she would forfeit the eight thousand pounds which comes to her under her grandfather's will. Now, although I am a Bohemian, I am a very much of an individual as well, and I should be a fool to miss the chance of making

eight thousand pounds. Then again, by marrying your niece, I should become your nephew, in which case, don't you see, your interests and mine would be identical.'

'You need give me time to think—to think, Mr Drummond,' said Peabworth, who was utterly taken aback by the audacity of Frank's avowal.

'As for that, we are only the usual, you know, and the chances are that our talk this morning will end in nothing, but moonshine. But so long as you and I understand each other, that is enough. And I think I may say, Mr Peabworth, that we do understand each other.'

'We do indeed, Mr Drummond.'

'We will talk further of this anon, as they say on the stage. And now for a cigarette on the terrace—Listen to that blackbird, Mr Peabworth. How sweet its note, how pure its song! I think that I should like to be a blackbird on a bright morning, in summer.' And with a smile, whose meaning Peabworth could not fathom, and a case-knife, Froisher lying slowly through the open window and strolled along the terrace.

'What a remarkable young man—what a very remarkable young man!' muttered Peabworth to himself as he gazed after Frank's retreating form. 'He may be a painter of pictures, which he cannot tell, but if so, he has certainly not till now been in life. He ought to be managing the firm of the African and Indian Company. He is the very man for the post.'

## 'A MEDICAL GUIDE FOR ANGLO INDIANS'

We have just met with a little book bearing this title, written by Dr Muir, and published by Messrs Paul and Co, London. What would we not have given years ago, when in the wilds of the Indian districts, to have had some such Guide to help us! One of our party had been stricken down with malarious fever. We were miles from any English doctor, who, even by hard travelling, could not have reached us under twenty-four hours. We were compelled to fill back upon the nearest native apothecary, whose prescriptions only made matters worse. We were compelled finally to break up camp and carry our invalid into the station.

Turning to the chapter on 'Fever' in Dr Muir's book, we are at once put in possession of the varying symptoms and how to meet and master them. Had we had such a Guide at the time of which we speak, it is not too much to say that it would have saved us from grave consequences. The prescriptions given can be understood by a child, and the quantities are all written out in plain words, such as, for example, Take of Quinine, two scruples, Diluted sulphuric Acid, one dram (or the juice of one lime). Any one, therefore, furnished as most Indian travellers are, with a small medicine chest, can make up their own medicines with the assistance of this excellent help. We further add, it affords an agreeable means to recur in spite of all treatment, the only course left us for the patient to quit the malarious district—if his health has been much

damaged—for some more salubrious locality, or to take a sea voyage.' But then, Dr Men knows that many circumstances combine to prevent the Indian civilian or officer from moving about at will, so he adds, 'When this is impracticable, persons exposed to a malarious atmosphere, or who have had an attack of fever, would find it worth their while to attend to the following cautions. First, beware of sudden exposure to cold, and of damp or wet feet. Second, avoid over fatigue and exhaustion, however produced. Third, never sleep in the open air during the night, and never close to the surface of the ground. Fourth, go early to bed, but do not get out of doors too early in the morning. Fifth, never leave the house in the morning with an empty stomach. Sixth, be temperate in habits.'

As much of the Anglo-Indian life is spent under canvas, how necessary is it to have some knowledge of how to treat and better still of how to avoid the majority of the climate upon English constitution. It is quite possible, with care, to enjoy as good health in India as in England, as many who have returned after thirty or even forty years' residence there can testify. As Dr Men remarks, 'Medical men of any experience in India know full well that even at the present day, in a very large, if not in the greater number of cases, men whose constitutions have been so impaired as to necessitate a return to their native country, should assign the cause to their own imprudence and want of self-restraint, rather than to any direct influence of the climate.'

By this Dr Men does not deny that the climate has no influence on the constitution, for it is a very important factor in maintaining health, if people do not take the precaution of having periodical change. Given the case of a man who could not live the country at all, Dr Men says, 'his children in a rule would be field in mind and body, and the prospects of another generation would be remote.'

The object and use of this *Guide*, therefore, is to help those who are residents, or about to become so, with suitable hints as to how to preserve their health. He recommends that the health should be well established in young people before they are sent out to India, because 'very young men, youths under twenty years of age, are less able to encounter the climate of the plains than those above twenty and under thirty. They are generally less able to resist the influence of the continued high temperature, become during their first hot season predisposed to attacks of fever, dysentery, diarrhoea, cholera, or heat apoplexy, are more likely to fall victims to epidemic disease, and are not unfrequently so enervated and debilitated as to be obliged to leave the country before they have completed two or three years' residence.'

This is practically tested every year among the boy soldiers of regiments newly arrived in India,

or the new recruits who are sent out to fill up vacancies. Men should not be sent out to India until they have passed their twentieth year, and girls their eighteenth. It is equally a risk to go out for the first time after one has passed the age of forty.

Another caution Dr Men gives is one that cannot be too much insisted upon. Has it not passed into a proverb, 'the one year more' that men return, which often proves their last? Tempted by adding a little more to their fortune or their pension, they remain beyond the time when health can bear, and so lose it. To many, India is a *matutuum* rather than *otium*. Those who are consumptive or agonal, often enjoy better health out there than in England.

We were speaking just now of imprudence and want of self-restraint being the root of much ill health in India. This may be accounted for by the style of living, which tempts the appetite with all sorts of rich food. As a rule, people in India eat more than they can digest, and this is the secret of half their liver complaints. 'First of all,' says Dr Men, 'there is the little breakfast, *chole kharri*, at six in the morning, which consists of tea or coffee and bread—with or without eggs—and fruit. Second, breakfast at nine or ten o'clock, composed of curries and rice, chaps, cold meats, fresh eggs, with bread, tea, coffee, or claret. Third, dinner at two or three, consisting of a joint of mutton, mutton and rice pudding, and fruit. Fourth, dinner at seven or eight P.M., consisting of any number of courses, according to your position and your pocket. I will question the fact we have stated, after reading this, that as a rule people in India eat more than they should. Dr Men enters very judiciously into the question of consumption of food, which those who are interested in the matter would do well to consult. He declares emphatically that 'the daily survival of millions in India requires no alcohol, liqueurs, whiskeys, if he comes to India as he ought to do—full of life, vigour, and energy. If he does require stimulants, he has certainly made a mistake in going out to India at all. The idea that beer, wine, brandy, or other alcoholic stimulant, is necessary to counteract, as is fancied, the depressing effects of the climate, is a delusion, and too often a snare. It is the rock on which more lives have been sacrificed than from any other cause.' In this opinion Dr Men is supported by all the best medical authorities in India.

The questions of food, drink, sleep, exercise, bathing, smoking, and the like, are all fully treated, with sound judgment, and well advised upon. There are most valuable chapters on the management of children in India, which we strongly recommend to mothers. Indeed, we feel sure that any one having children or friends in India, and those whose lives are spent there, will thank us for drawing their attention to this most useful little book, written by one who has from long residence in India proved the truth of all that he has advised. It will help the anxious wife or husband how to act when far from medical assistance. The young mother, ignorant what to do in an emergency, will find its directions ample. Indian complaints of every description,

Gunnery showed its unshaken hold on the affections of the people, which it gave a visual example of that inviolable vengeance on the traitor which even his death could not atone.

## 44

Much about the same period was committed a crime which caused great excitement among the English residents at Naples, as it was the first belonged to that community. It was a most heinous one, leading a married life, and his only crime was that, by his cultivation and sale of flowers, he interfered with the monopoly of the market enjoyed by the church of the district. For this, he was murdered on a balcony in his own garden, a signal warning to all possessors of the privileges of the society.

The next outing, we shall refer to occurred in the winter of 1872-73, and in this case also the sufferer was an Englishman. He was a doctor in general practice, and lived, with his wife and a very large family of children, in a handsome palace near the Champs. One day, to his dismay, he received a letter from him with some question unless he consented to pay the sum of a thousand francs, in order to secure peace, and deliver him from a painful war, to be called for in the post office. He lost this money at once before the authorities, who obliged him to send the money by direct, while he himself should be detained in the post office to assist the person who had been in this case, however, which has often been adopted with success in similar cases, he declined, for as tantamount, to follow, requesting instead that a personal guard should be assigned to himself. The guard was given, and four months' need was met in his house while he was waiting, and at last heard from that the doctor was being walked around. But the persistence of his enemies was not to be so easily balked, and one day, as he was passing through a crowded thoroughfare with two municipal guards before, and two behind him, a man, in disguise, by him, fired into his chest at point-blank range, and, if we do not take any risk, we will kill one of your children.

The fearful night was enough for the poor doctor, who, watching him, made all preparations for flight, and giving his wife twelve hours to pack, probably cost his life by getting Naples that night with all his household and belongings.

The systematic and daring character of these outrages proves them to be the acts of the Communists, and though they are only a few instances gleaned at haphazard among a host of similar cases, they suffice to show that the all-potential society is still rampant in Naples, despite the efforts of Government to eradicate it. It is also a fact that stolen property is frequently recovered by entering the agency of the chief of the Camorra (the *boss*), correspondent, writing on September 6, 1940, mentions the state of things with other proofs of the insecurity of property in Naples, and that robbery can be carried by an established trust to inflict any degree of personal injury on an enemy, from a shilleto between the ribs to a sound thrashing. The extremely low charge—only ten francs—for the latter form of punishment makes it a favourite mode of settling minor irritivities, for which remuneration of personal disfigurement might even be demanded to secure a penalty.

What, then, is the nature and history of this mysterious body, so formidable, and yet so dear to the popular imagination of Naples? Of Marc Monnier's pages supply a full and sufficient answer, for while the Camera has to some extent modified the details of its organization to suit altered circumstances, its mode of operation, though somewhat more disguised, is practically the same as in its infancy days before the Revolution.

Now, as then, the Camera's members are personifications of power and honour to the Neapolitan of the lower classes, and the attainment of similar honours and distinction is the utmost goal of the ambition of the young gentlemen. Indifference to suffering and danger has ever been the first requisite for success in the career, and to justify the use of violence our author declares him is subjected to, the young aspirant must often have found the path to glory a thorny one. A duel with the knife was the lot of those credulous, and he was liable to be put through others still more formidable. A five-year piece, for instance, was placed on the ground in the centre of a ring of spectators, who all tried to transfer it with their knives, and the novice on trial, in the attempt to catch the knife from amidst the glancing blades, often purchased his promotion at the cost of a pierced and bleeding hand.

Having passed some such trial of valour, he became a *giornato de agio*, which may be freely translated 'bully boy,' agrees in Italian meaning, 'to leave,' and *agorista*, 'a law-suit.' The neophyte had then an arduous probation before him, being made over as a sort of fighting specimen to a full Cameraist, for whom he was expected to perform the most difficult and dangerous tasks. Thus novitiate might last for many years, unless the disciple had the much desired opportunity of absconding it, by the performance of some signal act of devotion to the society, such as committing a murder on its behalf, and these occasions of distinction were so carefully sought for by the juniors, that they had to be disposed of by lot. Or he might earn his way by accepting the responsibility and penalty of a crime committed by a senior member, a form of self-sacrifice called *accettare un delitto*, and, strange to say, by no means uncommon in the ranks of the society. Thus one of the *scudi*, Filippo Cillo, when in prison, conceived a grudge against the inspector for some trifling contradiction, and desired his death, which in enthusiastic probationers, one Zillocchio, undertook to effect. The Cameraist, who was about to be removed to another prison, bled him out for twenty-four hours after his departure before carrying out his design. His orders were practically attended to, and at the time fixed by him, his enemy was slain. Zillocchio arrested, tried, and found guilty of the crime, carried it out, and, without ever breaching the name of its real author, thus dying a martyr to his generous code of honour.

The *proscritto*, who either by long and faithful service, or by the performance of some striking act of heroism, thought himself entitled to promotion, made a formal application for admission into the inner ranks of the society, where his claims were debated in solemn council. If they

were found sufficient, he was initiated with a theatrical ceremony, in which a dagger, a pistol, and a glass of poisoned beverage played a part, and with his hand dipped in his own blood, the neophyte went through a sort of penitence, expressing his devotion to the society, even to the extent of committing suicide at its bidding. Presented then by the chief to the assembled brethren with the formula, '*Riconoscete l'uomo*,' the new Cameraist was invested with the full privileges of his order, entitled to take part in all its deliberations, and to share in the division of its spoils.

The twelve districts of Naples had each its separate branch of the society, acting independently of the others, under its local chief. The latter functionary was assisted in his administrative labours by secretary and accountant, or cashier, whose duty was the equitable distribution of the *desistio*, or weekly revenues of the branch, divided every Sunday morning, among the assembled members. This fund, which must have been very considerable, was principally the product of a little regularly assessed on the profits of all forms of traffic, lawful and contraband, honest or dishonest. The gambler's winnings, the priests' fees, the miserable wages of the sempstresses, the huckster's pithy gains, were equally mulcted of their tenth by the ubiquitous agents of the Camera. But it must be admitted that if the society thus usurped the privileges of regularly constituted authority, it also exercised some of its functions, and the people paid the exactors willingly, because it provided efficient protection against those of others. The Cameraist intervened in all transactions, generally in the interests of justice, marked on fair play between the parties to every bargain, enforced a rough-and-ready order, where order besides that was none, and in quarters often acted as an amateur judge, whose arbitration was preferred by the people to that of the courts, more cautious, and probably not less impartial than that of the judicial tribunals. In the low haunts of obscure gambling, the silent man who looked on a passive spectator, and held out his hand to each winner for his tenth, saved the police the trouble of expatriating these centres of ignoble vice. The great monopoly of crime thus often acted as a check on its commission by poaching on its privileges, and the wolves constituted themselves the guardians of the flock against the depredations of other bands of prey.

It was in the Neapolitan prisons, where criminals were herded indiscriminately together, that the Camera had its origin and focus, no trace of its existence without their walls being found farther back than 1830, though an organization exactly similar existed in the Victoria prison as far back as 1878. Honorary gradations of rank were recognised among the respective associations of these dungeons, the prison of Castel Capuano being pre-eminent over the others in Naples, but in its turn subordinate to the *Bagno di Florida*. The respective *camorras* of prisons and prisons were, however, invested with no ordinate authority, and exercised no jurisdiction the one over the other. The convict once within the prison walls, was the absolute slave of the Camera, whose commands met him the moment he crossed the threshold with a demand for a

contribution for the 'oil of the Madonna,' a pious tax intended to keep a light burning before her shrine. Then followed a regular system of pillage. All the luxuries of prison life, wine, tobacco, and gaming, were in the hands of the Camorra, which licensed their use, and in order to enjoy these solaces, the wretched prisoner parted with his food, his clothes, his bed, so he would have parted with his own soul, had it been an equally negotiable commodity. Every game of cards, every hand at cups or bricola, paid its tithe, and while each player lost in succession, the Camorra steadily won. Thus, in the Vicaria prison, its gains from these sources amounted in one week alone to twelve hundred francs.

The maintenance of order within the prisons was almost entirely confided to the society, as deprived of its co-operation, the authorities would have been powerless. A prisoner in Cecel Capuano, a noted assassin, committed a serious breach of the prison discipline of . . . the . . .

**A TICKLISH SUBJECT**  
THOUGHT BLADING AND OTHER PERVOUSNESS

For, if not all of us have from time to time been spell bound at the recital of a ghost story, sometimes the shadowy thing has confronted the halcyon traveller at midnight on some unlighted road, sometimes the ghost has been encountered in his legitimate outdoor haunts, the churchyard, but more frequently the assumed apparition has been made acquainted with in the dark peaceful chamber of some of our mortal mansion.

On various occasions we have related 'ghost stories' in this paper which, unexplained, must have impressed our readers with the idea that the or the narrators were believers in what, in this connection, is termed the supernatural. But this is not so. We prefer, indeed, rather to relate even the most extraordinary occurrences to the laws, more or less occult, which govern everything that transpires in the world.

In the olden time, we confess to have been intrigued at many of the tales told to us by monks or madmen, and we confess to have found sensation still, whenever we hear of some unusual occurrence the reason of which included in mystery. The sensation, however, permitted to grow with our life, cannot be shed a healthy one, and ought to be removed and calmed down into pleasurable remembrance by every means at our disposal. Cut to the mystery, and ask the why and the wherefore. Why let the 'ghost' come and pay about an effort to 'lay' it!

In connection with derangement of the brain we have in former articles shown how the sufferer may see all sorts of things, and imagine all sorts of things, and we have striven to make the immediate and necessary connection that exists between the brain and all our actions.

The whole subject is invested with a weird kind of interest, when we are on his trial for his life, thought he saw a chance of gratifying his hatred,

by volunteering to be his executioner. The course of justice, however, debarred him of this last hope, for his enemy was acquitted. A dying Camorrist, in the closing stage of lung disease, lived in a neighbouring tavern of the Vicaria, a pot had been put at his expense. He would his knife, rushed to the spot, and slew the author of the insult, then returned home, and died in a few moments, in consequence of the exertion.

The Camorra in its war upon society respects nothing so much as warlike spirit in others, and has been known to reward with honorary membership those who successfully resisted its attacks. A Calabrian priest, when introduced into the prison of Cecel Capuano, refused, being himself penniless, to pay the usual fee for the 'Madrassa' lamp, and on being thus treated with a stick by the Camorrist collector, he told him he would not be so daring if he too had a weapon. 'That was not so difficult,' said the Camorrist, picked up the trunt, and running to the deposit of arms, which the priests do not visit, for fear of being arrested, but content in the care of their chiefs for concealment, he returned with two knives, one of which he presented to his antagonist. A duel ensued, in which the Calabrian killed his man—a result which filled him with terror, as he used to be it once a mark for the vengeance of the society and the justice of the law. Further, however, resistant his defence, on the contrary, the applause of the Camorra was expressed in the form of a bag of copper coins laid under his pillow that night, his share of the barstole or revenue of the society, thereafter paid to him weekly during his imprisonment, in recognition of his prowess.

A similar adventure occurred to another Calabrian, who, on leaving a prison where he had been running as balliant, was received by a man with a heavy stick, and summoned to

at the same place and hour, he was met by a mysterious individual, again with a stick, which, however, he presented not in menace, but in amity. 'Take this stick, Be thurs,' said he, 'which I have the honour to offer you, for your gallant victory yesterday evening.' The Calabrian found it in vain to refuse, he accepted this singular gift, and was then escorted frequently saluted in the streets as a Camorrist by people of whom he had no knowledge.

The most extraordinary piece in the history of the Camorra was its organization as a citizen guard in 1860, by the Prefect of Police, Don Lacerio Romano, then at his wit's end to preserve order in the city. The proclamation of a constitution by Francis II on the 26th of June, was followed by the opening of the prison, and the enlargement of schools of malfactor, whose first act was to attack the offices of the commissariat of police, burn the archives, and put to flight all the ordinary guardians of public safety. A frightful state of anarchy ensued, during which the sack of Naples by the mob of confederates seemed imminent, and war-horses were actually lured by the leaders for the courage of the expected booty. In these desperate circumstances, the extraordinary expedient was resorted to of

confiding, the guardianship of order to the Camorra society, formed into a municipal police, in which the *picciotti* formed the rank and file, and the adepts of the sect the officers. The strange experiment succeeded for a time, the risk of the city was averted, and order maintained for some months.

Among the incidents of this subjugation one recounted by M. Marc Monnier. A company of police, recognised by the mob, was protected from their fury by one of the new officers of public safety, and sent to his home by a noted Camorrist, Luigi Corradini, nicknamed *il Peruviano*, who indignantly refused the bribe offered him for the service, with the successful reply, 'Do you take me for one of the old *picciotti*?'.

After the entrance of Garibaldi on the 8th of September, the evils of this anomalous state of things developed with startling rapidity, and the Camorrist clubs took to smothering by hand and sea on so vast a scale as almost to annihilate the municipal revenue, twenty five scudi covering the entire customs receipts for one day! Enraged measure of repression became necessary, and the arrest of ninety Camorristas in one night of December 1860, was so efficient a remedy, that the duties the following day produced three thousand four hundred francs. But such was the popularity of the act in Naples, that when bigger blows sprang, Italian Ministers of Police, waged a deadly war against it, dissolving the citizen guard, and depositing a hundred of its members, the populace rose and expressed their displeasure in serious riots.

Since then, the Camorra has been reduced to operate in a more obscure fashion, interfering occasionally in elections, extracting money from Bourbonnais, under the plea of sheltering them from persecution, and so forth, in fact, to the stability of expenditure of ordinary smuggling. Still its hold on the minds of the people is still shaken, and the places of the leaders, especially arrested in batches of hundreds and fifties, are quickly supplied by fresh recruits, while the wives of those in prison receive all their husbands' privileges, and then very children, trained from infancy in the art of the knave in secret schools for this accomplishment, are early initiated with some of the terror of their fathers' names. But though the Neapolitan Camorra, like all traditional institutions in Italy, does hard, it must eventually disappear before the advance of civilisation.

#### NOTHING LIKE WORK

In all mining localities, the words of Nottingham worms for mining purposes are fully recognised, but only a comparatively few people are aware of the trouble that is expended upon them. This industry affords employment to a large number of persons throughout a considerable part of the year, who, every favourable night, collect the worms from their happy hunting grounds in the meadows. Naturally, the supply in wet weather is more abundant than when the atmosphere is dry, although some sort of a harvest can even then be obtained by watering the ground. The worms are provided with lanterns, and have to endure some consider-

able aplenty in catching their prey, as, if disturbed by any noise, they pop back into their holes. As soon as the worms are brought in from the country, they are taken to the 'farmers,' who place them in common sack-moss, and there they remain until they are as bright as a piece of malabar, which is a proof of their being in good order to be sold, as a freshly-caught worm is extremely tender, and breaks up readily when put on a hook. The worms are generally kept in moss from three or four days to a week, which is the longest period they can be preserved in good order. The worms are frequently packed over, in order to exclude all those that are broken and mucky, and when fit for use, they are usually sold for three halfpence or four shillings per thousand, packed up in canvas bags filled with moss for this purpose, only the plump and healthy worms are selected.

ed every Sunday morning, among the *picciotti* members. This fund, which must have been considerable, was principally the product of the regularly assessed on the profits of all sorts of traffic, lawful and contraband, honest and dishonest. The gambler's winnings, the *picciotti* the successful wages of the sempster, the huckster's petty gains, were equally fed of their tents by the ubiquitous *picciotti* of Camorra. But it must be admitted that the society thus warped the privilege of duly constituted authority, it also exercised its functions, and the people paid its tribute willingly, because it provided efficient protection against those of others. The Camorrist acted in all transactions, generally in the person of the law, invested on fair play between parties to every bargain, enforced a rough-and-ready order, where order besides there was none, and in general often acted as an umpire, whose arbitration was preferred by the plebeian, the lawyer, the more cautious, and badly not less impartial than that of the blue tabernacle. In the low haunts of obscurity, the silent men who looked on a passive spectator, and held out his hand to each winner, his watch, and the police the trouble of eradicating those roots of trouble was. The monopoly of crime thus often acted as a shield on its commission by purchase on its privacy, and the wolves constituted themselves the police of the flock against the depredations of their breed of prey.

It was in the Neapolitan prisons, where malefactors were packed indistinguishably together, the Camorra had its origin and focus, no sort of its existence without their walls being farther back than 1860, though an association of exactly similar existed in the Viaura as far back as 1872. Honorary graduates of rank were recognised among the respective associations of these dungeons, the prison of St. Capriano being pre-eminent over the others in Naples, but in its turn subordinate to the *San di Procula*. The respective Camorras of each and prisoners were, however, invested withordinate authority, and exercised no jurisdiction one over the other. The convict once within

## A TICKLISH SUBJECT

THOUGHT READING AND OTHER PSYCHIC PHENOMENA

Most, if not all of us have from time to time been spell bound at the recital of a 'ghost story.' Sometimes the shadowy thing has confronted the isolated traveller at midnight on some unfrequented road, sometimes the ghost has been encountered in his legitimate outdoor haunts, the churchyard, but more frequently the 'called' apparition has been with acquaintance with in the old panelled chamber of some old household mansion.

On various occasions we have related 'ghost stories' in this page which, unexplained, might have impressed our readers with the idea that we or the narrators were believers in what, in this connection, is termed the supernatural. But this is not so. We prefer, indeed, rather to reject even the most extraordinary occurrences to the light, more or less of cult, which govern everything that transpires in the world.

In the olden times, we confess to have been staggered at many of the tales told to us by nurse or maiden aunt, and we confess to a wild sensation still, whenever we hear of some unusual occurrence the reason of which is shrouded in mystery. The sensation, however, if permitted to grow with our life, cannot be called a healthy one, and ought to be reasoned with and calmed down into placidable reassurance by every means at our disposal. Confront the mystery, and ask the why and the wherefore. Why let the 'ghost' come and pass without an effort to 'lay' it?

In connection with derangement of the brain, we have in former articles shown how the 'sufferer' may see all sorts of things, and imagine all sorts of things, and we have striven to indicate the immediate and necessary connection that exists between the brain and all our actions.

The whole subject is invested with a wild kind of interest because it is not as yet altogether understood. We are as yet only approaching

certain branches of the occult science, if we may so term it, which relate to the 'night side of nature,' and though some of the shams have been unravelled, there yet remain others which it is for further advances of philosophy to deal with.

Without going minutely into the records of so called spiritualism, clairvoyance, and such like subjects of inquiry and experiment, it is easy to see that a vast amount of trickery and fraud has been connected with them, together with an easy credulity and fall on the part of a certain section of the public. The result of these disclosures has been that these departments of inquiry have been well nigh forsaken by many earnest and decided students of the truth. A not unnatural reaction has set in, and many scientific men of the highest standing, have not been slow to condemn wholesale, results derived from systems and practices which could give rise to such scandals. The general public also—though, as a rule, it is too readily duped—is not quite individually so subsant to that process on an average more than once, and those who have been discovered in deception are fain to shift their quarters frequently, in order to secure a fresh audience and the accompanying harvest of gain.

It will be apparent, however, on consideration, both to students and to less highly trained but intelligent readers, that the custom of rejecting as incredible all unexplained and apparently inexplicable occurrences may be carried too far, and may result in a possible loss in the amount of our required knowledge. To condemn as illus all results, however authenticated by observation and experiment, unless they square exactly with our present scientific knowledge of the laws that govern phenomena, is evidently to regard the results of scientific research in the present day as conclusive and final—a finality which is daily negatived by fresh discoveries. At the same time, such phenomena as are set forth professedly with the view of modifying or correcting old or current opinions regarding the spiritual or psychical side of our nature, must be presented,

so to speak, in broad daylight, without trickery or suspicious manoeuvring of any kind—must indeed rest on a basis of well authenticated and unimpeachable evidence. The nature of the evidence hitherto advanced here, as a rule, repelled inquiry on the part of honest men, for they have felt that at any moment they might discover themselves to have been the dupes and playthings of artful and designing impostors.

In this state of matters, it is of interest to learn that a movement is now afoot for the investigation of phenomena, psychical, magnetic, and spiritualistic, by men of scientific ability and standing. The inquiries are not formally pledged to any theories or opinions, the phenomena to be investigated. It is intended that those who are sceptical should unite with those who are firm believers in the phenomena in question, and that their rivalries should be conducted with an unbiassed view to their explanation, by evidence and personal observation, and to gather from these collated facts, thus established and confirmed, conclusions—if any—which may be warranted in regard to them, and to ascertain whether any practical results can be deduced therefrom.

'The Society for Psychical Research,' as this new organisation is called, has its work before it, and already—constituted in February 1882—the outline of its operations is before the public in the shape of the *Proceedings of the Society*, published in London by Messrs. Trübner. The pamphlet contains in plain English by the President, Henry Sidgwick, Esq., and papered by Professor Balfour Stewart, of Owens College, Manchester, the following:—(1) An examination of the nature and extent of any influence which may be exerted by one mind upon another, apart from any specially revealed mode of perception. (2) The study of hypnotism and the forms of so-called magnetic trance, with its alleged insusceptibility to pain, clairvoyance, and other allied phenomena. (3) A critical revision of Rouché's (his) researches with certain organisations called "mediums," and an inquiry whether such organisations possess any power of perception beyond a highly exalted sensibility of the recognised sensory organs. (4) A careful investigation of any reports, resting on strong testimony, regarding apparitions at the moment of death, or otherwise, or regarding disturbances in houses reputed to be haunted. (5) An inquiry into the various physical phenomena commonly called spiritistic, with an attempt to discover their causes and general laws. (6) The collection and collation of certain materials bearing on the history of these subjects.

This is comprehensive enough, and—with the instructive reservation, that, personally, we would rather not serve on the 'Committee on Apparitions and Haunted Houses'—we think the

programme embraces many interesting lines of inquiry. Mr. Sidgwick's Presidential Address is modest and thoughtful in tone, and in the course of it, referring to what the members have most to guard against—namely, fraud—he said: 'I think that even educated and scientific spiritualists were not quite prepared for the amount of fraud which has recently come to light, nor for the obstinacy with which the mediums against whom fraud has been proved have been afterwards defended, and have in fact been able to go on with what I may, without offence, call their tricks, after (as) we no less than before.' With such experience in the past, the members will require to exercise especial caution, as the very prominence of the Society is a body will be a temptation to a certain class of impostors. We envision their perverted ingenuity upon it.

The *Proceedings* collect among other things a report B. part on 'Thought-reading,' submitted by W. F. Barrett, Professor of Physics in the Royal College of Science for Ireland, Edmund Gurney, M.A., Late Fellow of Trinity College, Cambridge, and P. W. H. Myers, M.A., Late Fellow of Trinity College, Cambridge. The Report is one on which we would not wish to express a hasty opinion, we can only remark that it will afford some interesting reading to those desirous of investigating the subject. Professor Balfour Stewart, of Owens College, Manchester, in commenting on the Report, says that the facts therein narrated have been put in such a manner, that 'the only possible way of disputing the evidence is by linking at the unfairness of those gentlemen who have given it, and consequently their claims must be regarded as successful.' Thus is an honest statement of the Professor's opinion, but is a conclusion which we hope is not to be taken as a sign of the quality of reasoning power that this young society is to develop. Because we believe that the reporters are trustworthy, we are not necessarily to accept their facts as indisputable. We may not disbelieve their word, but we may doubt the accuracy of their impressions. They may be far from wishing to deceive us, but they may be unconsciously deceived.

Thought-reading—known also by the name of 'Will-impregnation'—is not wholly a new thing. The evidence pointed in this Report is, briefly speaking, an indictment of evidence towards an answer to the question with which it commences.

'Is there, or is there not, any existing or attainable evidence that can stand for physiological criticism, to support a belief that a vivid impression or a distinct idea in one mind can be communicated to another mind without the intervening help of the recognised organs of sensation? And if such evidence be found, is the impression derived from a real or partially developed, and hitherto unrecognised sensory organ, or has the mental concept been evoked without any antecedent sensory percept?'

men at our Club, the Chestfield, and, by Jove! I am late there, and must go—There, there, don't say—poor Clara—Well, will! We'll have another chat when you have rested, not to night, though, for you are tired, and I shall be late—Good night! I'll send Tucker! And the butler made his escape.

He was as good as his word, and Mrs. Tucker the housekeeper, having hastily arrayed herself in her robe of state—composed of stiff black silk, with metallic creases in its folds, and with a ghastly rustling about its sweeping disposition—came to tap softly at the door. She had a crumpled countenance, but the Dame Tucker, as though the many lines in her old face needed to have been ironed out by some experienced clothes-trucker, and her age was as unknown as that of the shiny gown which, having been worn on high days and holidays for who knows how long, had just been matched from its retirement in the recesses of a lavender-scented chest.

The old housekeeper made her way to where the new arrival, in her morning gown, with drooping head and disordered hair. She was as kindly and as dejected as her old and warped nature would permit. "Beg your pardon, miss—my lady—but your ladyship must be tired after such a journey, and I have Mr. Pagan's orders to— O my darling, my dear young lady, don't be so watched, at your first coming back—home!" For the new comers—some of those hidden springs that lurk deep down in the nature of us all, being touched, work a, by the old wretch's bal-bla—hug in to which, presently, as though his heart would indeed break. "O duty, duty, what you trust all Tucker!" exclaimed the housekeeper, tears unbidden at her time of life, as she wrinkled eyes, as she looked down upon his young charge in that abode of woe and distress.

Now, with all Mrs. Tucker's kindness, one thing was lacking, and that one thing was the very path and centre of our dealings with one another—confidence. But Pagan, but all the housekeeper very little, but her quick manner, in a, stimulated by the line of wonder and of mystery, which she shared with all her tribe, had wrought its magic. I rather liked Clara, however fully wronged, as Clara, bled in an unknown effort at imposture, was a woman beneath her master's roof. In either case, there had been a fraud, and there was a breach of the bundle of mischief. What a grand mistake it had been! And how proud, with an unselfish pride, had been the long-suffering spirit of the bankrupt Devon baronet. Mrs. Tucker herself, how had she braved the London bachelors, angry and unpaid, how had she combated the housekeepers, and overpowered upper servants of various but untitled families, on the strength of that great marriage of Mary Clara's. May be that Mr. Pagan's modest household had obtained a certain amount of extra credit through the official notice of this alliance. It is certainly the duty of no bridegroom—not even of a rich August—to settle his brother-in-law's bills, but yet there had grown up a heavy notion

that the impoverished lady would somehow let her husband's bills be paid by the distinguished husband of his late young sister.

But Tucker only knew that something was wrong, and had not the slightest idea to which side the balance of justice should incline. There was, moreover, in the matter, a great and unblinking element of self-interest. But it was difficult for poor Mrs. Tucker, even after her long experience of the ways of gentility, to distinguish between broken guilt and stricken innocence. Her own class would have behaved so differently! She could neither have dealt nor sustained the wrong without hysterics, angry recitation, valuable wealth, and vehement appeals to earth and heaven. This calm, shrinking sorrow was to her an enigma.

"If I might show you—your ladyship—some rooms—and it is late, and nothing really," exclaimed Mrs. Tucker, thankful to leave the butler's hall of disputed identity and take refuge in self-indulgence. "It hasn't been kept up, this house, is ought to be, added the worthy woman apologetically, "none but them careless London customers to look to it, and shatters up, and the moth getting into cushions and carpets, till they might as well give up the house, but he is a careful gentleman—well, miss, there is the morning room, that way, I am told, My lady your mother, and then I was thinking of the pretty blue room close by for a sleeping apartment. The drawing room, front parlour, they are all in ruin with moths and damp and moth and mildew. But the morning room—I'll show the maid. The two are light, and in their in your room, miss, unless your ladyship has other commands to give."

"Thank you!" That was all the girl said, as she rose, wearily and almost mechanically, from her chair. Her red and blue eyes half unconsciously avoided meeting the gaze of those two dark eyes which belonged to Mrs. Tucker. She went up stairs "like a lamb," as the housekeeper afterwards said, but perhaps it was merely a tired lamb, poor, uncomplaining, through the first and worst of her journey to the chamber. Whichever she might be, whether a victim or ill-used slave, the plotter or the victim, assuredly she did not do the best for her young self that might have been done. With very little trouble, she might have gained the hearty sympathy of all her brother's household—might have made enemies of every one of them, from the dignified housekeeper to the humble helper in the stable round the corner of the adjacent square. But she did no such thing, and when the hour of repose arrived, the victim of the domestic Iphigeneia that sat in judgment on us all was still, like that of a toothless jay in doubt—  
"Not proven."

Very markedly did Mr. Pagan's lonely character accept the services of his brother's housekeeper, the butler, that she was a friend of the upper, that she would attend the crackling fire, that she in the hall of a foggy London evening, the closed curtains, the newly arranged room. When at length her hand was on the pillow, she could not sleep for long, long hours, not until Mr. Pagan himself, with shuddering cheeks and thread unusually careful as he mounted the stairs, had come back

from his dinner and his card play. And when at last she sank into slumber, more than once her sleeping lips murmured softly 'Elizabeth—unlucky—oh, how I wish—'

## A D D

LADY BETTY GERMAIN avoided Swift for another fortnight with her friend the Duchess of Dorset for the bad example she set the set in Dublin, saying 'If she sees company in a morning, you need not grumble at the hour, it must be partly out of great complaisance, for that never was her taste here, though she is as early a riser as the generality of ladies are, and I believe there are not many dressing rooms in London but somewhere the early idle come.' Lady Betty evidently saw no impropriety in receiving visitors at her toilet, and probably laughed heartily at Adeline's condemnation of the folly of ladies who received gentlemen callers while still between the sheets, and, 'though willing to appear undressed, had put on her best looks, and painted herself for their reception.' Her host appeared in very nice discredit, as the night, when which was thrown upon her shoulders was ruffled with great care.

She carefully got up Anne thought herself well worth looking at, which was more than Madame de Munkton did when she gave audience to Peter the Great in her little room at St Oyr, for she writes 'The Great came after me in the evening. He sat down by the head of the bed, and I told me all I could. I answered "Yes." He inquired what my quality was. I replied "Latrine old." He seemed to be at a loss to answer. His next was brief. He drew the curtains at the foot of my bed to see me, you may be sure he was not satisfied.'

Awarded, the ladies of Queen Anne's time could see plenty of precedents for turning dining rooms and bedrooms into reception chambers. 'Till your sweet little Charles,' wrote Buckingham to him, 'times, I will wait at your bed before many hours pass, and by the grace of God, be at the death of a stag with you.' Had someone delayed waiting on his dear dad and gossip until much later in the day, he might have had to seek him in the same place, it being his Majesty's custom to go to bed in the afternoon. The king's mother, Queen Mary, at one period of her life, stayed in bed for days together, chatting with her ladies, discussing business matters with her councillors, or receiving ambassadors, as inclination prompted, or circumstances required. Anne of Austria always received company of a morning, and often of an evening too, in bed. The custom, however, had its inconveniences. When the Marchioness de Munkton returned from exile, so many persons visited her, that her elbows were called by long leaning upon them, as she sat in bed, giving and receiving salutations. Pippin very emphatically expresses his disgust with the fussing of the court, but that modest little gentleman himself kept unconsumably curly hours, thinking nothing of being out and about by moonshine, making calls upon lesser folk, who,

like Sir Philip Howard, received their disturber 'very civilly in bed,' or, like Sir William Coventry, and that pious nobleman Lord B. B., discoursed of official matters, while my Lord Sandwich would talk with him on state affairs for a couple of hours together in his smoking room and shut. That gallant commander, whether on land or at sea, was need to sign official papers without rising from his bed.

A Spanish minister signified his accession to power by going straightway to bed and staying there. It should be expected that something No. 1. It must be ever anticipated that ignoble expedient to escape performing his duties, but William Pitt, that William Pitt and the Duke of Devonshire held counsel together in bed. Pitt had the habit, and it was his custom when so afflicted, to order a pile of bed clothes in a smoking room. The Duke, who was terribly afraid of catching cold, but sat down upon another bed, in the warmest place available, drew his knees up to his chest, and lengthened out his limbs until he felt the bed clothes so snugly coming in all night, he felt the two ministers in bed at the same time, and the Duke, who Pitt had no need to be so cold, unshaved for some time after the grotesque nature of the scene. The Great Chamberlain was dead and taken when Wyndham and others of his cool heads burst into his room and shook their chief out of his slumber to tell him there was nothing in the fact, that the Admiral was a person in bed in his own ship, and in danger of death. Getting up in bed Pitt said 'I am pen, ink, and paper, and we are all the Admiral is not a fool, he upon the ship from the batteries,' turned out on his pillow, and was asleep again before his domestics were well out of the room.

The shadow of death was upon Fox when the Duke of Devonshire came for instructions before setting out for Germany, and followed so quickly on the heels of the great announcement, that Mrs Fox had only time to slip from her husband's side and take refuge in a closet. The interview proved longer than she expected or desired, and finding her signals of distress in the shape of snarly little lights, all unheeded, she perceived that she was in danger but to tap on the closet panel and ask if the young gentle man was going, as she was perspiring with cold. Looking at him with a smile, Lady Devonshire turned away for ever, and returned his shining will from her unpleasing situation.

When, in 1814, the military affairs of the allies looked somewhat unpromising, it was round the bed of General Kautsch, that the Emperor of Russia and Austria, the King of Prussia, Frederick, Volkmann, Schwarzenberg, Miltzsch, Radetzky, Dieblich, Neuchâtel, and Castlereagh held their council of war, and the issue of the campaign culminating in the occupation of Paris was virtually decided by Castlereagh insisting upon the immediate transfer of wavering Bernadotte's battalions to Blücher's command, and taking the responsibility upon his own shoulders. It was in bed, at the little inn of Waterloo, that Wellington received the terrible casualty list of the memorable 18th of June, and as some other time fell from his lungs a cry,

throw himself back on the pillow and groaned out 'What victory is not too dearly purchased at such a cost?' Wellington, who possessed the faculty of sleeping well, held that when it was time to turn, it was time to turn out Napoleon, a man of another temperamental pro- vided for wakefulness by keeping the returns of his army under his pillow, to be consulted and considered when such nature's sweet restorer refused to share his 'bed my master.' With some men, the mind will be busy out of proper working hours. It is not only you

Watches, and weepers  
Who turn and turn and turn again,  
But turn and turn, and turn and turn,  
With an untiring strain,  
And though his is a strain,  
That does not run upon chains.

There is no telling for how much of its literary wealth the world at this indebted to the quater- nary the bedchamber. Shakespeare were his imagination would not let him slumber when he should.

Wary with toil I leave me to my bed  
The day is past, and I have withered  
I sit there in a journey in my head  
To work my mind, and a body's work is ended

And we may be sure the poet did not wait the seasons of sweet slumber thought upon the remem- brance of things past. During the wretched peevishness, who, in the *Thyrs Lane*, lulled his soul's replies through the broken pane, rhyme- ers in wake, Pope boasts that he could sleep without a poem in his head, yet, at whose confu- sion,

I write of it in bed  
Looks come into my head and so I write

When in this history, model of modern fool, who live them, he was in the habit of compos- ing, or fifty verses of a morning, before rising, from his bed Gray's *Ode to Alfred* was born beneath the sheets. He had volunteered to write it for the Institution of the Duke of Devon as Chancellor of the University of Cambridge, on the ground that Chastelard should not be what, and leave Expectation to sing, but was in no hurry to set about the self imposed task. One morning, after breakfast, Mr Nicholls, calling upon Gray, roused him by knocking so loudly at his room door, that the startled poet, jumping out of bed, threw open the door, and hailed the visitor with 'Hail, aunt, 'ho holy ground.' Nicholls was inclined to think Gray had taken leave of his senses, until the latter set his mind at ease by repeating several verses quite new to him, and the recitation ended, saying 'Well, I have begun the *Ode*, and now I shall finish it.'

One of the last known lines in English poetry came into its author's head when he was actually asleep. While visiting at Minto, Campbell one evening went to bed early, his thoughts full of a new poem. About two in the morning he suddenly awakened, repeating, 'Events to come cast their shadows before.' Ringing the bell sharply, a servant obeyed the summons, to find the summoner with one foot in bed and one on the floor. 'Are you ill, sir?' inquired he. 'Ill,' cried Campbell. 'Never better in my life.'

Leave me the candle, and oblige me with a cup of tea.' Scaring his pen, he set down the happy thought, changing 'events to come' into 'coming events', and over the now incriminating cup com- pleted the first draft of *Lochiel's Warning*. A fellow's *Wreck of the Hesperus* came into his mind as he was smoking his pipe, the night after a violent storm. He went to bed, but could not sleep, the *Hesperus* would not let him sleep, and as he lay, the verses flowed on with it. Let or hinder him until the poem was completed. Wordsworth used to go to bed on returning from his morning walk, and while breakfasting there, dictate the lines he had put together on the march.

One of Johnson's earliest ventures in book making was the translation of *Lobo's Voyage to Abyssinia*, which put six guineas into his pocket. Lying in bed, he dictated sheet after sheet to his friend Mr. who carried them off to the printer without allowing Mr. Johnson to peruse them. When the list was on him, Rowin remained in bed, carefully drawing his curtains to keep out the daylight, and wrote himself up to the delights of composition. Scores of papers great and small, hundreds of letters grave and gay, came from Voltaire's bed at Ferney. In bed, I saw how composed his *Barbers at England* and *Voltaire*. One at least of Rowin's papers was composed under the same conditions. It was in the days when he was young, poor, and unknown, and lived in wretched quarters. After writing, a dust the manuscript slipped off the sheets and I used a table place under the bed. Rowin was too warm and comfortable to get out of bed to recover it, and moreover believed it would be unlucky to pick it up, so went to work to rewrite it. To his disgust, he could not remember it sufficiently, so he set about writing, a new one, and had just finished when a friend came into the room. 'Try that over,' said he, 'and tell me what you think of it.' The piece was pronounced to be very good. 'Now,' said Rowin, 'put your hand under the bed, you'll find another dust there, try that.' His instructions were obeyed, and the original composition dictated much the better of the two. Then they sang the new, Rowin in bed, his friend sitting on the edge, and arrived at the same conclusion. 'What will you do with the worst one?' asked the visitor. 'Oh, I shall turn that into a farthing,' answered Rowin, and he did.

Said, that is he was of him, in bed of a morning thinking of wit for the day, wrote to his friend Hervey. 'Pray, do not employ your time in lying about all noon to read Homer.' Better, perhaps, do that than imitate George IV, and be in bed devotedly, newspapers the best part of the day. Many very clever people, how- ever, have counted the asks of health, wealth, and wisdom coming of early rising. Many read much in bed and anxious to keep up in German, imposed upon himself the task of perusing twenty pages of Schiller every day before getting up. Mable was his name wrapped up by studying hard, long after midnight. Silk was up and about, cosily crumpled under the blanket. John Foster thought his senses out in bed, methodical Anthony Trollope, which read for an hour before rising, and Mary Somerville made it a

rule not to get up before twelve or one, although she began work at eight, reading, writing and calculating hard—with her pet sparrow sitting upon her arm—four or five hours every day, but those four or five hours were spent abed.

## FOR HIMSELF ALONE

A FAIR OF RIVERSIDE INFESTION.

CHAPTER VII

A WEEK had passed since the memorable interview between Frohisher and Mr Peabworth, without being productive of any event worth recording here. No other will the late Mr A. Law had yet come to light, and Peabworth, whose imagination had been so unduly influenced at first, was not merely becoming more anxious at each day's delay, but was evidently not without suspicion that he was being made the victim of some deception, the drift of which he could not fathom.

Frohisher, too, was beginning to tire of the part he was playing, and was considering within himself how most effectively to bring his little comedy to a climax, never dreaming that that very afternoon it would be brought to a climax for him in a mode totally unexpected by himself and every one connected.

That day a little party from Wylands had decided upon a picnic in Pilberry Wood, and to Pilberry Wood they had accordingly come. Lunch was now over, and Mrs Deane, who had volunteered for the post—all the others having strolled away out of sight—had been left to look after the party, which, at that critical moment, till the very last, she had been half hoping to see.

It was, however, rather singular that Mr Frank Frohisher, who had pleaded letters to write as an excuse for not coming with the others, should have found his way on foot to the place within a few minutes of the time Mrs Deane was left alone, and it was still more singular that that young lady should have betrayed no surprise at his sudden appearance. He is now here to assist her in the self-imposed duties of packing, folding, and putting away the things.

"That won't do at all," said Mrs Deane. "Your corners are not even. Try again—That's better. A little sliding does you good, you see."

"That altogether depends upon who the person is that scolds me," replied her companion.

"How do you like a picnic without the assistance of servants?"

"That also depends. In the present case it is very jolly, and I wouldn't mind being head waiter and bottle waiter in chief at all the parties of the season, provided I could always have a certain young person for my assistant."

"And I could go on folding table-cloths for ever, if I could always have you to help me—Thank, dear, what was it that first attracted you to poor insignificant me?"

"Don't know. Couldn't help myself, I suppose. With me it was a case of spoon at first sight."

"And with me also."

"I had not been five minutes in your company before I felt that my time was coming."

"My own feeling, exactly."

"All which goes to prove that we are made for each other."

Any one who dared to say we are not, would be a wicked story teller."

"That may be your best piece, Eliza. Are you not very fit?"

"Why should I be sorry when I am going to have a home of my own?"

"A home of your own—yes—but what a home."

"It won't be too small, Dick, for Hippocampus to dwell there."

Mrs Deane's delightful *été passé* with her weather was destined not to be of long duration. She and Frank were sleeping over in open hamper with their heads in close proximity, when they were startled by the appearance of Miss Peabworth, escorted by Dick Diamond with a shawl over her arm.

"Come along, aunt," said Dick. "Better like them never. But why didn't you come in the day?"

"It was the illness that time that kept me. That new cook of yours doesn't seem to know how to manage them. But when I heard there was a return fly, I came back to the village, I thought I would follow you."

"I'm very glad you have come," said Frank warmly.

"And so am I," responded Eliza. "Here is a most cozy old bunk for you to sit on, aunt. It's the best seat we can find you."

"It's quite good enough for me, my dear Dick, special dress, shawl, and Miss Peabworth's shawl, and I'll be as comfortable as a king."

"But now, what colour the girl has got," she added a moment or two afterwards, with her eyes bent on Eliza. "When I was young, if a girl had a colour like that, people used to say that her sweetheart had been kissing her."

Mrs Deane's cheeks took a still deeper tint. She turned away, and pretended to be looking for something in the hamper. "The prettiest you speak of, aunt, she said, 'as obnoxious now—' it kept in society. It went out with cold, little bonnets, short skirts, and mandarin."

"No, aunt, with you! Arising, as one of the things, that never got out of fashion. It counts as natural to young folks as the measles or the whooping-cough, and it's just as catch-"

Frohisher came to the rescue. "Miss Peabworth," he said, "as head waiter of this establishment, what shall I have the pleasure of offering you? What do you say to a glass of hot sherry and a piece of dry cherry?"

"Thank you, Mr Diamond, but I had my dinner long ago. You would call it luncheon, but I call it dinner. When Algonquin and we were first married, we used to have dinner regular at one o'clock. At the minute, and I like my dinner at that hour now."

"But you will take a little refreshment of some kind?"

"Well, if I must, I should like about half a glass of bottled stout. It's both neat and drink, as one may say." Then turning to Dick, she added, "I always like a drop of stout at a morning about eleven, or when I feel sinking and no how all day."

"Fine institution, about at eleven. Always in for it myself," responded Dick.

'But where is the rest of the party—Algernon and Clive and the others?'

'Gone in search of the picturesque. To be before long.'

'As if any of them cared twopence about the picturesque! Then turning to Frank and Elma, she asked, "But why haven't you two gone to look for the picturesque?"'

'If you please, aunt, this person is the waster, and I am his assistant,' answered Elma demurely. Mrs. Peabworth shook his head. 'Take care, he doesn't prove you to become his partner,' she said.

'I have already,' said Froisher gravely, 'asked Miss Deane to accept of that position.'

'The facilities being exceedingly limited, and the work uncommonly small,' murmured Dick. Mrs. Peabworth was staid. 'Is that true, Elma, dear?' she asked, with a little quiver in her voice.

'Yes, aunt. Mr. Drummond has asked me to set up in business with him.'

'And you have said?—'

'I haven't said No.'

'Come and kiss me, child. You have made me very happy.'

Elma kissed her—more than once, and Mrs. Peabworth cried a little, in a not natural under the circumstances.

'May I ask you, Mrs. Peabworth, to kindly keep this little affair secret for a few days?' said Froisher.

'I'll keep it secret as long as you like, but whatever Algernon will say when he comes to hear of it, I for one don't know.'

'We are prepared for the worst—we have made up our minds to rough it.'

'Yes, aunt—to find a long farewell to the pumps and vanities of this wicked world, put in time.'

'I like to hear you say that. I like to see two young people who love each other so well shut a little poverty doesn't frighten them,' said Mrs. Peabworth heartily.

'And now Nephew Frank,' she added, turning to Drummond, 'suppose you and I go in search of the picturesque!'

'With all my heart, aunt, I am quite at your service,' answered Dick.

'They will like to be left to themselves a bit,' said Mrs. Peabworth in a stage whisper. 'Most young people do at such times.'

'Soon fire of that after marriage,' responded worldly-wise Richard. With that he offered Mrs. Peabworth his arm, and they strolled off down one of the paths, between the trees.

Miss Deane produced her embroidery and set down on the same mossy bank, busily occupied by her aunt. Frank flung himself on the turf at her feet.

'I wish all the rest of the world would live themselves in a wood and not be found in it so long,' remarked Elma.

'So do I wish all my heart.'

'Mr. Dempsey is going to propose to me to-day—I know he is.'

'The donor he is! But how do you know?'

'I've a premonition which tells me that he.'

'You won't be jealous, will you?'

'I! Not a bit jealous—of Mr. Dempsey.'

'He is very rich.'

'He is very old and very ugly.'

'So much the better. I am, and handsome husbands are as plentiful as blackberries—but I don't, even grained, snuffly old dukes! And one need never be jealous of him.'

'Mr. Dempsey goes a long way towards fulfilling your requirements.'

'Yes, but I shall be obliged to refuse him.'

'Why?'

'Because I have promised myself to you—Heaven help me!'

'Why do you wish, Mrs. Deane?'

'Can't one wish without being called upon for an explanation?'

'I thought that perhaps you were wishing because you had lost the chance of marrying Mr. Dempsey.'

'You are a great goose, and you thought nothing of the kind. Besides, Mr. Clever, if I wanted to marry Mr. Dempsey, what is there to hinder me from pitching you?'

'A thorn.'

'Then believe yourself properly—I see Mr. Dempsey coming this way. O dear! what shall I say to him?'

Frank springing on his feet. 'So long as I am here, the old gentleman will hardly venture to interfere!'

'But I don't want you here, I want you to go away.'

'You do, do you! And Frank, opening wide his eyes.

'Of course I do. I shall probably never have another offer of marriage, so long as I live!'

'And you don't want me now this once?'

'No, now I don't. What will you do?'

'In that case I will say no more.'

'You will not be long, will you?'

'Not more than half an hour.'

'So to it, then! I shall put Mr. Dempsey out of his misery very quickly.'

Frank laughed and a little, and disappeared behind a clump of trees. Elma resumed her seat and her embroidery.

Mr. Dempsey, pinking his way carefully, and wearing his hat a little more in one side than usual, came slowly forward. His countenance was defective, and he had a tawny forehead. He took off his hat with an elaborate flourish. Elma looked up with a heightened colour, but with a mischievous smile playing round her lips.

'I am so fortunate in finding you alone, Miss Deane, and this, exactly as I wish with a smile.'

'Why fortunate, Mr. Dempsey?'

'Because I have something to say to you that concerns ourselves alone.'

'A secret! That will be delightful. Go on, please.'

'Mrs. Deane, I am a plain man.'

'Hum—well—you ought to know best, perhaps.'

'A plain-spoken man, Miss Deane. I cannot indulge in any of those sentimental rhapsodies proper enough at twenty, I discern, but which are slightly ridiculous at—hum—at fifty. I must come to the point at once. I respect you—I admire you—I love you, if you will allow me to say so, and I am here to ask you to become my wife.'

'O Mr. Dempsey!'

'I am not a poor man. A liberal allowance would be yours. You would have a handsome'

attainment, diamonds, your own carriage, every comfort, in fact, such an offer is not to be had every day. What say you, Mrs. Deane, what say you?"

"I say with you, Mr. Dempsey, that such an offer is not to be had every day. Were I a leopard, or an owl, or a lion, I would say Yes to it; but being only a woman, I must say No."

"I should do my best to make you happy." "I do not doubt that, as you do your best to make your birds and animals happy, you keep them warm, and you feed them well, but—just shut them up in cages. Now, I don't want to be shut up in a cage, even though it were a gilded one."

"You are thinking itself, Mrs. Deane, but I hope I am not taking this decision as a final one!"

"It is usually as if you took upon it as such." "Well, well, I ought to have been in the field a couple of years ago. Young ladies of twenty now-a-days can generally pick the cream of a pair of attachment."

"A pair attachment, Mr. Dempsey? Why, I have been the victim of half a dozen prior attachments before I was married."

"Oh!" "When I was six years old, there was a little boy with curly hair whom I absolutely loved. He wore red shoes, and I think that was the reason why I loved him. He must be grown up by this time. I wonder whether he wears red shoes now. Then, when I was at school, I thought my dancing-master the most delightful of men. He was a Frenchman, and very tall, and oh! so fat, but I loved him. He spoiled the most charming-looking English, and I fancy that was the reason why I was so fond of him. When our touching reminiscences, Mr. Dempsey."

"To you, doubtless, Mrs. Deane," answered the old lady stiffly. "I have you to remember, if not a wiser man."

"And I have been doing my best to amuse you!" "O dear!"

"Is there absolutely no hope?"

"Absolutely none."

Mr. Dempsey lifted his hat and bowed ceremoniously. Mrs. Deane rose and dropped an elaborate courtesy.

Mr. Dempsey turned to go, but had not proceeded half a dozen yards before he came to a stand.

"Mrs. Deane!"

"Yes, Mr. Dempsey."

"I have some good news for you. I had a telegram this morning, and the post is better—much better."

"I'm so very glad to hear it."

"He can now take his usual allowance of fish for breakfast."

"How nice! I should like his photograph. I am particularly fond of pictures."

"No, really? You shall have a photograph next week without fail. As reward, may I say?"

"An offer of marriage, even from a Dempsey, is calculated to flatter one's nerves a little," said Elma to herself. "Crewel work seems very tame after it. I wonder what Elma would say if she knew she would say I was a fool for refusing him, and she would believe it too!"

It is rather when Mrs. Deane took the first footstep through the door that presented itself, without caring whether it might lead him, his thoughts being far away. He had gone no great distance, when a sudden turn brought him face to face with Mr. Pelworth, who had discreetly lingered behind Mr. Dempsey, being probably quite aware what object that gentleman had in view in seeking a tête-à-tête with Mrs. Deane.

"Ah, my dear Mr. Richard, a word with you, if you please," he said with a wily smile, the moment his eyes fell on Frohisher.

"A hundred, if you wish it, Mr. Pelworth."

Mr. Pelworth laid a hand on Frohisher's arm, and then glanced suspiciously round. "Any news of the second will yet?" he whispered.

"Not yet, Mr. Pelworth. But I am busy, very busy, going through Mr. Ashwe's papers, and I should not be surprised in the least—not in the least, Mr. Pelworth, I assure you—if I were to come across some such document before the present week is over."

The two men looked meaningfully at each other for a moment, and then Mr. Pelworth's eyes fell. He was wondering what he should say next, when Frank spoke.

"I am right in assuming that Mrs. Deane is worth a eight thousand pounds?"

"That is the amount to a penny—dependent entirely on my consent to her marriage."

"Precisely so. That is clearly understood."

Another look, then Pelworth said, "I am going in a week of a clergy and clerk. Will you not go back and join me?"

"Thank—no. They tell me there is a chum view from the high ground over you!" "I am going in a week of it."

"Then you will probably meet my daughter and Captain Dyson. They wait that way half an hour."

"Richard Drummond, I hate you as I never hate a man before," was Mr. Pelworth's unspoken thought as the two men turned their backs on each other and went each his own way. But presently his manner assumed a more reserved hue. "With two thousand a year derivable from landed property, what more I not aspire to?" he muttered to himself. "And the method of obtaining the price so safe and simple! Before I'm ten years older, the two thousand a year will have more than doubled itself, unless I in a corner as thin I believe myself to be. And then, why not a seat in the House? I must begin to define my political principles more clearly. At present, I hardly know whether I am a Liberal (imperfective, or a Conservative Liberal, or both."

## TO THE STAGE STRUCK

IT IS sometimes to take a retrospective view of the past, to think of bygone scenes and places, to glance over the notes in your commonplace book, to dwell on the memory of old friends, and read their thoughts. The other day I came across an old family correspondence which I had carefully preserved. It carried me back to twenty-five years ago, and I could not help contrasting my present feelings with those which actuated me at that time.

The following extracts may be applicable to some young friends just entering life, and may induce them to think twice before they run counter to the wishes of their relatives, or hazard their future prospects in order that they may gratify present desires. The following, is a letter which my mother wrote to my late uncle regarding me.

"I am somewhat perplexed as to Henry's future. He was anxious to follow his father's profession, and wished to prepare himself for Woolwich, especially as his companion Murray, who joined the Military Academy there last year, assured him that he would have no difficulty in passing the requisite examination. He has bitterly disappointed when I explained to him that I had not sufficient means to enable me to meet the necessary expense, but happily an old friend came to my rescue, and procured for him a nomination in a highly respectable public school. My friend tells me that Henry passed an excellent examination, and was immediately appointed to a clerkship at a salary of a hundred pounds a year. He has been in this situation for the last eighteen months, but, I am sorry to say, is getting very unsettled, and dissatisfied with his occupation and prospects. I have told him to consult you, and I feel sure that you will give him wise counsel."

This communication prepared my uncle for a letter from the youth himself, who he received a few days afterwards. The young fellow wrote in a somewhat jaunty and slangy style, and informed him that he intended to join the Amateur Dramatic Club and taking lessons in elocution from some actor, leaving by such means to ascertain whether he was likely to succeed if he adopted the stage as a profession. Should he meet with an urgent summons from his tutor, in thought of relinquishing his present position and prospects and of becoming an actor. "Will you, he wrote, look at the matter impartially, and let me know what view you take of the plan I purpose adopting."

Now, probably one of the most responsible duties of a parent or guardian is to offer advice to a youth, the adoption or rejection of which must necessarily affect not only his present position, but his future career.

Feeling, wrote my uncle, that in an unimpaired country bred lad on his first visit to London, or any other great city, would naturally be dazzled by the various temptations he encountered—amongst which dramatic entertainments would probably be the most attractive—I could not help making charitable allowance for the enthusiasm of a youth, young with optimistic views of the art, whose flimsy self-confidence—perhaps of some sublime creation of the poet—struck a chord which vibrated in every heart of that crowded audience of which he formed one. I could picture him listening with breathless attention to the impassioned language which so powerfully appealed to all the feelings and emotions of the human heart, and joining in murmurs of demonstrative heed, well merited applause, and becoming fired with the ambition to win for himself similar renown.

He little dreamt of the long and severe course of study which has been undergone for even

genius to attain such a position, nor does he realize the difficulties which have been overcome. He only sees and admires the finished picture, that great art which composes the art, deceiving himself into the belief that his capabilities are equal to his admiration. But he wants to know my views, and I must give them. It is far better to write frankly to him myself, than allow him to learn my opinions from a third person—Having arrived at this resolution, my uncle wrote to the youth as follows.

"In answer to your request for advice, I must say that under ordinary circumstances I should simply decline offering my opinion, because experience has taught me that it is only gratifying the curiosity of an individual to give an opinion on a subject upon which he has already made up his mind, and I hold it to be the reverse of complimentary to ask my name to take the trouble of so thoroughly considering a subject that he may give advice upon it, if such advice is not to be followed. In making an exception in your favour, I do so because you have no other living teacher, and it is the critical period of your life, and I feel it a duty to the best of my power to give you such advice as I can, for your future, and I feel sure that you will not think me discourteous or unkind if I write plainly."

"The course you have 'snapped out for your self,' to use your own expression, will, in my opinion, lead to no good result. Although some members of your family and some of your old friends may always acknowledge you, you will, by your own act, so entirely remove yourself from their circle, from such society, and move amidst people with many of whom they can have no sympathy, that you will probably wear yourself down through indifference. This and you will have little in common. You will not be profitable to them, then, and it will be to you. You will be committing a kind of moral suicide, which your friends will necessarily deplore."

"I am well aware of the ungovernable nature of youth, and can comprehend that you believe yourself to be actuated by an enthusiastic love of art, and, deluded by hope, fancy that you may command success and develop into a dramatic artist of celebrity. Of the thousands who indulge in such aspirations, how many realize them?"

"Does your ambition satisfy itself with the idea of becoming an ordinary comedian? I can scarcely think so. Do you, then, expect to become an artist of world-wide reputation? If so, have you reserved the immense amount of hard work and weary toils you must undergo to attain your object? or how, in the earlier stages of your career, you will live."

With best wishes and ever-prising humility,

to seek the patronage of some theatrical manager, in order to get an engagement on some provincial stage, and be contented with some few shillings a week to enable you to support existence, and continue those studies so absolutely central if you desire to succeed in the calling? Have you thought of the jealous rivalry amongst those whom you would have to contend with for engagements? and—metaphorically speaking—the dirt

that you would have to eat, this ends to ■  
paripititol, that manna to be consulted, those  
actors to become popular with?

'You may say that genius rises superior to these  
obstacles, and regards them as minutiae rather  
than impediments to success. Very true, and I  
believe that a man who happens to be endowed  
with great genius, superior ability, and mental  
culture, and possessed of an immense talent  
to enable him to live decently while he is poor,  
through the three or four years of his novitiate,  
might—assuming that he had a strong predilec-  
tion for the stage—develop into an actor of great  
reputation, especially if he had a strong physique,  
high spirits, undisturbed courage, and great self-  
confidence. Such a man might indeed become  
great in his art, or indeed in any calling he  
could find. But have you these qualifications?  
I think not. You have far average abilities,  
but are certainly not well read in world know-  
ledge. Except the salary you earn, you have  
no income. You have not a strong physique,  
a natural flow of animal spirits, or self reliance. On  
the contrary, your constitution is not strong, you  
are naturally of a retiring disposition, and so  
far from being self-reliant and confident, you  
are particularly sensitive and thin skinned. These  
constitutional characteristics, in my opinion, indi-  
cate that you do not possess the qualifications  
 requisite to meet success in such a calling.

'That you might overcome what is known as  
"stage shyne," and be able to shake out a lively  
hood somehow, I doubt not, but would dis-  
advise you. If it would, I cannot sympathise  
with your trick. Having once taken to the stage,  
should you become disinterested with your progre-  
ss and prospects, what opening could you look  
forward to? You would have lost so much time,  
and thrown overboard whatever interest you  
have, in such a manner that you could not hope  
to turn your attention to any other occupation,  
and must perform to-morrow in the position of a  
second rate actor.

'Now, let us answer this desire to go up in the  
stage. What does it let him? A love of appro-  
bation, a vain glorious desire for notoriety—  
in a word, vanity—a vanity which requires  
applause for maintenance, and which withers under  
the faintest smile of ridicule. (Will you stand  
the latter? Would you be able to laugh it off?)  
Would it not rather render you nervous, chafed,  
and disheartened, and make you compare yourself  
a martyr to the love of it, and a victim of pe-  
judice?

'You seem to have a fatal but one idea, the  
object being to gratify a mortal vanity in the  
shape of an intense love of approbation. Take  
care that such weakness does not so mar your  
in growth as to become a species of mono-  
mania.

'I would warn you against being influenced  
by mere self-gratification. You must remember  
that "life is real, life is earnest," and that  
each man should be influenced by a sense of  
Duty. Having been placed in a good position,  
with opportunities of advancing yourself by  
your own industry, is it not your duty, as  
it should be your pride and pleasure, to en-  
deavour to repay in some measure the deep  
debt of gratitude you owe to that loving and  
wonderful mother who has devoted herself with

so much affection and self-denial to promote  
your welfare and happiness? to strive to render  
her future happy, and as the eldest son, to act  
an example to your younger brothers? Will  
you be fulfilling these duties by giving up your  
present occupation and prospects, regardless of  
any consideration for the feelings of those who  
have so great a claim upon you?

'You have now a fair start in life, and can  
by ordinary diligence materially improve your  
position, and qualify yourself for other and more  
remunerative appointments. You have also an  
opportunity of cultivating your literary and  
artistic tastes, and of turning such accomplish-  
ments to good account. By adopting such a  
course, you would insure the love and affection  
of your home circle, and retain the respect and  
confidence of all your friends and relations—thus  
earning a far more certain reward than the  
faint plaudits of the most sympathising audience,  
for in all the troubles and disappointments you  
must meet with in life, you would be comforted  
by an approving conscience, and sustained by a  
claim of self-respect.

'So in answer to the youthful query was I  
unwilling to let was dissipating to him, and  
for some months longer he remained unsettled in  
his mind, wavering between inclination to duty  
his better nature at length prevailed, and he at  
last firmly determined to follow the advice of  
his friends. He soon became as cheerful and  
contented with his position, as he had before  
been dissatisfied. He rapidly mastered all the  
technicalities of his business, and devoting some  
hours each day to study, he found himself gradu-  
ally but surely ascending the steep path which  
led to success.

He is now a middle-aged gentleman, possessing  
a fair competence, and but for an occasional  
tinge of gout, enjoys excellent health. It forms  
a pleasing picture to see him surrounded by his  
wife and family, who all go with one another in  
their care and attention to his dear old mother,  
who lives with him, and when his younger  
sisters come to pay him a visit, as they often  
do, he sometimes alludes to his youthful aspira-  
tions, and speaks with gratitude of those who  
dissuaded him from making what might have  
turned out to be a disastrous failure.

But he has not altogether lost his love of the  
dramma. Occasionally, a strolling company of  
actors announces their arrival in the neighbour-  
ing town, and so regularly does he patronise  
such performances, that the bookholder always  
reserves certain seats for him and his party. He  
not infrequently plays a part as a brother, who  
resides in London, who very considerably pro-  
pounds during at six o'clock, and going to the  
theatre afterwards, a suggestion he is only too  
delighted to fall in with.

I have known him on more than one occasion  
smile at the thought of some poor actor, whom he  
contemned he once thought a person to be envied  
and admired. Now he whispers to his brother  
'Charles, I no longer envy him, or think him a  
hero, but I feel the disappointment that he and  
many others must have suffered, and rejoice that  
I can afford to give an annual subscription to  
the Actors' Benevolent Fund.'

How very many ladies there are who have tastes

simila to those this young man once fondly indulged in. If any such should happen to read these lines, it may induce them to know that the writer is not too old to sympathize with the aspirations of youth, or to make every charitable allowance for its weakness. They will the more readily believe this, when he reminds them that he has been giving thus a rough sketch of his own life, and that he has lived long enough to appreciate the wise counsel of wisdom and experience.

## MELITA, THE BOHEMIAN GIRL.

1

TOWARDS the close of a sultry summer day, a young Bohemian, alighted from a travelling carriage at a small inn in the village of Montarone, in Italy. In reply to the obsequious landlord, with whom guests of the modest class were 'like angels' treated, few and far between, he announced his intention of remaining for a couple of days, desired to be shown to his room, and ordered coffee to be served in the parlour. In a few minutes he descended to the public room of the inn, and with much relish sipped the cup of refreshing coffee which the landlord had brought in, and delecting the cigars proffered by the latter, proceeded to fill and light a few more cigarettes, and blowing clouds of fragrant smoke towards the low ceiling, was soon immersed in a brown study.

The traveller, whose name was Frank Melville, was about twenty-eight years of age, and a specimen of manly beauty. Dressed as he was in his stockings, his figure was well proportioned; but you did not give him credit for more than the average height. His short, curly, light brown hair fitted him well; his countenance ruddy with health and sparkling with good humour, while the deep blue eyes shone with intelligence. He was an artist, and had seized the first opportunity to put into execution a long cherished intention of making a tour in Italy, and the desire of beholding such scenes had induced him to turn aside considerably from the well beaten route pursued by the ordinary tourist.

He had hitherto experienced great pleasure in his tour. But nevertheless, when the shades of evening began to fall, he gradually felt somewhat solitary, and longed for some companion with whom to compare notes and exchange ideas. On the particular evening on which we story opens, he felt more than usually restless and low spirited. A craving for some excitement took possession of him. But in the quiet, secluded village of Montarone, what excitement, mental or physical, could be found?

There being no other way open to him of passing the time, he decided to try a stroll. The narrow, irregular street of the village was almost deserted, nothing was to be seen except some children playing in the sand, and game walking in long processions, cackling as they went

standing rapidly on a hill, Melville soon came to the outskirts of the village, and plunged into the adjoining forest. The luxuriant foliage of the stately trees, which were in the full vigour of their growth, naturally obtained his chief admiration. The air was scented with the odour of fresh resin and mosses, while a perfect stillness, of a warm, prevailing, more fitful, however, to increase his depression, than to afford him the mental stimulus for which he craved. He had walked at a snail's pace for some thirty minutes, when the sudden sinking of the sun and the deepening twilight warned him that it was time to retrace his steps. Turning back, he was soon conscious that he had lost his way, and began to lament his imprudence in venturing so far into unknown and apparently trackless forest without having taken some bearings, by which to guide his course.

Just as he was beginning to regain himself to a night's rest, he discerned the smoke of a fire at no great distance, and heard in the still evening air the notes of a violin. A walk of a few minutes brought him to the scene. In the shelter of the walls of an old ruined castle were seated some twenty or thirty couples, grouped in every variety of picturesque attitude round the customary tavolna, in which hung a large pot over a willow. The men wore red waistcoats, ornamented with light olive buttons, which glittered in the sunlight, the women—at least the younger ones—wore red bodices and chemisettes trimmed with gold embroidery, and round their necks rows of glass beads. A few withered old women, yellow and toothless, who served as substitutes for the younger companions, completed the band. As the fire gleamed and flicked on the picturesque group, so bright with colour, Melville longed for the pencil of a Salvator Rosa, that he might preserve the scene for ever on canvas.

The upper who had been performing on the violin ceased playing at the approach of Melville, and squeaking in excellent Tuscan, invited him to be seated and join their primitive repast. Melville accepted the invitation as frankly as it was given. From boyhood, the Zingari, their origin, strange customs, and unwelcome, had been a favourite subject of study with him. He had read many of the books describing these wonderful people, Dorothea Schlegel among the rest, and was familiar with a considerable portion of the vocabulary of the Italian gypsies, indeed, the manners and habits of this roving race had always possessed for him a peculiar and fascinating interest.

In a few minutes Frank was discussing a portion of a hedgehog, which, rubbed with garlic and stuffed with walnuts, had been roasted on a spit over a quick fire.

'Where is Melita?' exclaimed the violin-player, whose name was Orlando. 'What has become of her?'

Our tourist was in the act of raising a cup of some very good Scotch wine to his lips, when his look fell upon a vision of feminine beauty such as he had never before seen in all his travels. Through the opening of a tent came a young girl, apparently not more than eighteen years of age, brightly above the middle height, her slender figure more moved across the grassy carpet with lightening grace. Large oriental eyes, full of liquid lustre, softly gleamed from beneath eyebrows black as night. The features were perfect in their contour. The finely chiselled nose, the lips, 'the Cupid's bow,' the softly rounded chin, might have served as models to a modern Phidias. The diamond ear was of a lighter tint than the diamonds, and of a rich warm tawny hue. The complexion was also some what lighter in colour than the ordinary gipsy type, but still sufficiently dark to show that she was a Bohemian stock.

Gradually turning to his feet, and extending his hand, Melville offered to conduct her to a place in the evening meal with an air as respectful as if he had been waiting in English drawing-rooms. But the gipsy girl refused the proffered hand, and seating herself by the side of her brother, gazed with some little curiosity at the stranger guest, and declined to partake of the repast.

Supper over, the artist threw the contents of his large pouch with his host—there is no man proportion to the heat of a gipsy than to smoke him a pinch of tobacco—and then sat down with unalloyed pleasure to the musical efforts of Orlando on the violin, at the same time that he observed the effect of the wondrous instrumentation on the eloquent features of the Bohemian girl, which seemed to reflect all the varying emotions of the player.

Suddenly, it occurred to him that the lovely Melita in her natural colour would form an admirable subject for a water-colour sketch. Turning to Orlando, he inquired if he might come on the following morning to the camp and take a sketch of his sister. Melita looked at the whispering request, and her dusky cheek for a moment deepened with gratified sympathy as she smilingly assented to the inquiring glances of her brother. When about to depart, Frank heard with some surprise that he was only a couple of miles from Vienna, so confused had been his attempts to find his way through the labyrinth of lanes. Orlando volunteered to conduct him to the outskirts of the wood, and, accepting the offer, he bade adieu to the lovely Melita. During Orlando's brief escort, Melville spoke little, for least his words could be the eloquent language of the gipsy girl. Even disturbed dreams, Melita's face appeared again and again; and it was with wearied satisfaction that the artist beheld the morning sun glancing through the windows of the inn.

'This is your last sitting, Melita.' It was on the morning of the seventh day after Frank Melville had first met the Zingari that these words were spoken. The young bootmaker was putting the finishing touches to a large water-colour drawing

representing Melita as a gipsy queen. The process of the work had been watched by the tribe with mingled feelings of wonder and delight, and the gipsy dark eyes had shone with pleasure and pride as she looked upon the life-like portrait of her wondrous beauty.

The knowledge which the young artist possessed of gipsy manners and customs had placed him on a special footing with Melita and the other members of the band, so that they almost regarded him as one of themselves, and referred to matters in his presence which they would have carefully shunned in the view of any other 'home dweller.' Melita would sometimes speak of the pleasures of her nomadic life, its liberty and freedom, its health giving character, its opportunity for the study of the changing seasons, the animals and birds abounding in the fields and woods, on which occasion Frank would feel his pulse beat faster, until he almost yearned to renounce the peaceful and tumultuous life of cities, and, residing in his lot with those who dwell in tent, never more to turn to the walks of ordinary life.

In reply to his observation that thus was her last sitting, the Zingari cast down his eyes, and murmured: 'I am very sorry.'

'Sorrow, Melita! I can assure you that, as a general rule, the last sitting is always a day of rejoicing—at least to the artist.'

'But I will not say, now that the picture is finished.'

He was not certain, but he rather feared that he saw a gleam of the Zingari's eye. 'You say that?' 'Well, he answered, 'my stay here is coming to an end, I must admit, but I can afford a few more days. Come let us have a stroll.' Slowly the pair walked in the direction of a running stream near the gipsy encampment. 'Melita, I must make you some return for your good nature in inviting me. What shall I give you?'

The girl's dark eyes flashed indignantly as she turned them to those of the speaker, and Melville beheld an expression on those lovely features which he had never seen before—in expression which won him to bewail of the gipsy's nature. He started to hasten to explain.

'Not money, Melita, I do not mean that—of course not. But what is there that you would like to have for your picture?'

Melita gripped both his hands within her soft warm palms, and looking sweetly at him, whispered: 'Give me your picture, in return for mine. Then, when you are far away beyond the sea in your own country, that will remind me of these happy days and of the stranger who was so kind to me.'

'I am glad that I can comply with your request at once,' Melville answered, 'but I wish that you had chosen something else. I am afraid my photograph is a poor recompense for all your patience and kindness in sitting to me. So, I have come with me in my pocket book.' With these words, Frank took a card from the book and handed it to her.

Melita gazed earnestly several moments at the young bootmaker's handsome lineaments—it was a capital likeness—and she did so, her cheek became pale, and the hand which held the picture

trembled visibly. Then placing the picture on her bosom, the Bohemian murmured: "It shall never leave my heart!" Adding, after a pause: "Come, let us return to the camp."

Returning then, they walked on for some moments in silence. Melville was by no means a vain man, but of course he was not ignorant of the fact that he was handsome. An unpleasant suspicion crossed his mind: "Can it be," he asked himself, "that this young girl has fallen in love with me?" Then, as he remembered her warm, sensuous nature and the violence of her passions, he shuddered. But on the other hand, he had only known her seven days. However, he decided that it would be best for him to depart at once, before any tender impression he felt unwittingly might should sink too deeply for her peace of mind.

Melita was the first to break the silence. "Do you know why I asked you to return to the camp?" Then, without waiting for a reply, she continued: "I felt that I could not remain in safety near the water."

"In safety near the water?" What in the world do you mean?" was her companion's astonished exclamation.

Smiling wilyly, Melita answered: "Have you never felt an almost uncontrollable impulse—an impulse you could not account for—to do some rash act—to throw yourself from some dizzy height, or plunge into some rapid stream, and thus end at once and for ever all the cares and sorrows of life?"

"My youthful Melita," he said, "can I really have had troubles sufficient to cause her to seek relief from them in a sudden and violent death?"

Again, the Zingari shook her head wilyly. "I know not," she said. "But had I been it just now, I should have sought death in that running stream." Then, observing her companion's anxious look, she brightened and exhibited her expressive features as he said: "But do not be concerned, that moment has past."

"For ever, I trust!" Melville gravely asked.

"Yes, for ever!"

They had now arrived at the camp. The startling confession to which he had listened during the last few minutes had strengthened Melville's resolve to leave the place without delay, but he further unphrased his intentions. He would return to the inn in the village, and deposit a hasty note to Melita, saying that he was unexpectedly compelled to leave immediately for Bologna. In this way he hoped to avoid the awkwardness of a personal farewell.

Although he felt that such conduct might be termed shabby after the hospitality he had received from the gipsies, and Melita's kindness and good nature in attending by the hour to the model for his picture, he felt also that anything was better than a scene. It was both an act of kindness and a duty to nip in the bud an attachment he could not return. The first thing to be done, however, was to get possession of the picture. Turning to his companion, he said: "Melita, I am going to remove the picture to the village this day."

A suspicious glance shot from her hazel eyes. "You are going away—I feel it! I shall never see you again!"

The artist had his hand on her arm, and as he did so he felt the hand he held tremble. An irresistible temptation seized him, but he resisted her. He felt that he was taking a leap—an everlasting farewell, and those three parted, with not another word being spoken between them.

After he had proceeded some little distance, he turned and waved his hand to the girl, who still remained where he had left her, motionless as a statue.

Frank Melita was a man of prompt action. Within an hour of his return to the inn, he had left the village of Montevio, first depositing a brief note to Melita, telling her that urgent business called him away, and regretting the necessity of his sudden departure. He then took up his quarters at a small village about twenty miles from his former halting place, and determined to remain there for a day or two, until he had decided on his future plans. He felt in a depressed state he had thought possible, in consequence of putting, from the charming Zingari. In vain did he endeavor by writing, smoking, and eating food, to turn his mind to his thoughts. Wherever he went or whatever he did, the gipsy girl's face was always before him.

On the evening of the third day after he had left Montevio, he was seated in the little parlour of the village inn. He had hired two rooms, his bedroom in the morning immediately behind the sitting-room, and both on the ground floor. The landlady called, and said a visitor wished to see him. While Frank was wondering who it could be, a step was heard in the passage, and a young girl appeared just the landlady and came into his guest. It was Orlando! His bewitching unkempt hair in expression of bitter indignation.

Melville held out his hand, and uttered a welcome in Italian. But Orlando took no notice of the outstretched hand or the young bohemian's salutation. His left hand played nervously with a long bright lock which was stuck loosely in his belt. "Where is Melita?"

The words were uttered in an intense whisper, the while his coal-black eyes, lined with some hidden emotion, were fixed on Melville as if he would read his mind's thoughts.

"Melita! Is she not with you? I have not seen her since I left the camp."

The gipsy panted. Then he asked: "Is that the truth?"

Melville springing to his feet, his face aflame with anger: "If you were not Melita's brother, I would throw you out of the window!" was his passionate exclamation.

Again the gipsy panted, perfectly unmoved by the angry reply. He had never left his prison since from Melville's face during the interview. Apparently satisfied, he now extended his hand, and said: "I believe you."

"But why, Orlando?" Melville asked. "Tell me, what has happened? Where is Melita?"

"I only know that she left the camp directly she received your letter."

"And where are you now?"

"To find her, if I can," calmly replied Orlando, as he strode rapidly from the room, leaving

And I pass to the most torturing suspense and anxiety. But this was not of long duration. As he sat by the window musing on the strange news of the girl's sudden disappearance, the shadow of a human figure was projected up in the newspaper which lay unheeded at his feet. Looking up, he beheld Mitha! Hastening to the door, he opened it, and led her into the room.

'Have you seen your brother Orlando?' he asked.

'(Orlando here?' came in such a faltering voice with fear from the girl's white lips, as she slowly sank into Melville's arms in a half-fainting condition. Squally reassessing herself, however, she darted an apprehensive glance towards the door, and said 'If he finds me here he will kill you!'

'Calm yourself—don't be alarmed, Mitha, no harm shall happen!'

'Ah you know not Orlando's nature! Forget me for coming to you, but I longed so much to see you! I felt that I must see you, or die! You know you promised to come again to the camp!'

'I know I did, Mitha, but I acted as I thought for the best. I wished to spare us both the pain of parting!'

A faint, grateful smile broke over the wan features of the gypsy as Melville uttered the word 'both!'

'But you appear fatigued,' he continued. 'I fear you are ill. You can tell me another time—to-morrow—how you found me. To-morrow, I will ring the bell for the servant, she will conduct you to a room where you can get some rest, of which you must be much in need. I have no fear of your brother. He is hardly likely to come again to the same place. He is doubtless miles away by this time, searching for you!'

The Zingari turned a pensive and sorrowful look on Melville. 'You are not angry with me? I did so wish to see you!' The next instant an almost angry flush spread over her beautiful face. 'Oh, why did you come to the camp? I was happy till you came!' A passionate flood of tears, the violence of which she hid her slender figure like a wind-trembled willow, served somewhat to sober her excited feelings. Then, as a deep blush suffused her face and neck, she exclaimed eagerly 'Could I not stay with you as your servant—your slave—anything rather than remain here? I dare not return to the tribe!'

And truly, as she spoke, her watchful eye detected the sound of cautious footsteps on the gravel path beneath the window, and in another moment a man in her entrance the room.

'It is Orlando!' With a look of fond and hate upon his grim and pallid visage, he dashed himself upon Melville, and the dagger which glitters in his right hand has come down with deadly effect—and in another moment the assassin is gone.

A mercenary, shrank through the house, and as the frightened inmates enter the chamber, they behold the lifeless body of the hapless gypsy girl in the arms of Melville. She had cast herself between her brother and his victim, and had received the fatal blow. Her last dying

gaze was fixed on the countenance of the man she had loved, and whom she died to save!

Frank Melville is now a prominent artist. He has never married, and is likely to remain a bachelor until the end. His adventure with the gypsies is engraven on his heart and mind in characters which death only can obliterate. The place of honour in his studio is occupied by a large picture, painted by himself, of a beautiful female of eighteen summers in the costume of a gypsy. When any one inquires as to the name and origin of the subject, he replies in a tone which discourages further questions: 'She was an Italian gypsy.'

# A LILLY EVENING

THE twilight shadows falling fall  
O memory! how sweet thy final  
My heart's desire, all is vain  
Yet when I think of thee, my mind  
I cannot silence if I will,  
The softly falling rain

At such an hour, on such an eve,  
Thou art to me, that yet I only grieve,  
When up to fate and I come  
Ah never more hand clasped in thine,  
Shall we within the doors of dawn,  
And watch the falling rain

Yet still the memories of that hour  
Return with all our mortal power  
Of mingled joy and pain,  
When, dropping down from winnowed leaves,  
Our only falling on the leaves,  
I hear the summer rain

O cruel Memory! thou to being  
That glad brief hour, with better things,  
Back to my heart again,  
Thou partest, and is of fond regret  
With glad pretext, love hugging yet,  
Unmindful of the rain

Ah! brief, indeed! poor actress, heart,  
The joy thou seek'st upon impart,  
That follows in their train  
May say my heart, take up with it  
O cruel Memory! thy sting  
Shall vanish with the rain

Though milder seem the songs I tell,  
Yet sorrow, with its plankton thrill,  
Adds sweetness to the strain,  
As fragrant perfume softly flows  
From hazy blossoms bending low,  
Beats down thy wind and rain

## A PUBLIC BENEFIT

In a former paper (*A Safe Investment*, July 8, 1888) on the subject of Life Assurance, we drew attention to the inestimable blessing of being able to make adequate provision for future possibilities, and to the increased comfort and happiness of the man who has thus secured them dear to him from want and misery when deprived of his support. So far, we have dealt with this question of Assurance from a purely personal point of view. We now propose to enlarge our range of vision, and see what effect a more general appreciation of the benefits of Life Assurance would have upon a Community.

Much of the wealth of any nation will depend upon the amount of productive industry it possesses, and this productive industry needs stimulus for the development of its capabilities. As long as a people content itself, as in uncivilised countries, with merely providing the necessaries of life, so long will that people remain poor and helpless, but in proportion as men see and feel the advantages attached to industry, will be their efforts to secure those advantages for themselves.

The advantages we are now dealing with is one which can only be attained, by a large majority, as the result of thought and industry. The man who wishes to secure himself or his family from want in the future, will need to put forth his best energies in the present. Were this happy state of things in any sense a rule in our midst, there need be no fear of falling behind our neighbours, even where their natural advantages would seem to be greater than our own. But however patriotic we may be, there is little chance of our doing our best for the good of the nation alone, and one of the highest inducements to the thinking man to make the most of himself should be the reflection, that if he fail to put his shoulder to the wheel in good earnest, it may mean incalculable suffering to those he loves best, when he is taken from them. Unhappily, the tendency

of most men is not to do the largest possible amount of work without some very decided and powerful motive, and such a motive, to the man worthy of the name, will be found in the hope of securing a comfortable future, as well as a happy present, for those whose welfare depends so greatly on his exertions. Thus stimulated, he will be more than willing, even anxious to make the most of his time, and in proportion, trade will flourish.

Another national benefit derivable from Assurance, as affecting our habits of prudence, forethought, and industry, will be the lessening of taxation whilst giving increased power to pay. Is there any man who at some time or other does not feel as a heavy burden the weight of those terrible 'rates and taxes' which add so seriously to the year's outgoings? And yet, were the practice of Life Assurance, for which we contend, more generally diffused, there would be a vast reduction in two very important items to be found on our present rate papers, namely, poor rates and the cost of repression of crime. As to poor rates, no one who has come into personal contact with the poverty-stricken, or who has taken the trouble to investigate the causes which bring so many applicants for parish relief, can doubt the fact that the vast majority of suffering of this order arises from preventable causes—causes, moreover, to which, in the main, forethought would have dealt a death blow. Overcrowding of dwellings is one of the fruitful sources of illness, with its consequent train of poverty and wretchedness. But if evil habits grow and increase, mainly determination has a leaven of its own, and has a distinct tendency not to be content with doing its work in one direction only, but progresses from improvement to improvement. So, in the present instance, a man who has secured an Assurance policy on his life, and finds he is able to keep up his annual payments by the exercise of economy and thrift, will soon be disconcerted in finding himself cramped and unconvinced for want of better house-room, and the chances are that he will set to

work to improve his surroundings by a further course of forethought and industry.

The question of intoxicating drink was touched upon in our former article on this subject, but it is really impossible to get anything like a approximate estimate of the amount of poverty as well as of crime, induced by its over indulgence. Many a man, and, also that it should be so many an educated man, has been, under its influence, reduced from comfort and respectability to utter degradation and misery, and many a broken hearted wife has wept tears of agony, as one after another of the throng she loved, has with much pride to furnish her home, has gone to feed the demoniac appetite of him who promised to "love and cherish" her. Then, perhaps she makes desperate efforts to keep up the home and to find bread for hungry little ones, but more than this she cannot do, for anything the pawnbroker will take in return to go to feed the fit of the drunkard's thirst. But in course of time, when bodily health fails, she and her may be found seeking for admission into that workhouse, at the idea of which she used to shiver, and wonder how people ever came down so needing such help. But our friends may only too well know the love of drink has power to drag its victims down to almost unbottomed depths of sorrow and shame.

Now, all this cruel suffering and final coming upon the parish might have been prevented, had the husband the hour hold grasped the idea of his responsibilities, and by due exercise of his pecuniary means provision for all his wife and children. If up to his eyes in the hell for the servant, she will instruct you to a woman's duties of duty, of duty and children. Had he given the least anything approaching proper consideration, he could not have failed to see that to rely on self indulgence the money that, wisely used, would secure a comfortable future for his dependents, could scarcely be called by a lighter name than that of deliberate villainy.

That the above sketch of the life of a drunkard's wife is no fancy picture, thousands could testify, and even where the family does not go into the house, there are many ways in which the parish is made to give relief, which, with only ordinary prudence and industry, no such help would be needed. As an instance of the under hand way in which parish relief is obtained, take the following case, well known to the writer. A strong, able bodied man, the father of three or four children, could work only two or three days a week, and spent the rest of his time between drinking and sleeping, his delicate wife being left to feed and clothe herself and the children. One of the little ones sickened and died, and when the question of burial came, the father absented himself for a time, in order that the wife might be buried. Of course, the child had to be buried, and the funeral added one more item to the long list of that sort of parish relief which would neither be asked nor given but for the indulgence of evil habits.

It is not un frequently urged that sobriety is desirable were it for nothing else than the relief to poor rate and the diminished cost of expending crime that would ensue. And yet, another side of this argument has recently been brought into prominent notice. At present there are

thirty-one millions sterling of our national income derived from excisable liquors, being more than one third of the whole national revenue. Of course, any reduction in the income from excisable liquors, would, even under the most advantageous conditions, require to be made up by increased taxation in other directions. The first argument for sobriety, therefore, does not bear so much upon any slight saving to the taxpayer as this might cause, as upon the increased purity and happiness of the people that would follow from it. It is the moral evils that should be kept most prominently in view.

Putting aside the question of drink, there is frequently amongst the poor a lamentable want of anything like proper provision for the future. It is not unusual to find that the income has not been looked at in any way, or even when it has, that the provision made will little more than cover the expenses of burial, and in consequence of this, the number of widows and orphans who annually claim parish help is very great. Yet there is no real reason why matters should stand thus, the poor man in regular work should be as well able to provide for wife and children as the richer man for his. Of course, then a wife will be in position to take a proper measure of life, and in this proper measure it would be well if each labouring man could be compelled to make the all important provision perceptible would be the difference in our position.

But in so writing of the poor man's improvidence, we do not lay any imputation to lay a burden of blame on his shoulders at all. His mind is much taken up with his daily work, and he is not able to give him the leisure for the kind of reflection which tells us usually to the future. We think, however, it should, therefore, be the care of the man who has time and brain at his command to seek to instruct his less privileged brethren as to how to make the most of what he has, and to do this in such a way as to be able to provide for the future. But in order to teach, it is absolutely necessary that practical shall accompany precept, for it will be little use to tell the poor man to cut in his wife and children, if the instructor's own family has not first been secured from possibilities of preventable evil in the future.

And such is the heavy burden caused by a drinkable expenditure in regard to the poor, still another is that other heavy item of "prison, reformation, and police force." A very little reflection will show that all causes which affect the one affect the other, and, in fact, the root of the matter in both cases lies in the greater prevalence, within certain limits, of bad and evil habits. The most patriotic of Englishmen can hardly claim for his countrymen the merit of being a provident people, and unhappily we are in the main content with our improvidence, and do not trouble ourselves to consider to what very serious evils it may and does lead. We venture to say that not a tithe of those who shake their heads over our gigantic pauperism and our huge prison system have any idea of how closely these acknowledged evils are connected with that want of forethought and forethought, which, though perhaps equally acknowledged, is, as a rule, passed over with the slightest possible notice. Yet, take

the case of a man of right principle working his way back at whatever labour falls to his share, making the most of his earnings, and at the same time securing comfortable provision for the future. It is impossible to picture such a one applying for help from the parish. And it is quite certain that as far as he is concerned, there will be no need of taxation on the score of ignorance of crime.

Now, what is true of the individual is equally true of the community at large, and nothing will permanently diminish the number of crime but the wider spread of good habits and right principles. It need hardly be said that a man is not living up to this ideal whose thoughts go no further into the future than the present, for daily wants, and who fails to reflect on the fact that in the last winter, say at any moment he might be removed to the pauper's sufferer, or a family left destitute.

Looking at the many advantages we have thus secured, both to the individual and to the community, from the practice of Let Assurances, there is no room for wonder if the way in which it spreads when its value is once felt, but on the contrary, the mind is filled with astonishment that this boon is refused or neglected by so many, and we venture to hope that the more the subject is discussed and brought before the notice of the public, the more will men be found willing and anxious to avail themselves of what may well be described as a Public Benefit.

## ONE FALSE, BOTH FAIR.

OR, A HARD KNOT

(CHAPTER VII.—THOSE WHO WERE LEFT BEHIND)

THE carriage having rolled away on swift wheels from before the portico of Castel View, the two ladies who were left behind looked somewhat wistfully into one another's faces, the younger timidly, the elder with a pining tenderness that perhaps had never till that day and hour defined the proud eyes of Lady Barbara Montomery. These long deep down, solemn discords of by-strangers, in the hearts of most women, even the coldest and the haughtiest, a well spring of motherly kindness, that was but the truth of the man's mind to let loose its nature.

"I am very sorry, my dear—very sorry, Clue, for you," said Lady Barbara in a low voice. "Thank you, dear aunt, your kindness is all."—And then the voice of the youthful speaker was choked in her emotion.

The sympathetic aunt of the late Marquis looked almost apprehensively around her, as she came what stillly extended her strong, bony hand, to give support to the slight delicate form of the half-fainting girl that nestled by her side. "The servants!" There were several, only too many, of them present, and it is a golden rule and canon of conduct with members of that higher aristocracy to which Lady Barbara belonged, that all unbecoming manifestations of emotion must be concealed from those who eat our bread and wear our livery. Lady Barbara's own idea of the proper demeanour of a grand gentleman, and still more of a great lady, such as a Marchioness

of Leominster, was probably very much akin to the stern sternness of those Red Indian warriors who bear the bitterest remnants which their captives can inflict with a scornful composure that laughs at pain. But all of us are not of the same heroic mould, and Lady Barbara felt more compassionate for her fallen companion.

"Clue—my poor, dear Clue—come with me—come to your own room. They have been ready for you, early and waiting for days past, and Lady Barbara, with a wonderful attention, for her, and she who was addressed thus, permitted herself to be led away. Of course the servants did not stir, nor did they whisper to one another, it was well to understand in the great marble hall of Castel View broke up, like so many willows when the bark has curled the willow will wither, and footmen, valets, gentlemen of the chamber, dispersed. But servants have terribly sharp eyes where their employers are concerned, and Lady Barbara had not the slightest doubt that the young Marchioness, the daughter-in-law of her aunt, the sudden dispute between the sister, the abrupt departure of one of them, the agitation of the one who remained, would be discussed, and discussed loudly, cranked, weighed, and criticised in servants' hall as still room, until the subject was worn threadbare. It could not, she who was a stickler for propriety, and who could do as she would go, or newspaper title concerning recent members of her own order, because it gave occasion for her worldly pleasure to speak evil of dignities. At least—there was one comfort in that—even if it was, painted fall of tongue, as in the days of the old Elizabethan drama, could not in very death of accurate or minute information, but unwilling positive to say that would detain it in the custody of the great House of Montomery Leominster, of which the headquarters were at Castel View.

The rooms that had been put ready for the widowed Marchioness were sumptuous and spacious, and disengaged the famous firm of decorative upholsterers who had sent in the rich furniture, and done all that could be done, in a tasteful way, to make a better worthy of William's beautiful young wife. The more the very appointments that had been prepared, but a few short months ago, so it seemed, for the reception of the bride, and now—

"I feel more wretched than before!" exclaimed Lady Barbara's youthful companion. "Poor Lady!—it seems but yesterday, and now, it is gone, and—and—" But you will think me foolish!" she exclaimed, while the distracted housekeeper who stood there looked extremely embarrassed, and Lady Barbara, abruptly, and Fennett the travelling maid, threw adieu-long glances at each other.

"Not foolish, dear Clue," replied the chambermaid of Castel View, very gently, and then turned her eagle back and bushy eyebrows towards the servants—"Lady Leominster is laid after her journey. I will stay with her, Mrs. Blon. When your, her maid, the Marchioness's maid, can come."

Mrs. Blon the housekeeper made her reverential courtesy as she and Fennett retired.

'I am so sorry—but to the heart—for you, my poor, poor child!' said Lady Barbara, when these two were left alone together, as she folded the young girl in her arms.

Very prettily, very gracefully, did the slender girl submit to that care. 'I shall do very well, dear, good, kind Aunt Barbara,' she said, in a voice that was almost steady. 'Your great kindness, your noble strength of principle and purpose, seem to give me strength—to me, who need it so much,' she added plaintively. 'At first, just at first, the memories that these dear rooms called up—the recollection of my darling Wilfred—were almost too much for my poor powers of endurance. But it is now—my own, loved, unguarded sister, that!'

Lady Barbara dismissed indignantly with her large well-shaped foot upon the soft carpet. 'It was a wicked, wicked attempt!' she said, almost as a soliloquy might speak.

But her voice was audible to the quick ears of her fair companion, who exclaimed eagerly. 'No, no, dearest, good Lady Barbara! Do not call Cora wicked, for my sake. I know her—my twin sister—and indeed, indeed she is good, and I love her, and grieve over her sin, and—Am I wrong and harsh in calling what has happened a sin, when I speak of my own sister?' she asked pitiously, and with an appealing, hand half uplifted.

Lady Barbara, who was a head the taller of the two, bent slowly and kissed her. 'You are a noble girl—too good for this world, with its hollow shams and base deceptions,' said Lady Barbara, whose eyes were dimmed by actual tears. 'Yes, it was a sin, yes, it was mean, vile, mercenary—what I never thought possible on the part of any one who, like Miss Ouse, although a commoner, was—'

'Oh, I do,' interrupted the girl, 'between my poor Cora and myself there has been more reticence, less frankness in our intercourse. My sister has seemed to me to be always pre-occupied, always on her guard. I have feared—'

'Dear Lady Barbara, may I speak my mind to you?'  
Lady Barbara smiled her cordial consent. Even a normal share of feminine curiosity would have insured her as a willing listener on such a theme. But the root principle of her life was loyalty to the great House from which she sprang, and nothing which affected the honour or the prosperity of the ancient Montgomerys could fail to interest her. She may have thought, nay, had thought—that her late nephew, the Marquis, had been carried too far by his admiration for a pretty face. Falconer, so held Lady Barbara, should make with falcons, and a mere baronet's daughter, and—for nobody is quite so consistent where cash is concerned—the daughter of a quasi bankrupt baronet, was scarcely a fitting Lady Paramount of Castel Vaux and the great estate that the old lords marshalled, her own father, had held from the Crown by tenure of lance thrust and sword stroke, as became their wardenship of the wild Welsh border. If Clara Ouse had but been a Lady Clara, sprung from one of those pushing families that our English Elizabeth loved to promote from the fast civic cap to the Earl's coronet, then indeed would Lady Barbara have been satisfied, but as it was,

she had to make the best of the situation. And yet, the widowed bride was beautiful, gentle, and winning, while there was something pitifully clear in her helpless need for protection.

'My poor sister,' resumed the girl, in a faltering voice, 'seemed changed, strangely so, from what she had been when we embarked on board the *Cypres* for our sad voyage home. Among our fellow passengers was a person—a lady—a foreign lady of title, whom we had known, when far up the Nile, before my dear husband's death. I do not like to say that Madame de Lalouve—Comtesse Louise de Lalouve, she called herself—forced her acquaintance upon us. But she rendered us some little service. She had special privileges from the Egyptian authorities, knew the country and the languages well, and was a bold, experienced traveller, quite unlike us to, timid English girls, and hence we were almost in safety. There was something fascinating, I confess, about her manner, and her conversation was very amusing, for she seemed to have been everywhere and to know every body.'

'I dreamy she did,' responded Lady Barbara, with an expressive tightening of her firm lips and an expressive arching of her black eyebrows. Lady Barbara had never been far travelled. She had been shown Paris and the Rhine and the lakes of Koenigsberg, in her gaily father's lifetime, and she had not approved of Paris, had considered the Rhine a lug, overrated river, and regarded the lakes of Koenigsberg as a pond without merit. She had a very contemptuous opinion of foreign conversation in general, and was by no means predisposed in favour of Comtesse de Lalouve.

'I shrink myself, perhaps instinctively, from our foreign friend's society,' went on the other, 'but Cora, my poor sister, seemed to find some fatal attraction in the woman's pernicious company. She—Comtesse Louise, I mean—had a perplexing way of talking, half in jest, so as to make wrong appear right, and to confuse good and evil, and this, with her sudden appearances and disappearances, and the fact that her very nationality was a puzzle, combined to earn for her, in Egypt, the nickname of the Sphinx. Somehow, Cora was always talking to her, and used to quote her opinions and sayings as though she had been an oracle indeed. During the passage to Southampton the conversations between Cora and the stranger were very frequent, and—I hope I am not uncharitable in saying, that to the counsels of this dangerous adviser may be perhaps attributed the dreadful result, which at last urged Cora—dear young Cora—to—'

Here she had her face  
And Lady Barbara, with honest indignation, struck in. 'Of course it was! The miserable girl has let her weak head be turned by the vile promptings of the wicked adventures—French women, Russian—which did you say?—Yes, I see it now. It was no madness, no despair, but a plot, a base, cowardly plot, to rob a sister of her rank and her inheritance, of all she owed her dear dead husband!'

'Not all, Lady Barbara,' sobbed the girl. 'The memory of his love, the recollection of his tender kindness—of those, no subterfuge could—ever—have deceived me.'

Then Lady Barbara took the young girl in her arms, and kissed her, quite in a motherly way, and benevolently recollected herself to the choice that her noble nephew had made. 'You are one out of a million, my dear, and my poor Wilfred was quite right to love you as he did—quite right!' she said, in her energetic way. 'You have been shamefully dealt with—shamefully! Luckily, when your sister made her audacious statement, Mr Pembroke knew it, who has so long managed the law business of the family, was here, and I too, who have seen too much of the world to be very easily deceived. But you will be ill, dear child, with this excitement, and indeed you have had neither rest nor excitement since you came among us—a sorry welcome to Cretal Vaux. Let us avoid exciting topics, such as we have been discussing, for the remainder of the day, and—'

'I must win her back. I will wait—I will plead with her not to reject my love. I must wait, Aunt Barbara!'

Lady Barbara looked grim. She was one of those who very much prefer that a matter should suffer for its size—that the taste of ashes, so to speak, should be hot and bitter to the mouths of those who willfully prefer Deal Sea apples to wholesome fruit. But she made a concession. 'Well, (lure!) she made answer, 'you shall wait, of course, if you please, and I will wait too, to the brother and natural protector of this young lady. No doubt, if she repents her decision, she is promised him, and no doubt, too, in an hour or two, you will make provision for her comfort, so that she should not be a mere prisoner on the too scanty income of your brother Sir Philip. But you will see yourself afterwards, when you have time to reflect calmly on what has occurred, that Miss Carrow is scarcely better a slave or an appropriate companion for the Marchioness of Leominster.'

'I want to win her back,' was the plaintive rejoinder. And for the time being, the subject dropped.

Then the bell was rung and the servants summoned. There was much to be done. A Marchioness of Leominster, a mistress of so magnificent a house as Cretal Vaux, is among the great ones of the earth, and as such, does not quite belong to herself, but is a necessary and imposing portion of the social machinery which befits her rank and station. Trunks had to be unpacked, and wardrobes untried by deft fingers, but this was a mere matter of detail only, it slowly got through. Then tea was prepared in the Parlor Room, so called—marvel of Parisian wit and taste, and soft unblended mixture of cream and pink and gold. Of rare art, too, were the embroidered trays on which were the pretty, costly toys of the terrace, every one of which had been a loving study for a painter worthy of most celebrity than the daintiest touch-up can afford. Presently there was the ceremony of dressing for dinner, wherein Fennet had the assistance of a new, younger, and perhaps over-zealous maid, whose high-spirited spirit had been the means of a belated admission, and who had come to learn the difference between Sir Peter Pample's daughters and a real Marchioness, and was therefore anxious to justify her position.

Lastly, there was dinner—a meal which, under the circumstances, was about as cheerful as a funeral feast in ancient Egypt. There was something almost picturesque in the appearance of that vast solemn dining room, with the grim array of historical portraits on the walls, long dead ancestors and ancestors, in armour or in cloth of gold or robes of state, in ruff and fardingale, in hoop and astir maque, flowing or smoking from the canopies on the present occupants of the great gloomy banquet hall. There was but little talk. The most pertinent of remarks would have felt his spirits damped by the surroundings, and Lady Barbara checked little beyond necessities from her conversation, who indeed seemed somewhat awed by the sombre splendor that surrounded her.

'I am so tired,' said the four inmates of Cretal Vaux, rather tamely, after dinner, and it was not very long before the wished Lady Barbara good night, and retired to her own apartments, dismissing as early as she could the attendance of her maid. One by one, the lighted windows in the great Border castle grew dark, and only the clear pure moonlight shone upon the grey monastery and the many windows, and all was hushed. Perhaps the last to be shut in Cretal Vaux was the newly returned traveller herself, who, while others slept, stood long, unwearying, at a window of her room which commanded a glorious prospect of mountains, streams, and a red. 'A great prize, she murmured unconsciously, as her eyes bade adieu for the night to the sun and its light—'a prize worth keeping.'

## THE SOLAR CORONA.

When a moderately magnified image of the sun, suitably darkened, is thrown upon a sheet of white paper, the centre of the disc is seen to be brighter than the edges. This fact, strange to relate, was not easily recognised. Galileo distinctly says that the image appears 'equally bright in all its parts.' Lambert also held the same view, adding that 'there is no person who does not admit this fact.' Bunsen, the inventor of the heliometer, was the first to dispute it. He found that the eye might be incapable of detecting the real difference in the luminosity of the same surface, owing to its immeasurable extension from the centre to the edges, and in order to put his idea to the test of direct experiment, he isolated the centre of the solar image, and also a portion of equal extent near the border, and compared them. The measurements degrees of brightness being thus got rid of, the relative dimness of the border region became at once apparent. The conclusion arrived at by Bunsen was, that 'the brightness of the central portion of the sun is to the brightness of a portion situated at three-fourths of the radius, measured from the centre, as forty is to thirty-five.' With slight modification, this conclusion has been adopted by Laplace, Sir John Herschel, Airy, and other modern astro-

But if certain evidence other than that obtainable by photometric methods be wanted, it is to be found in the results of photography. Photographic pictures of the sun unmistakably show a shading off towards the borders of the solar disc.

Now, this circumstance is not without its important significance. Of course, the center of the sun's disc is slightly nearer to us than the edges, but any difference of brightness due to this cause must be totally inappreciable. The fact of the human eye minutely observing as it does can only be due to the absorption of some of the rays by an impenetrably transparent envelope. The reason of this is obvious enough. The rays of the moon, when overhead, have to pass through a smaller extent of our atmosphere to reach the eye of an observer, than when the moon is near the horizon, and, naturally, the eye of the observer has to penetrate a thinner layer of air in the former case than in the latter. So with the sun. A solar beam emanating from the center of its apparent disc has upon its way to the eye of a moon that is right overhead and a beam from his extreme edge, to a moon on the horizon, and if we suppose the earth to be in the latter position, the beam in the latter instance runs a far greater chance of being absorbed than in the former, having to pass much further to travel through the absorbing medium. An observation shows that more rays are absorbed near the borders of the disc than in the center, producing a corresponding diminution of light, it is not merely inferred that in invisible solar envelope, or atmosphere, does exist, and that its nature, whatever it be, is such as to make it impenetrable to light.

As every day shows, a solar eclipse is produced by the dark body of the moon coming between us and the sun, and so intercepting his beams. When a total eclipse takes place, the moon entirely covers the sun's disc. Hence, on such occasions, we should expect the orb to be blotted out of the sky at the time being. But as a matter of fact it is not so. The black moon is seen superimposed upon what we ordinarily regard as the sun, but all around the solar disc, a bright glory of light is visible, extending far out from the edge, and thus giving rise to a relief to the body of our eclipsing satellite. What is this light? It may be one of two things. It may be a lunar atmosphere brilliantly illuminated by the sun behind, or it may be a solar atmosphere, of inferior brightness to the sun himself, which only becomes visible when the superior light is withdrawn or concealed.

That it is not the first, we have abundant proof. Leaving out of consideration the many evidences that the moon has not an atmosphere of appreciable height or density, we have the circumstance that the glory in question, when the lunar and solar discs do not exactly coincide, forms a pretty uniform fringe around the latter disc, quite irrespective of the position of the former. The inference is unquestionable. The fringe of light belongs to the sun, not to the moon. Is it, in fact, the corona, or coronal atmosphere, whose existence we have already been led to infer from the apparent case of the sun's surface.

Respecting the nature of this solar appendage, we know but little. From its shading effect upon the solar disc, we gather that it has the power of absorbing light, but anything more than that we are not warranted in assuming from the phenomenon. Then its luminosity is so faint—compared with that of the sun—that it is only visible during the totality of an eclipse, and eclipses are so rare, and of such extremely short duration when they do occur, that knowledge obtainable only while they last must necessarily be of slight value. On this ground, the approaching eclipse of May 6, 1882, is being looked forward to with unusual interest. Whilst on ordinary occasions the duration of totality is not more than one or two minutes, it happens that the conditions in May will be such as to favour a stretch of no less than six minutes. The opportunity will be exactly suited to put an end to the test.

But even while a fraction more or less is apparently waiting for this happy chance, the startling announcement is made, that a method has been discovered by which the corona may be studied independently of eclipses—from day to day instead of for a minute or two on rare occasions. The author of this important discovery is Dr. William Huggins, the eminent observer, who has been so successful in his application of the spectroscopic to the problems of celestial physics.

During the total eclipse of May last, which was observed by an English expedition in Egypt, Professor Huggins succeeded in obtaining a photograph of the corona's spectrum. The spectrum, it will be remembered, is the chemical band of tones produced by passing the rays of light through a glass prism. An examination of this photograph showed that the different colours into which the light of the corona was resolved by the spectroscopic were not equally strong—the violet end of the spectrum being considerably stronger than the rest. Now, as the light has a more powerful chemical action than either red or yellow. It is indeed due to the violet rays in sunlight that the process of photography is due. It occurred, therefore, to Dr. Huggins that this abnormal strength of what we may call the 'photographic' rays in the case of the corona—this point of difference between the light of the sun and the light of the corona—might be utilized to render the latter visible.

We have already said that the corona, except during an eclipse, is quite invisible to the eye because its feeble light is overpowered by the glare of the sun. Yellow rays are the ones which have the greatest luminous effect, and the yellow rays emanating from the sun are of the same relative degree of intensity as those emanating from the corona. Hence it follows that, so far as direct vision is concerned, it is impossible for the one to be distinguished from the other. Throw the image upon a photographic plate, and we have no better result. The light of the two is so nearly identical that the difference is not apparent. But step back a little and the test is made, and then we find the corona comes out in our picture, for, as we have seen, the violet rays are relatively stronger in the light of the corona, and these rays are the most effective in photography. That is Dr. Huggins's discovery. He splits the light of the sun and a

portion of the sky near it of the lens photographic eye, receives the image on a vitreous plate, and so gives a picture of the said scene.

Great improvements in the process will doubtless be made ere long, and with them, our knowledge of the wonderful hummy will increase, not by occasional hits and starts, as heretofore, but steadily and progressively.

## PICTURE STEALING

WARRIOR of Fri Angeles beautiful altarpiece in the Louvre, Mr. Luvion says 'It was painted for the church of St. Dominick at Puzos, where it remained till the beginning of the present century. How obtained, it does not appear, but it was purchased by the French government in 1814.' If the seller was a Frenchman, in all probability the picture had been stolen from the original owner. Napoleon the Great believed in the old maxim that all is fair in love and war, and had no compunctions about disposing his foes and vanquishing Paris to them as spoils, and although the cynic of that city by the allies ruthlessly entailed no little flummery of the treasures of the Louvre, its galleries yet held masterpieces of art that would not desert their walls at anybody's bidding.

What the Emperor did for France's profit, his generals did for their own. Dethroned carried off one of Murillo's many paintings of 'Our Lady of the Immaculate Conception' from the Palace of Madrid, which was afterwards sold by his daughter, and eventually found a home at the Hotel Sebastian purchased upon the Duke of Aland's to present him with a St. Thomas, but the Duke had himself stolen 'The Martyrdom of St. Peter the Dominican'—now at St. Petersburg—from the church of the Inquisition in Seville, being in its place a copy by Joaquin Coria. These were but petty larcenies compared with those effected by Marshal Soult in the carrying off of pictures. Lucky was the Spanish church or convent that escaped having its walls stripped of the masterpieces of this mighty connoisseur, who transformed the French War Office into a picture gallery, a gallery that would have been killed to extinction, had not the Duke of Dalmeida hurried despatch from Spain, under pressure from Wellington, compelled him to leave behind him some hundred pictures as a bribe for convenience to France. As it was, Soult's collection valued no less than sixty thousand pounds when brought to the hammer in 1872, a sufficient proof of his industry and judgment.

On one of his fifteen Murillos, the Marshal told Colonel Gurwood by no special value, because it had saved the lives of two very estimable persons. 'He threatened to shoot them if they refused to give up the picture' was an inadequate private explanation of his chief remark. This may have been the 'Our Lady of the Immaculate Conception,' purchased at the sale by the French government. While following Sir John Moore's retreating army, Soult captured two Capuchin monks, and instead of executing them as spies, ordered them to show the way to their convent. There he saw the Murillo, and asking what sum would buy it, was informed

by the Prior that a hundred thousand francs had been offered for the painting. 'I will give you as much again,' said Soult, and seeing there was no help for it, the Prior agreed to sell at that price. 'You will give me up my two brethren?' said he. 'Certainly,' replied the Marshal. 'If you desire to ransom them, it will give me great pleasure to grant you your wish, the price of their lives is two hundred thousand francs.' That it was that the lives of two estimable persons were saved by the Murillo, and a masterpiece bought without the buyer's paying a penny the poorer by the transaction.

Another of the Marshal's notable acquisitions was a Murillo belonging to a Spanish church, from which some person unknown had cut away the figures of the Madonna and Child. The missing portions were replaced by the work of a modern hand, and in this state the mutilated picture hung in the Saint Gildy until the dispersion of the collection, and then found a purchaser, who, by an extraordinary piece of good fortune, came some years later into possession of the long-absent Virgin and Child, and was able to make the picture perfect again. Where he obtained them, we are not told. In Mr. Saurin's *Annals of the Artists of Spain*, published in 1848, a Murillo belonging to an English gentleman is thus described: 'Our Lady standing with the Infant Saviour in her Arms. The picture is supposed to be the upper half of a composition representing the Virgin standing on clouds and supported by cherubs, of which Marshal Soult is said to possess the remainder, and to call it *La Virgen Coupée*.' If this was not the welcome 'find' of the Virgin Coupée owner, there must be another Murillo somewhere wanting the latter half.

To steal a picture is bad, to steal part of one is a thousand times worse. Soult owns many great paintings, but none on which his claims are so much more as their cathedral's colonial representation of 'The Apparition of the Infant Jesus to St. Anthony,' a *chef d'œuvre* bringing the artist ten thousand rials, and for which Spaniards at the Duke of Wellington vainly offered as many ounces of gold as would cover it, equal, it has been calculated, to the sum of forty two thousand five hundred and twenty pounds. On the fifth of November 1874, the custodian of the cathedral had the misfortune of discovering that some unknown ruffian had cut away nearly a quarter of the famous masterpiece, the figure of the saint having vanished from its accustomed place. A large reward was offered for its recovery, but the thief had not dared to attempt disposing of his acquisition in Europe. He went farther afield. One day, a Spaniard, calling himself Fernando Garcia, waited upon Mr. Schae, a well known picture dealer in New York, and announced his anxiety to sell a treasure of art that had been in the possession of his family for many years. The precious heirloom proved to be an oval painting about seven feet high, tacked to a stretch of indubitable American manufacture. Mr. Schae asked his visitor to put a pane upon it, and obtained the missing St. Anthony for two hundred and fifty dollars; for which sum he transferred it to the Spanish consul. Upon being arrested for the theft, Garcia

protested his innocence, and declared he was ready to return to prison, to clear himself, a bold offer, considering the story which had told Mr. Belcher. He would seem to have known what he was about, for, being sent to Spain by the same ship as the recovered runt, he was set at liberty by the authorities, and never was heard of more.

England has never suffered the humiliation of seeing her museums and galleries rifled by a foreign soldiery, her own people are unserviceable for any art-lover she has sustained. When Charles II. came home to enjoy his own, he found much that was his own by right of inheritance had departed. Some of the Whitehall pictures had found new quarters in the Palace of Madrid, others had been purchased by noble collectors at home, and, at Christopher Clapham did not let Secretary Nicholas, Lady Temple helped herself to one of the queen's pictures. Your admiring, this dilettante that was betrayed by Catherine of Braganza, who, returning to her native land, carried off with her several pictures that had taken her fancy, among the Lord Chamberlain's mouth by giving him one he especially desired to possess.

We do not find another case of picture stealing in England until the middle of the present century, when a number of paintings mysteriously disappeared from the Earl of Carlisle's residence at Charlton Park. This was in 1808. Writing of the event, the present Earl says: 'The stolen canvases were hidden away in London—one, the gem of the collection, behind a picture in the War Office, where the thief, who had formerly been valet to my father, held a situation as clerk. The picture was eventually recovered by advertisement, which happened to meet the eye of a dealer who had purchased one of them, and was in twenty-four hours. When the thief arrived with the second commitment, he was promptly given into custody, and was ultimately executed seven years' penal servitude. He said at the trial, that whilst in service at Charlton he had heard much talk of the immense value of these pictures, and he expressed astonishment and regret at the want of appreciation displayed by the traitor, when such works of art were submitted to him. The one he had sold—a small Leonardo—had realised only eight pounds.'

One of the trade showed he could appreciate a notable picture by paying ten thousand guineas for a Gainsborough, as to the guardianship of which artists and connoisseurs were alike divided in opinion. The painting so well sold in 1876 was a nearly whole-length portrait of the Duchess of Devonshire, said to have been purchased by a picture dealer for fifty pounds, and sold again by him to Mr. Wynn Ellis at a profit of ten pounds. Mr. Agnew had good reason to repent his bargain. It had been in his possession less than a month, when it was cut out of its frame while on exhibition in Messrs. Agnew's Gallery in Old Bond Street. The picture was safe when the Gallery was closed for the night, but next morning the frame was hanging empty in its place, with the stretchers, denuded of canvas, lying in front of it, and the fate of 'The Duchess' is a mystery to this day.

Imitated possibly by this successful though profitless theft, a workman employed at Lancaster Gate served Cooper's 'Monsieur of the Meadows'

in Mr. Allcroft's collection there, in the same uncharacteristic fashion. Cooper's picture, however, was ultimately restored to its owner, and the purloiner punished as he deserved. A clever rogue robbed the collection of a Viennese connoisseur of a sixteenth-century portrait of a Dutch Admiral, much valued by its possessor. He offered a reward for its recovery, and was waked upon by a stranger, who, after some bargaining, agreed to see that the picture was restored, upon the reward being paid and no questions asked. Once more the Bologna graced the happy man's wall, but, alas! a friend, on making a close examination of the restored picture, discovered it to be but a clever copy—for which the owner of the original had paid a hundred and twenty pounds.

Again and again have picture thieves proved too cunning for the guardians of the Dresden Museum. In 1747, three pictures disappeared simultaneously from its walls, one of which, by Marie, the printer who valued his library at a duck in the house, was subsequently restored. Forty-one years later, the authorities were under the necessity of offering a thousand ducats to whomsoever would loan, but a portrait by Bayböl, 'Christus', 'Rising Madonna', and 'Van der Wijk's Judgment of Paris'—a painting less than two feet square, valued in Smollett's Catalogue at five hundred guineas. In due season, a box was found, near the entrance, containing the missing pictures by Bayböl and Van der Wijk, a discovery followed by the apprehension of the thief, a man of bad reputation, named Wagner, and the finding, under the arm, of a bagful of the stolen pictures. Which had been removed for the sake of the gold and precious stones with which it was decorated. In 1810, the gallery was robbed once more—the time, of a small picture in the style of Holbein, which has not been seen since. In the hope of baffling such depredators for the future, in attention was made in the method of hanging the smaller pictures, an alteration apparently unnecessary, for the purpose, for no more thefts occurred until 1849, when Sophia von Langenscheidt carried off a little gem of Mantegna in broad daylight. She had the security to offer her pawn for sale at Leipzig, but the work being recalled, she was sent to Germany, and the victim of commerce hark to the old quack.

The famous picture dealer did her evil work unaided from within. How could naturally have been the case with the bold thief or thieves who within the last two years entered the Royal Palace at Brussels and not only carried off a quantity of jewellery from the queen's apartments, but had sufficient time at their disposal to visit three salons in turn, and cut out of their frames Madou's 'Quarrel in a Pathos', Van Regemortel's sketch of an old man and a young girl holding a parrot, and Robert's 'Crisp in Egypt', and 'View of Assam', getting off with their spoils, spite of lookers within and soldiers without. The pictures so cleverly abstracted are familiar to thousands, and could not be bought by any one with money. What will the thieves do with them? Are they destined to be lost for ever? or will they some day come again to light, like Raphael's 'Holy Family'?

found, in 1876, by a peasant of Lavagnoli in a loft, and used by him to keep the wind from blowing through a broken window, to be rescued by an observant connoisseur, who, on examining his acquisition, found that the frame bore the arms of the Rovere family, and rightly inferred therefrom that the picture had at one time or another been stolen from its proper owners.

## FOR HIMSELF ALONE

A TALL OF REVISED IDENTITY

CHAPTER VIII

CLIMBER and Captain Dyson were quite content to find themselves out of sight and hearing of the rest of the party. Never before had the Captain had a listener as close as intimate and no appreciative ally, Mrs. Fawcett was a most superior young woman, with intelligence and tastes far beyond the ordinary run of ladies.

They had been assembling up hill, and conversation had been an impossibility for the last few minutes, but now, having reached the summit, they sat down to rest on some low bushes, and the Captain resumed the thread of his narrative.

"When I came to my senses," he said, "I found that the natives had bound me fast to the trunk of a large tree about a dozen yards from their encampment. I knew but too well the fate in store for me. On the morrow I should be tortured, if not, I should be killed outright, and after that I should be served as I wished up hot for supper."

"O Captain Dyson, how dreadful was your situation!"

"Still I defy the rest of my misadventure till another day."

"Please, sir, I am dying to know how you escaped, for you did escape, of course, or else you could not be here to tell me."

"I did escape, Mrs. Fawcett, but you would never guess by what means."

"Do not keep me in suspense, Captain Dyson." The sun set, the camp fires were lighted, and still I remained fast bound to the tree. I thought of many things—much to think of many things at such times. I thought with a pang that I should never again see my native land, my dear old England. And so I thought, then, my patriotic feelings awoke within me, and would not be controlled, and I began to sing *Rule Britannia* at the top of my voice. In the next day I was considered to have taken a fine tenor voice. I lost it subsequently, when laid up with a cold among the African swamps."

"I should dearly love," have heard you sing me, on that memorable night."

"Before I had reached the end of the first verse, there was a general movement among the natives. They sprang to their feet, and with loud guttural cries they came trooping towards me—men, women, and children. They surrounded me, and as I went on singing, there was the deepest silence among them. Even the babes in arms hushed their prattle. They had never heard anything like my singing before."

"Ah, no, I can quite believe that."

"By the time I had reached the end of the second verse, they were all in tears."

"Your sweet home was a happy one, was it?"

"I was in the middle of the third verse, when the old chief came up to me. He was sobbing. He seized me by the shoulders, and rubbed his face violently against mine, which is their way of making friends. Then his two daughters came and rubbed noses with me. I was allowed, and carried in triumph to the chief's hut. I sang to him all that night and all next day, then he said that he had had enough for a little while, and ordered me his daughter in marriage."

"O Captain Dyson! But you did not marry her?"

"Could you believe in the possibility of an English gentleman marrying the daughter of an African king?"

"So likely I should be to her father," I declared of their son that old man Mr. Drummond coming there," she exclaimed in a tone of astonishment. "It looks as if he had allowed us an jump."

To return to Mrs. Fawcett. "At 10 my eye had not been more than a couple of minutes, when she was startled by seeing a stranger coming towards her through the trees. As he drew nearer, she saw that he was a built, middle-aged man with thick features, that were set in a somewhat more of Greek head and monomachia. He was dressed in a suit of grey frock coat that had evidently seen better days, he wore a soft velvet hat, his thick-rimmed spectacles were white with the dust of country roads, and he carried a stout walking-stick in his hand. He came up to him, bowed his hat for a moment, and said, "Pardon me, but am I right in assuming that there is a private here today, and that my friends Mr. Drummond and Mr. Frothingham form part of the company?"

His voice was a very pleasant one, and so was his smile, as Miss had an opportunity of proving a little later on. Despite the stranger's homely looks and somewhat shabby attire, something whispered to Mrs. Fawcett that she was in the presence of no ordinary man.

"There has certainly been a picnic here to-day," she replied, "at which both Mr. Frothingham and Mr. Drummond were present. They will neither of them be very long before they are back. Perhaps if you wish to see them, you will mind waiting." She spoke with a somewhat hesitating colour, and the stranger's dark eyes rested on her face with a look of unobtrusive admiration.

"Thank you very much, he said. "If you will allow me, I will wait until their return. I am staying tonight at my uncle's in the village, and it will be my intention to walk over to Weyland—to I think Mr. Frothingham's house is called—in the course of tomorrow. He is, however, that my friends were so near me to-day, I could not resist the opportunity of coming in to see them."

"I have no doubt that they will be pleased to see you," answered Miss, not knowing what else to say.

"By the by, I ought to apologise for not introducing myself before. My name is Denice Layland."

'Mr Leyland!' exclaimed Elma with a start of surprise. 'I have heard both Mr Frobenius and Mr Drummond speak of you many times.'

'Ah! Then they have not forgotten me. I am glad of that.'

'Did you think, Mr Leyland, that either of them was likely to forget you?'

'Well, no—they are really the sort of men to do that,' he answered with a little laugh. 'But may I ask to whom I have the pleasure of speaking?'

'My name is Elma Deane. Mr Frobenius and I are cousins.'

'Mr Leyland will be glad to hear of this. I have just cut with two servants from Weyland's down up. They had come to fetch away the harness and other articles pertaining to the picnic.'

'Would you not like some refreshment, Mr Leyland?' asked Elma.

'Thank you. I should like a bottle of lemonade, if it is not too much trouble,' answered the guest.

He sat down on a fallen tree, and found himself with his hat white out of the servants opened the lemonade.

'With what lovely bits of genuine English scenery this neighbourhood abounds!' exclaimed a few moments later. 'They are it true a picture and a delight to a man like me. We pushed on our driving career after crosses from youth till age, and the older we grow, the more we feel how futile are our efforts, and how few of our secrets Nature has deigned to reveal to us.'

'There was one landscape in the Academy this year,' answered Elma, turning her eyes gravely on him, 'that any mind would instinct with some of Nature's sweetest scenes. The trees that started the tops of the larches on the hill seemed to fan my cheek as I looked. The cloud shadows that stirred each other in the corn fields in the valley were the very shadows that I have watched a hundred times in a child. Those secret pictures in the sun-land were the same that I gazed at as a young man. And yet, Mr Leyland, you know more of Nature's secrets.'

'But Leyland rose slightly. 'Let us walk a little way, Miss Deane,' he said, 'and find some things else to talk about.'

Elma picked up her sunshade, and the two strolled slowly side by side down one of the pleasantest roads in the valley.

'Can you guess, Mrs Deane,' asked Leyland presently, 'why I am more glad to die than I have been for a long time?'

Elma shook her head. 'It is impossible for me to guess, Mr Leyland.'

'I am glad to say I am the bearer of good news for my dear friend, Dick Drummond!'

'Oh!'

Not a word more could she say. Her heart fluttered, her colour rose, the painter regarded her with anxious eyes.

'Dear old Dick!' he went on passionately, almost as if speaking to himself. 'How pleased I shall be to see him again!—And Frobenius too. Noble-hearted fellows both. What smoke we have had together, what talks we have had together, how we have argued and disputed, and in the end agreed to differ! "Oh! golden hours that never can return!" No, *James, James!* He

quits the last words almost in a whisper. The two walked on in silence.

Like a certain noble poet, Elma Leyland awoke one morning and found himself famous. He had been a struggling man for twenty years, trying his hardest to win fame and fortune, but not succeeding in his pursuit of either. Now and then he sold a picture, but in order to make ends meet, he was compelled to pawn some thin he could sell. Now and then, a note of praise would be sounded by some critic, disdaining thus the rest of his tribe, but such notes were few and far between to materially affect the fortunes of the artist. One day, however, a transport came through England. A certain hotel was pointed to Leyland, into which he had thrown his whole heart and soul, came, by a happy coincidence of circumstances, under the eye of Mr Jackson the world-renowned critic. The morning took the critic note. 'Those towers, those bits of grey lightning upon rock, bones of a world of life,' wrote the great critic, 'that curving sweep of black, melancholy, wind-swept battlements, the lines of Solitude for ten thousand years, that far away fangs of low lying horizon, where the mountain creeps down the sea, land with clean light, pregnant with the sunset of evening dream, those brilliant, sun-washed masses of cloud, hurrying up the sky as if bound for some great meeting place of the world—all these, I say, could only have been depicted by a man with so much reverence and fidelity, with such power and vision of conception, by the hand of undoubted genius. The man who won it out this picture will one day stand in the foremost rank of England's great landscape painters.'

When Ben Leyland read these words, he stood, and he had not stood since he was a boy at his mother's knee. From that day, fame and fortune were at his feet. Mr. commissioners poured in upon him that he could scarcely, for he was a slow, puny-looking, almost bloodless worker, and would not be hurried by any man. Although his pictures now commanded more pounds than they had been deemed worth shillings a half time previously, this change in his circumstances in no way altered Leyland's mode of life. He was a bachelor, and he still went on living in the same rooms in which he had now lived for so many years that they had come to be the only home he knew. He still frequented the same pleasure club, he was still as indifferent to the manifestations of his talent as of yore. Some of his old cronies asked each other why he did not retire to John's Wood, or to the still more fashionable art district of Kensington, as they would have done, had his good fortune been theirs, and there were even one or two who whispered that Leyland was growing miserably in his old age, and that he thought more of a shilling now than he used to do when he was not always where his wet day's dinner was to come from.

Many a struggling dumber, to whom a saving hand had been held out just as the waters of oblivion seemed about to sweep over his head, could have told a tale that would have confounded such croakers, although the chief reason which induced Ben Leyland to look so carefully after the 'house' was known to a few

only of his most intimate friends. His only sister had died, leaving behind her four orphan children to whom he was the nearest living relative. Those children had seen him as often to him as if they were his own, and it was for the sake of them and their future career in life that Leyland hoarded his money in a way that he would never have thought of doing for himself alone.

After Froisher had left him, Mr Ploworth wandered on, busy with his own thoughts, and of a very complex nature they were. Looking up at the point where two fortifications met each other, he saw coming towards him his daughter, Mrs Ploworth, Drummerel, and Captain Dyson. As soon as Clunie perceived her father, she hurried forward to meet him. Taking him by the arm, and keeping him well out of the line of the others, she said, 'I've a surprise in store for you, papa.'

'Youth, my dear, abundant with surprises, but at my time of life—'

'Now, don't be so to morrow, papa. Captain Dyson has proposed to me.'

'My darling Clunie, my sweet daughter! Come to my heart.'

'I shall.'

'This is an ideal marriage moment—a moment that compensates for—'

'Papa, you are getting old and tired me.'

'I, ha, my Clunie.'

'Indeed, Captain Dyson is a handsome fellow, but he will have a runaway marriage, without you in knowledge or sanction.'

'A runaway marriage! Hum. Why run away!'

'Oh, some silly notion he has got into his head about its being so serious, and all that. And then he is afraid, or perhaps is to be afraid, that you will not give your consent.'

Mr Ploworth laughed softly, and patted the hand that rested on his arm. 'I think perhaps the dilemma may be in Clunie. The marriage might be his to win you, the father the other he will set upon you afterwards.'

'We must give him no time to change his mind!'

'Not a day—not a hour. Let the matter be a runaway match, by all means. He wants his little summer, let him have it—and pry for it.'

'I would much rather have his half a dozen business, and have been married by a Dun.'

'But, but! Don't be foolish. Who can have all they wish for in this world? In any case, you may depend upon my secrecy in the matter. You will leave a little note for me on my departure—very slightly incognito note—praying for my forgiveness, or at least I shall be thunder-struck, grieved, indignant—a devoted father, in fact. I shall tear my hair—metaphorically—and call Captain Dyson the destroyer of my child. But by the time the honeymoon is over, I shall be prepared to forgive you both and to receive you with open arms.'

'Yes, papa.'

'Before you go, you may as well look up for me that passage in *Katy Lear* about an ungrateful daughter and a serpent's tooth. The quotation

will sound effective in the first strong burst of my grief and indignation.'

'Yes, papa. But will it be safe to marry without witnesses?'

'Let each of you heed that! After that, my Clunie, it will be very strange if you and I cannot contrive a simpleton like Captain Dyson in a way that will be eminently convenient to both of us. Only, put a curb on your temper for a little while. You must on no account allow him to think you anything lower than a sultry angel till all pecuniary matters are satisfactorily arranged. Honour him every whim, allow him still to belittle himself the most fascinating of ways, and keep on listening to his stories with the same thick-skinned interest that you listen to them now.'

'O papa, to what a fate you are dooming me! The whole of it, how I hate them!'

'After a time, you can have your revenge. Try to forget it, but in no time as long as you live you will take him back with you, of course. But in the first place, and will look after your comfort.'

'Yes, papa.'

'Have no more to do with the money, go to the police, or to the law, or to the court, or to the doctor, or to the minister, or to the magistrate.'

'Yes, papa.'

'We like my will go with you, Clunie. It is and it is a comfort to a parent's heart to see the children happy, but so carefully in the days of youth—the mind must be so carefully in the hands of the father, and the father must be so carefully in the hands of the mother. Would that all parents were as fully blest!'

'Of course all the arrangements have still to be made, but I shall be in a position to tell you more to-morrow.'

## MR STUBBINS IN SIBERIA

EVER within the last few years, the immense territory between the Russian Empire and the coast of the Great Mountains, and known as Siberia, and of which we give some account last year in this Journal (No. 93), has been for the quarter put unexplored, and a source of considerable speculation among geographers. Various travels during the last three centuries have partially penetrated the country, but those journeys in more recent years have been singularly barren of results. The work now before us (*Siberia in Two Volumes*, John Murray), the author, Mr. Stubbins, after giving a brief description of the all the expedition into Siberia made by Sir Hugh Wilson, who travelled there in 1871, and during the reign of the Tsar, and also touching upon the recent discoveries and efforts of Professor Dr. Nordenskiöld to establish a trade with Siberia and the Kara Sea, explains how, after meeting Captain Wiggins of Sandikland, who had previously had much experience in arctic travelling, he resolved to make a scientific expedition to the north of Siberia on his own account. It may be well here to state that the author had previously, in 1875, visited the delta of the Petchora, in north-east

Russ, accompanied by Mr Hurry Brown, the results of which expedition were afterwards published in an interesting companion volume to the present, entitled *Siberia in Europe*.

Mr Seibohm left London on the 1st of March 1877, and passing through St Petersburg, reached Nishni Novgorod on the 10th inst. Here, after lying in stores, the travellers commenced the long stage journey that was to convey them more than half way to their ultimate destination. Having visited various large Siberian towns on the route, they reached Yrenensk, on the Yenisei, on the 5th of April, at which place Mr Seibohm engaged a servant for the purpose of skimming, and preserving his ornithological collections, and also purchased a skinner, which he intended should follow him up the river. Travelling north through the valley of the Yenisei, and visiting the decayed town of Tura, which, the author and his companions reached the Koorayak, an offshoot of the Lena river, and the winter quarters of Captain Wiggins at midnight the 23rd of April, delighted again to hear English voices, and having eluded three thousand two hundred and forty English miles from Nishni Novgorod.

While waiting for the breaking up of the ice and the approach of summer, Mr Seibohm took the opportunity of studying the natives of these little known regions. The principal tribe he found to be the Ostiaks of the Yenisei, who are evidently very poor. They appear to have migrated northwards into the present region, and now often then living on the banks of the mighty river, fishing in summer and hunting in winter. The author considers them to be a race of cannibals, but found it difficult to obtain accurate information, as the various tribes inhabiting the Yenisei district are now mixed with the Russians. The Ostiaks consist of a short jacket of animal skin, long deerskin boots coming up to the thighs, and a 'core' shaped head-dress, tied under the chin, and edged with foxes tails, one 'point' over the face and the other round the neck.

On the first of June, the ice on the Yenisei began to break up, and in a fortnight had entirely disappeared. The author describes the sudden change from midwinter to midsummer as 'a revelation of nature, on a scale so imposing, that the mere prospect of observation was without it without feeling its sublimity. The improvement in the weather enabled Mr Seibohm to prosecute to a much greater extent his favourite ornithological researches, which had hitherto been without any important results. A general series of migratory birds set in, including many species well known in this country and throughout Europe. The first great rush of migration seems to take place as soon as the ice and snow melt. Indeed, many birds are in too great a hurry to reach their breeding grounds, overshoot the mark, and finding no food, are obliged to turn back. Among the specimens procured at this time were two rare species of thrush, namely, the Dusky Owl (*Merula fusca*) and the Dark Owl (*Merula obscura*), both of which breed in Siberia, but whose eggs have hitherto been unknown, also

the Ruby-throated Warbler (*Sylvia collinsii*), which likewise breeds in the far north, and the song of which is described as little inferior to that of the nightingale.

Shortly after the break in the weather, the schooner previously purchased at Yrenensk arrived, and Captain Wiggins' vessel taking her in tow, the whole party proceeded down the river. By a most unfortunate accident, however, the steamer ran hopelessly aground, and the remainder of the voyage had to be made in the smaller vessel. This accident completely frustrated Captain Wiggins' plans, and prevented Mr Seibohm reaching the Tundra in time for what he hoped would be the best part of his work. And thus duty to also no doubt the reason of his not discovering the eggs of such birds as the emerald vireo, lark, and smouldering, the nesting haunts of which birds are as yet unknown to naturalists.

On the 9th of July, having abandoned the ill-fated steamer, Captain Wiggins, with his own crew and the author on board, sailed north in the steamer, and after passing several native villages, arrived at Yenisei on the 11th. From this point, we are told, commenced 'the true Siberian Tundra, bathed with flowers, swarming with musquitos, and full of larks. In sheltered places, dwarf willows and weeping birch were grown, and were only some fifty or sixty feet from the first line, and there a few stunted larches. Winding the north the Tundra is the track of what had once been the bed of a river, nothing now but a small deep valley forming a chain of islands like an open field. In this region Mr Seibohm added to his collection many species of birds which hitherto have been but little known to naturalists, and having thoroughly exhausted the ornithology of the district, he sailed north for Gikhlova, which is situated on an island, and from which point he again visited the Tundra.

'The history of animal and vegetable life on the Tundra,' says our author, 'is a very curious one. For eight months out of the twelve, every trace of vegetable life is completely hidden under a blanket of six feet thick of snow, which effectually covers every plant and bush—trees there are none to hide. During six months of this time at least, animal life is only traceable by the footprints of a reindeer or a fox on the snow, or by the occasional appearance of a reindeer or musk-ox, wading along the banks of some river, where it has retired for the winter. For two months in midwinter the sun never rises above the horizon, and the white snow reflects only the stifflight of the moon, the stars, or the aurora borealis. Early in February the sun just peeps upon the scene for a few minutes at noon, and then retreats. Day by day he peeps up his white nose and more, until February, March, April, and May have passed, and continuous night has become continuous day. Early in June, the sun only just touches the horizon at midnight, but does not set any more for some time. At midday the sun's rays are light enough to blind the skin, but they glaze remarkably from the snow, and for a few days you have the anomaly of unbroken day in midwinter.

'Then comes the south wind, and often rain, and the great event of the year takes place—the ice on the great rivers breaks up, and the blanket of snow melts away. The black earth about the

the heat of the never-setting sun, quietly but swiftly, vegetable life awakes from its long sleep, and for three months a hot summer produces a brilliant Alpine flora, like an English flower garden run wild, and a profusion of Alpine fruit, diversified only by storms from the north, which sometimes for a day or two brings a fall and rain down from the arctic ice.

But wonderful as is the transition in the aspect of the vegetable world in these regions, the change in animal life is far more sudden and more striking. The breaking up of the ice on the great rivers, of course, is the seasonal event of the season. It is probably the grandest exhibition of stupendous power to be seen in the world. Streams of ice and hummocks of land are piled enough in their way, but the power displayed seems to be an empty power, which has to be shifted into a power to display its greatness. The silent upheaval of a gigantic river four miles wide, and the swift up of the ice fast thick as upon it at the rate of twenty square miles an hour, is to my mind a more genuine display of power, but for all that, the arrival of migratory birds, so suddenly and in such countless numbers, appears more forcibly to the imagination, perhaps because it is more mysterious.

Shortly after his arrival at Godebreen, Mr Seeborn found it necessary to abandon his previous intention of crossing the Kara Sea, and engaged a passage on board a steamer that was about to sail down the river as far as Yenisek, intending to finish the journey home on land. After remaining for twenty-two days down the river, Yenisek was reached on the 14th of August, where the author shortly afterwards procured a Kiwanoyak, and thence to Tomsk. Finding a steamer at Tomsk about to have for Yennisey, he arrived at the latter town after a more direct voyage, and then striking his previous route, in 1891, visiting Moscow and St. Petersburg, he arrived in London on the 30th of October, having covered altogether a distance of fifteen thousand one hundred and fifty-four miles. His chief regret was his inability to visit Siberia, which, although situated in the heart of Siberia, is considered to be the most European town of all the Russian, and where is found the highest and higher civilization generally than in any other portion of that vast country.

The reader obtains a very clear idea of the dishonest practices by certain Russian merchants who have obtained a monopoly of almost the entire trade in Siberia. Such a thing as commerce and integrity seems quite unknown on the Yenisey and other outlying districts, and interference with the Russians is rapidly reducing the people to the lowest stages of poverty and degradation. The corruption existing among officials is also described as being past belief.

Although Mr Seeborn did not succeed in one of the principal objects of his expedition, namely, the discovery of the breeding haunts of the curlew sandpiper, knot, and other birds, he was nevertheless enabled to study the nesting habits, and also found the eggs of many other little-known species. Among these may be mentioned the black-bellied, Asiatic golden plover, and dusky snipe, the eggs of all of which had previously been unknown to naturalists. The author also solved a hitherto uncertain question, namely, that the curlew and

hooded crows interbred freely, and also that the hybrids are fertile. He collected a large number of specimens in all stages of plumage, showing the relationship in different proportions to both parents.

The general results of this journey may be considered highly satisfactory, and Mr Seeborn is to be congratulated on having given his readers such an entertaining account of his experiences in a comparatively unknown country.

## WHIMSICAL NOTICES AND INSCRIPTIONS

THAT one has heard the story of the Parsley thread-spinner who, having received a scratch up in his nose, made use of one of his liberal habits in lieu of skin plaster, and went about his business quite unconscious of the fact that he was claiming the possession of a much longer proboscis than ever Jumbo can hope to own. The improbable character of the startling announcement—'Warranted three hundred yards. Although this tale may be a fiction, genuine public notices of a like humorous or ridiculous nature are by no means rare. Alvin Clark relates that he was exhibited outside an inn in Sweden thus forthrightly notice the weary traveller 'You will find excellent bread, meat, and wine within, provided you leave them your self'.

Turning over a file of the *Calderman Wireway* for 1789, we come upon the following curious inscription, which it was stated was to be seen over a cobbler's stall at Burnot. 'John Nunn, Operator in Ordinary and Extraordinary, Vendor of Soles, Uniter of the Drumstick, Restorer of Union and Humour, though of over so long and with a reputation. H—Gives advice gratis in the most desperate cases, and never pockets his fee till he has performed a cure.' This figurative cobbler was perhaps elucidated at the Yorkshire village school which in 1774 exhibited on a sign the following specimen of the learning to be had within. 'Wash, then and Rubben and Trew Spillu and also Muchraffa Achoun with double Lintery. Powd Skript Larle and Bouys Boured and good Yeitch for Children. If the 'Forth' the children received at this Dutchboy's Hall was on a level with the spelling, we pity them.

Dean Alford relates that the following periphrastic notice to engine drivers was exhibited—for a short time only, let us hope—at one of our railway stations. 'Hereafter, when trains moving in an opposite direction are approaching each other on separate lines, conductors and engine-men will be required to bring their respective trains to a dead halt before the point of meeting, and be very careful not to proceed till each train has passed the other.' Equally lucid was the placard announcing a pleasure trip to Warkworth one day during the summer of 1881, in which was the following paragraph, which implies that the crew adopted the light and airy costume of our painter's assistants. 'The *Gleaner* is one of the finest and fastest boats on the Tyne, her accommodation is in every respect good and comfortable,

her crew skilful, steady, and obliging, being mostly *peruted and decorated for private duty.*

We can easily imagine that a notice like the next one we give was quite as likely to have the effect desired, as one couched in the usual stern tone, and concluding with the meritable threat of prosecution. It is said to have been posted up at North Shields: "Whereas several black and disorderly persons have lately made a practice of riding on the sea-bathing machine, the head of the happy state, as we, but any accident should happen, he takes this method of informing the public that he has determined to shoot the said sea-bathing machine any person that may be riding on it at the same time to take care of him well, lest by some misadventure he should shoot the wrong one."

Every one knows how quickly a "not to be thought of" notice becomes disregarded by mistake. Rather a good attempt to put a stop to the objectionable practice was made by the late Mr. Skelton, an well known as the Chairman of the North British Railway Company. His garden, extending from Dalmeida to Lough of Alton, were open to the public on several days of the week, and on some of the most pleasant for the benefit of the public that was intended to be a recreation place with this local theatre. And cut a friend. Could any one do by such a touching appeal—it was a pity and an experiment?

Writing notices on window panes is still more objectionable, but we do so here to give the writer when he scribbles such lines as the following, which on a certain Sunday morning, were written on the window of the shop of an Alton Jew.

Whence comes it that in clean face  
Thy lip only has a place?  
Is it because the absent one  
Has gone to adorn his bed in London?

Of the various forms of scribbling notes which attack the building and sometimes also the full-blown poet, resulting in the capriciousness of words and glass we have referred to, perhaps the most curious type of the disease is developed when the poet writes the back of a bank note with verse. Wordsworth, Swift, Burns, and many others, have scribbled lines on stones, window panes, and other odd places, but the last mentioned poet is, we believe, the only one of the three who ever indulged in the luxury of writing forth a poem on the back of a bank note. But the following effusion, we fear, was not the work of any poet known to fame. The lines appeared, if we remember right, on the back of a Union Bank of Scotland note, which passed through our hands many years ago, and note and poem have no doubt long since been included in the banker's Index Lapidary, and committed to the flames. The lines were entitled "Ode on an Owd Note," and were as follows:

I marked the "oldest" biller on the land,  
A note he scribbled in his hand—  
A note whose rare effluence shed  
A halo round about his head.  
He threw 't—I caught it in my hand,  
And was the happiest mortal on the land.  
But now, alas! 't is almost as of yore,  
As I throughout the world seek roam  
Without my long loved On Fossil Notes  
A tailor claimant has my aid,  
With face unshaven and beard unpared,

Who says: "First note must pay your coat!"  
With in my sight, with many a tear,  
It goes now to the man of the street  
"I sit well, farewell, thou gem of notes!"  
Gives pleasure to the man of the street  
And may he learn to love too his "mend,"  
"The quality of money is not its end,"  
But I shake him like the roaring gale.  
As "Shakespeare" says: "I now conclude  
To all, my peace good will and regards,  
And to all notes I say, 'All hail!'"

From the many quaint rhymes that have been written beneath parts of us, we select one which was to be seen under that of an old house at the *low end* of St. John's Street, Clitham, a hundred and fifty years ago.

This is the honest hostler of the 17th c.  
Who never robbed a man-him of a penny  
'Tis hard to see, they'd say, I should have known  
But now, they say, it's John Knight's by now.

Thomas Hood, Charles Dickens, and others have exercised their wit in flinging humorous titles for sale or dummy book backs, but placed as to hide a dose of blank space in a library. As the reader will remember was the character of the "Acrophony," in sixteen volumes, which excited the curiosity of the "Familiar Man," whose misadventures at a friend's house Henry Melville has so graphically described. Laying his hand on the first volume, and pulling it loosely, under the "Familiar Man," he was surprised to find that instead of books, "a board which by further enquiring had been made to look like a volume," came tumbling down, and upon his pitch up as a "Walden" underneath on the table under it. He certainly did not make the customary less tedious when he attempted to stop the current of ink that trickled to the floor by means of his rumpled handkerchief.

Hood's list of dummy to be included the following: On the Anatomy of the Death Watch and the Sheep Tick, Melville's Attack of Infidelity, John Knox on Death's Door, Debit on Chum Pien, Cursey Remedy on Swimming, Hoyle on the Game Law, and Percy Vail, in forty volumes.

Among others, Dickens had the following dummy books in his study at Tavistock House: London Account of the Whale, The Gunpowder Magazine (four volumes), On the Use of Mercury by the Ancient Poets, The Books of Moses and David (two volumes), Bait (of Birmingham), on the Sublime and Beautiful, and Early Lessons on the Horse.

A public library is not the place where one would expect to meet with sham book titles; but a book met the gaze of the late Professor de Morgan at Cambridge, on his first visit to the reading room of the Museum, which might have been mistaken for a "dummy." He began his inspection, he says, at the ladies' end, where the Bibles and theological works are placed, and the very first book he looked at the back of had in flaring gold letters the startling and prime title, "Blast The Antinomians." Thus did the reader apostrophize the poet whose history had been written by Dr. Blast, by omitting the separating line between the first two words.

We are assured of the genuineness of the following curious notice, addressed, quite recently, to the members of a Friendly Society, which need

not fix a 'run' upon it, if the procedure therein described be rigidly adhered to. In the event of your death, you are requested to bring your book policy and certificate at once to the agent, Mr. —, when your claims will have immediate attention.

Those who write public notices, however, sometimes have the tables turned upon them by some wiggish ruler, who appends on delicate ink words or letters, which has the effect of making the intimation set forth a distinct warning from the one intended by the original notiser. We will conclude with two such anecdotes, and in the first will be seen that the letter was hit. Recently, a clerk of Stourbridge had his feelings outraged by an addition made by a passing merchant to a notice he had affixed to his shop door. The aggrieved man thus told his neighbors to take to the editor of the *Stour Valley News* 'I had attended the Rochford last Thursday as provost in a Fifth of November row, therefore I was to give my shop door "Closed for a few hours," in which I return it, I found some one had written "Thank in God, can't get up." As this was injurious to my business, I beg to state that I am not here in an absolute way more than two years.'

A few days previous to the beginning of a session, this brief and somewhat looking notice was affixed to the notice board at the entrance of one of the classrooms of Loughborough University. 'Professor — will in it his class on the 4th inst.' On the evening of the 4th, a student, who had probably attended the class during the previous session, and had imbibed some of the well known humor of his witty preceptor, copied the letter of the word 'class'. A group of youths gathered in the vicinity of the notice to observe how the Professor would receive the intimation, which now set forth that he would 'meet his class on the 4th inst.' As the Professor approached, he observed the change that had been made, and quietly taking out his pencil, made some further modifications and passed on, a quiet smile over his face, his features. The notice now finally read: 'Professor — will meet his class on the 4th inst.'

## THE MONGOOSE

Extirpation not only is not limited to the canine race, and every animal has its day. The mongoose accorded to the Colorado beetle was eclipsed by the clamor of Junco, who in his turn gave way to the ants, bees, and wasps, as introduced to public notice by Sir John Lubbock. Now the mongoose, or mungoose, as it is sometimes spelled, by no means an obscure representative of existence previously, as well to the eye, and has become the theme of burning controversy in connection with its recent extermination in Jamaica, and proposed establishment as an addition to the fauna of Australia and New Zealand.

When one speaks of the mongoose, the common Indian species may usually be understood as indicated by the title. People who visit zoological gardens and collections are often surprised to find no mongoose there, the fact being that it

is better known to naturalists as the *Ichneumon*—an animal of the weasel tribe—and is usually so labelled in menageries and museums. There are no less than twenty-one different species besides the mongoose (*Herpestes erinaceus*), or gray ichneumon, which it was the object of the discussion going on at the present time, and several of these are found in India.

No widespread as the reputation which the mongoose has acquired as a destroyer of serpents, that the mere mention of it invariably presents it to the imagination in that character, and deters, in telling one to a hesitating and one who is seeking a new pet, in all in which 'How shall I get on? to feed it on?' The inevitable mystery which seems inseparable from a reptile seems to infect everything with which it is brought into contact, and the little ichneumon is enveloped in a cloud of fables relative to its 'antipathy' to serpents, the purely disinterested motives which had led to its introduction, and its immunity from the effects of the venom, when bitten by poisonous kinds, owing to its knowledge of an antidote in a certain herb, leaf, or root, which it uses and eats directly its victim is laid. Such the tale was disseminated long ago by scientists, though they still hold great influence in our estimation. The mongoose devouring snakes when it gets the chance, but it does so for the proper purpose of eating them, and not from any venereal antipathy. It would be hard to believe that it could cut its teeth into the hide of a cobra to get at its meat upon the earth for the express reason of its being vitally destroyed by any other, independently of any actual object. The mongoose devours serpents, as it devours birds, rats, cats, and many other things, and certainly betrays no preference for an opinion that when it has a chance it food when well fed, it will not kill them, but special means often lower the snakes in the estimation of their owners by allowing to exhibit their wanted propensity and skill in the capture, or extermination, or even anticipation of their customary prey of snakes.

Some years ago, when the ravages of the cane-rat became so serious in Jamaica as really to affect the prospects of the colony, the Great Lord (J. R. G. G.) a mongoose introduced into the island, and did much good by devouring the young rodents. It proved inefficient, however, to cope with the pest thoroughly, and the gray ichneumon has now been acclimated there, with such benefit to the plantation, that it is said that over a hundred thousand pounds a year are saved by it in the districts where it has multiplied.

Are we to infer from its success in Jamaica that it will prove an equal blessing to the mephitic, or permanently quarantined on the rabbit-ridden country, as a proposed? Obviously their cry for help is not without cause, when we hear of a quarter of a million acres being abandoned by one owner, after he had spent no less than three thousand pounds in fruitless efforts at extermination, of half a million rabbits being killed in a few months on the property of another, and of seven million skins being forthcoming in a single year, the heavy trophies representing

only a portion of the number of bonuss actually destroyed. In Australia, will the moon effect what the savage and rapacious dingoes seem powerless to accomplish, and end the country of her terrible death agony as well? And suppose it does effect such a clearance, what will be after considerations?

The acclimatization of an animal in any country, except in a domestic state, is always, to say the least of it, a perilous experiment. Nature has apportioned to every region its due share of animal and vegetable life, in the former best adapted to neutralize excess, and this balance has been disturbed in New Zealand by the introduction of the rabbit. We have seen what the rabbit can do in a quarter of a century; we have seen in many instances what small birds—hunted with sentimental delight by the off-circles of winged tokens of home, or imported, as in the States, to quell some insect plague—can bring down upon their patrons in foreign land; in short, it may be said that nearly every climatic creature has proved to be more or less a nuisance—a harsh and unkindly visit truth.

Let us look for a moment at the probabilities which the mongoose offers by its establishment in these colonies. Most likely the climate of New Zealand would not be favourable to its increase—the common rule is already suggested as a substitute for it there, but there is no doubt it would do well in Australia. The rabbit, once monoly prolific, and very considerably grater in bulk than a rat, would be much more slowly reduced in numbers than the latter animal, for, be it remembered, the mongoose kills for food, and not for killing sake, and a rat almost, if not quite equal in size to its own body would furnish its food for some time. Before the rabbits can be exterminated, therefore, or even appreciably diminished, the destroyer must have enormously multiplied, and when their legitimate prey is exhausted, what are the crops going to do? Starve, or eat each other? Certainly not, is long to poultry farms exist. Eggs constitute a favourite food of the mongoose at all times, whether snakes and rabbits are to be had or not. In short, it is as much to be dreaded as a fox in the heart of the heart. Furthermore, though gentle and tame enough when domesticated, in its wild state it is fierce and gluttonous, and would not hesitate to attack even sheep when rendered desperate by famine.

The ultimate result of the experiment in Jamaica remains to be seen, but there is less danger to be anticipated in a country which swarms with the smaller forms of animal life, in that island does. Horrified protestations were raised the other day when somebody named the jackal as a suitable antidote to the rabbits in Australia, nevertheless, it may be doubted whether such a creature, or some cat, like the puma or ocelot, would not prove a safer introduction in the end, doing greater execution by smaller numbers, and being more readily hunted off when no longer required.

Better to bear those ills we have—especially when we have incurred them by our own act and deed—than fly to others that we know not of, but as it is proverbially an ill wind that blows nobody good, and every cloud has a silver lining, so the rabbit affliction already presents a bright

side. Messrs. McCall and Sons, of Paysandu Otago, are setting up factories in various parts of Australia, New Zealand, and Tasmania, for the purpose of exporting cooked rabbits in tins, and if the addition of the baneful 'various' in this or any way can only be made a recognized industry and source of profit, the little moonstone may be left to do battle with cobras and other pests, undisturbed in his happy Indian hunting grounds.

#### ILLISLAND

THE year was in its prime for June  
We were sitting on the banks of May,  
The sun was climbing to high noon  
The breezes sent us sportive play,  
When by the winding Nith we staid;  
With gleams of feet, that we might stand,  
Where 'neath the humble roof we sat still,  
Oft sang the Bird of Illisland!

We saw the lark so larkiest nest  
The housewife's hand, the lark  
And how the sportive lark, and the  
Among the yellow lark, and the  
The ploughman whistling at the plough,  
He sang it clear, but we tony lark,  
Where the lark is along the house,  
The lark's house of Illisland!

We saw a lark, a lark, a lark,  
Across her glowing wood, and the lark  
And the lark, or again some strain  
The lark, which he chanted forth the lark  
We saw the lark, the lark, the lark,  
Where the lark is along the house,  
And the lark is along the house,  
And the lark is along the house,

We heard the lark, the lark, the lark,  
The lark, the lark, the lark, the lark,  
And from the sky their warbling fell  
The lark, the lark, the lark, the lark,  
And we heard the lark, the lark, the lark,  
We heard that some lark, the lark, the lark,  
Might yet be heard to sing again  
The lark, the lark, the lark, the lark,

We marked the lark, the lark, the lark,  
The lark, the lark, the lark, the lark,  
The lark, the lark, the lark, the lark,  
The lark, the lark, the lark, the lark,  
We marked them all with loving eye,  
Yet plucked them not with ruthless hand,  
But left them there, to bloom and die,  
Upon the lark, the lark, the lark,

While down the dale the lark shall go,  
Where the lark, the lark, the lark, the lark,  
While the lark, the lark, the lark, the lark,  
And the lark, the lark, the lark, the lark,  
While, like a guardian sentinel,  
High Christ still shall proudly stand;  
While love in loving hearts shall dwell,  
With them be loved, dear Illisland!

## CONVICT LABOUR AND HARBOURS OF REFUGE

THE distribution of convict labour in England, Scotland, and Ireland is just now attracting great attention. In October 1881, a Committee was appointed to consider this question, and they have lately completed and published their Report. The rapidly accumulating completion of some of those large public works on which convicts have for many years been employed, has excited a special consideration of the subject of their future employment. The Committee were chiefly concerned to examine into and decide between the merit of no fewer than six schemes, of which that of harbour construction was the one decided upon as the most important and the most preferable, and it only remained for them to consider what locality was the most suitable for the object in view.

The practice of employing convicts in executing large public works has long been regarded as a necessary element in our penal system, and Dover has been chosen as the first convict depot in consequence of the authorities having determined to construct a pier and breakwater, to form, with the existing Admiralty pier, a national harbour at that port. The abolition of transportation, which was at first a temporary expedient, but ultimately became permanent, first rendered it necessary to provide occupation for convicts at home, the immediate result of which was the establishment of Portland Prison in 1848, and, subsequently, the alteration of the old prison of war at Dartmoor in 1870, the opening of the prison at Portsmouth in 1868, and at Chatham in 1866. The experiment proved to be very successful. The construction of the magnificent breakwater and fortifications at Portland, now all but completed, is in itself a substantial proof of the utility of employing convicts in this way, and goes to show that it is quite possible to make them repay to the public a considerable proportion of the cost of their maintenance. Similarly, the dockyard catenans at Portsmouth and

Chatham, and the reconstruction and cultivation of waste upland at Dartmoor are satisfactory indications that the convict and the treadmill have been wisely placed in hand, and lead us to hope that 'bull labour' will no longer be merely an expensive and fruitless part of the punishment of prisoners.

The more the conditions for the satisfactory employment of convict labour are, that the works on which they are engaged should be capable of absorbing a capital to a large number of convicts simultaneously and for a considerable period. The expense and difficulty of finding suitable sites for piers, and of creating proper buildings, render it difficult to have small parties of convicts, as well as to have a large number of works upon which they were engaged were small, and such as could be completed in a short time. Thus, the erection of a pier along the coast of the Lee country in England, to keep out the sea, has often been suggested as a suitable occupation, but the difficulty, while the employment of prisoners in small scattered parties, the interruption and uncertainty which would be caused by the tides, and the prospective derelicting in connection with various considerations, are such that schemes of this kind have had to be finally neglected.

The formation of harbours is admittedly the most important of all suggested projects. Whether as harbours of refuge, or for commercial purposes, or for the purposes of national defence, from all parts of the coast of Great Britain a numerous appeal is increased accumulation. In connection with convict labour, however, the paramount consideration is the suitability of any proposed locality in situation and otherwise for such a purpose. It is only after this crucial question has been decided that it is necessary to consider whether refuge, commercial, or defensive purposes should have the preference. It comes from the action of the authorities in selecting Dover, that national defence should be our first care, for it is admitted that so far as refuge is concerned the proposed harbour at Dover is

of secondary importance. Fife, which was also suggested, is, on the other hand, one of the places where a harbour of refuge is greatly needed, and it is reasonably contended that its position with reference to the Dogger Bank would make such a harbour of the utmost importance to the North Sea fishing fleet. It is at the same time admitted that its suitability for the employment of convicts is even greater than that of Dover and that it is no less capable of becoming a most important harbour for national and strategic purposes. In view of the circumstances it is difficult to understand upon what considerations other than those that are purely defensive, Dover has been selected in preference to Fife.

It is easy to find in other localities where harbour works are not so immediately needed, although, of course, in any of these an all-round convict prison. Thus, at Poole, Port, a harbour is much wanted to shut out the heavy seas from Plymouth Sound and to render the anchorage more safe. Again, at Bournemouth Harbour, if only improved, it would be of the greatest use in heavy weather to ships trading up and down Channel. Alderney breakwater needs repairing and fortifying. Harbours of refuge are required at Poole, St Helens, Dundee, and at a great number of other places on the coast, for the protection, more especially of fishing vessels, vessels while, on the Scotch coast, Dunbar, Tynemouth, and Peterhead are named as requiring want of similar works.

The proposed harbour at Peterhead is especially important, both on account of the peculiarly urgent necessity for its construction, and because it is an eminently suitable locality for the employment of convict convicts. Under present arrangements, male convicts sentenced to Scotland are, as soon as possible thereafter, transferred under the Secretary of State's warrant to one of the English convict prisons, where they pass a punishment period of nine months. They are then divided into one of the public works prisons in England, where they pass the remainder of their sentence of penal servitude. It has long been repeatedly urged that convict convicts might be more advantageously employed on public works done for the benefit of Scotland. In May 1882—the latest date for which figures are available—there were in the different English convict prisons seven hundred and seventy-one male convicts who had been sentenced in Scotland, and, of these, five or six hundred could be fully employed at Peterhead. If the project is considered in the first place only so far as the employment of convicts is concerned, it should be noticed that in olden days, situated between the great north breakwater and the town, it would be capable of accommodating one hundred convicts, and in unroofed storehouses near the end of the north breakwater as capable of holding two hundred more. The facilities for isolating the prisoners from the neighbouring population, and hence from close to the works, with an abundant water supply, and in a healthy situation, are indeed so considerable, that the suitability of the locality for a Scotch convict prison is placed beyond a doubt, and could certainly not be surpassed.

It only remains to consider the urgency of the need for the contemplated harbour of

refuge—a question which can be conclusively answered. The north-east coast of Scotland is almost entirely bounded by rocky cliffs, and the sea is, especially where there are no piers, and there, under its peculiarly dangerous to shipping and especially to fishing boats. Although the importance of the Scottish fishery system is undoubted, it is not more so that there is not a single port along the whole coast, from the Linn of Loath to Charnock Linn, in which vessels and boats can run with safety during bad weather. Peterhead was recommended by a Royal Commission as long ago as 1859 as the most suitable bay on the east coast of Scotland for refuge purposes, but owing to the local authorities being unable to raise the necessary funds, nothing has yet been done to remedy this dangerous state of things. As an instance of the interests involved in this undertaking, we may state that the number of fishing boats on the coast from Newton on the north to Brough on the south, of which Peterhead is the centre, amounted in 1881 to two thousand eight hundred and ninety-four, manned by about eighteen thousand and eighty-seven men and boys. The value of this property was put at eight hundred and fifty thousand pounds, and no fewer than fifteen thousand persons were employed in the industry on the coast. It has also been admitted that the annual loss in the Scotch fishing trade in consequence of the want of adequate accommodation, such as it is, is put at eight at Peterhead amounts to upwards of six hundred thousand pounds. These figures are, of course, to indicate that, apart from humanitarian considerations, the commercial interests involved in this question are of some magnitude. It is certainly to be hoped that the authorities will feel the pressure of such facts as these. The evidence is indeed so overwhelming in favour of the practicability and desirability of the project, that it may be confidently hoped it will not be long before something is actually done. Now that it is so easy to revive the arrangements for the disposal of convicts, the opportunity of successfully meeting the claims of Peterhead is too good to be lost.

It has never been the policy of the British Government to erect the fishing industry from the public funds. It has been left to itself to provide harbours in exactly the same way as the commercial marines. But the case is not parallel to fishermen, who have been aptly described as 'the poorest farmers of the world,' or, of course, merely poor men. The fishing industry is not sufficiently large in any one locality to enable it to provide harbours constructed on any but a small scale, and one limited to local purposes only. It is hopeless to expect that the numerous crews interested in the fish trade will construct works of public utility and national importance, though facilities are offered for local authorities borrowing funds for such a purpose from the Government at low rates of interest. But few local authorities would be justified in borrowing money which it is exceedingly unlikely they would ever be able to pay back, and the interest of which could only be paid by charging heavy dues, which would go far to nullify the advantages offered by a harbour of refuge. In many localities,

indeed—and it would be difficult to find a better illustration of this than the Petrolol where there are practically no real funds at all for such a purpose, but only of any but the most meagre description must be constructed out of public funds, or not at all.

It will not perhaps be widely credited, but there is too much reason to believe that shipowners and persons having an interest in shipping are opposed to harbours of refuge. They are content to pay tolls for lighthouses, to use the facilities of light and courtesy for passage, but harbours of refuge, we regard as offering distinct inducements to captains to wait time according to John Cook, C.B., the colour examined before the Harbour of Refuge Commission in 1899 represented that the shipowners did not seem to mind whether the ship sank or not, and that all they appeared to care about was a quick passage. Doubtless there are many shipowners who are strongly interested in the preservation of life at sea, but it is justly to be feared that many others are more culpably selfish in their views concerning questions of this kind. It is, therefore, quite hopeless to expect that even if interfered in keeping their vessels at sea and fully insured, will contribute to any great extent towards the construction of ports better adapted for safety than for trade, and it seems obvious that the interests of humanity demand that the steps they upon this question should under some modification to meet the necessity of the time, not to protect the boats of the sea, who are in such matters wholly unable to protect themselves.

## ONE FALSE, BOTH FAIR.

OR, A HARD NOD.

VIII.—THE TALE OF THE WOMAN  
WILLIAM

'FAIR to catch, first to dust'—I have heard of this which has been said of millions of times on the brink of the grave for his day. But there is a difference in catch, and the value of dust varies. The dust of the late Marquis of Lonsdale was of the more precious variety—solid dust or diamond dust, so to speak, and it was to be laid to rest with Lonsdale, pomp and costly decorum. The youth with the remains of her late noble owner on board, had much an exceptionally good passage from Lonsdale to Cardiff, thanks to propitious breezes and the vigorous aid of a relay of useful, well-served, steam tugs, and a great London firm of fishmongers undertakes to show the rest of the world of love with them, to whom such tidings that was an excellent advertisement. Very elaborate, and it need not be said very expensive were the preparations for the interment. Harbours of Refuge had the official College had not declined to earn exorbitant fees by giving their best attention to the nice adjustment of the numerous quarterings in the gorgeous hallment. Alas! from the hour when electricity had flashed the news of the late Lord's death on distant Niles, the dismal purveyors for the last and luxury that surrounds the rich, had set their numbing spritzes to work, and with very good and suffi-

cient results, remote a Celtic Year in from London.

They gave the late Marquis of Lonsdale a very fine funeral. Wales is a country where gravity, and resistant, and a country where overpopulation in many cases causes the humblest neighbours, whose pack it is to be, and their quarrels as there, and to use the Welsh speech wherever considerations of money make it not interfere with Cyman's sentiment. But even from the stony rocks of Wales came many a message to comfort the master, thence received from the Irish English border since. There were ladies, ladies in numbers, who desired to pay a tribute of respect to the deceased chief of a great House with a word of condolence. Lonsdale. There were tenants, too, and tenants, and field hands, who were moved by some touch of feeling, or instinct of sympathy, or consideration of expense, to be there, and then there were inquisitive people who went to see the show as they would have gone to see any show, so that whether the procession was in numbers or in the least, only of a human and pitiful kind. But all were black, or that put it, of mourning which with the early reports of the funeral suits of one's own living in this, and all perceived a serious living, such a due courtesy demanded.

As to Lonsdale and for the day he, there could be little of that expected form in his young widow. The late Marquis had not seemed long enough to have his much too good or ill in the last land property that he had inherited, and his estate had but a vague recollection of him as a child, pulled by a white, and a few years ago, and a child with good intentions and a kind heart—credited also with being careful and economical. He was known to have the most perfect projects that he never had had the time to do, much less to carry out, the death of the inevitable opprobrium that was his out project, and all in the same. Perhaps the late Marquis was not rich enough to have carried out his schemes for the public welfare, and then they would have been, but they may have been. It was a good deal of words here, of dignified parliament, to let me anything, even an estate in a village, or a turnpike trust or a Band of Friends. But such was the people around the late Marquis had in his last days, and the young lady who had had a little improvement of the splendid prize he had done in the letters of birth, and was willing to do honour to him, as well as to the majority race from which he sprang.

Yes, it was a fine funeral. Newer Toll and Woff, the fashionable undertakers above mentioned had put the late Marquis in the most magnificent of lifting the exceptional payment, like a sunburst, perfectly conducted. The late Marquis himself, the real head of the firm, was present, and under and paid for the and a solemn, the whole black array of work, felt as it were, then, and the eye upon them, and sniped them when in some discipline and minute attention to detail. The noble black horses had never looked shicker or ponderous, with their glossy necks well arched, and their heavy silken manes as carefully adjusted as the hair of a court

beauty. The new English planter, in their silver gilt stands, modelled in harmony with the flippant velvet of the embroidered caparison. There were the gilded shields on the head and on the coffin—or cushion, as the Americans are pleased to call it—with its costly materials and daint workmanship. The flag, as the topmost turret of Castel Viver dotted half-way high in the Welsh mountain haze. It was a long line of carriages, followed by a long line of infantry and foot people, that wound along the upland road through the park to that remote spot where stood the manor-house, hued by the sun of an autumnal day, neglected since the Revolution, where so many Montgomeries slept beneath massive stonework and beamed ceilings of painted plume. The weather was perfect, without so much as a shower to smother the brilliancy of the sky. And London newspapers gave a full hill-climbing, and country journals a liberal portion of their space, to the chronicle of the event, much to the future benefit in a business sense, of Misses Toll and Whiffle, of Hillier Street, S.W.

The wildest mourners are not those who take rank in the procession that follows the body to the grave. They are the women who sit at home with aching hearts, and eyes that are blinded and dimmed by tears, thinking over and over of the loss, and believing—as women do in the simplest hearted unworldly person of the time—that growing grief and aching eyes will vanquish must be the result of his bereavement that the world will never be so pleasant to him never shine so brightly again, now that that one is gone and the loved voice hush in their ears. Surely it must have been hard to bear, that trying morning, for the fair mourner as she sat in her chambered room, listening to the deep notes of the bell tolling in the valley below, and the million roar of the cannon as the minute guns were fired during the march from the castle to the main drum for the command undertakers had neglected a thing that could enhance the impressiveness of the occasion. The young Lady Parnment of the place had no kindred of her own, no old friend to bear her company, only, for consolation, the brief visits of Lady Barbara, whose nature was not over sympathetic, and whose mind was engrossed by the economical reform, and the evidence which it afforded that the House of Montgomerie was yet a power in the land.

There were old friends of the family whom it behoved Lady Barbara to see in the gathering broke up. And then she had to speak a civil word or two to the new Marquis of Loomington, who had been so long known, and perhaps long known, in Pall Mall regions as Adolphus in 'Dolly' Montgomery, and who had come down out of pure politeness, and because the aristocracy seemed to expect it, and the lawyers hinted that it was not fit to be chief mourner at the obsequies of his cousin—his cousin, who was such an acquaintance.

But I hardly knew him to speak to, this new peer had said deprecatingly to his own impetuous solicitor, Mr Tape (Tape and Jarret, Lincoln's Inn).

There are duties, I must point out, incumbent on your new position, my lord,' rejoined mean-

able Mr Tape, 'and I can assure you, Pounce and Pontifex, who seek for the late Marquis, take it as a matter of course that you should attend.'

So, in a shy, almost apologetic manner the present peer did attend, and allowed himself to be shuffled by the managers, so to speak, of the funeral enticement into the post of honour, and then confronted the oriel, from which he flinched, of a short conversation with Lady Barbara, who stiffly thanked him for coming there, but let him see pretty plainly that she resented his promotion, lived as it was on the extinction of her own branch of the family. And the new Marquis, as he was speeding back by rail to London, felt himself a little injured, and but held a kind of Loomington, since he had soon taken a cold Vaux, that was left for life to a man out of a girl, and would probably never prove under the misanthropy of that matron bachelier whom his friends knew as 'Dolly.'

There was a good deal of stately evening and drinking at the castle, of course, in that hospitable district, with luncheon for all, wine for the chief guests, and for the men and the women, and then the crowd dispersed as silently as a thing which, and beating horse-hoofs would permit, and the sad day's length came to a close. On the next, the flag that had flout it held high on the lofty flag, but of the old castle stronghold was to be hauled down all at once, for that young mistress and Lady Barbara were bound for London. They had written, as usual, to their previously expressed intentions to see Parnment, and to that sister of his who had found shelter in the home of lonely and distant, beneath her roof in Prater Street. And the young lady in her widow's weeds almost would Lady Barbara by the frequency of her allusions to this change of silence, as involving a part of the mourning the funeral.

'I shall win her back to me.' 'Do you not know, Lady Barbara, that she will come back?' 'In a millenium,' and the haughty challenge of a cold Vaux, looking as unbendingly severe as that Queen Elizabeth to whom she was thought to bear some resemblance, daily said that she 'hoped Miss Carew would awake to a sense of duty.'

Next day, both ladies, with servants, baggage, and carriages, all the impediments to say in words in that ancient the great, left Castel Vaux for Lancaster House, London, W.

(To be continued)

## LADY'S SHARE OF POETRY

'What! the poetic aspect of the lady—poetry among the rears of the nursery!' exclaims the young peer, jumping to his own conclusions. 'Alas!' There is nothing of the sort in real life. Bother and tattle, act meuth and lald hild, tattering and tumbling, squalls and squalls—that's just poetic baby for you, when you are it now enough—and hear it!' And so it may be. But would you poetry be left in the world if we watched only the meagre details of life, and narrowly scanned poor humanity? Even the heart sung by ten thousand poets, would be called by your keen watcher only a natural pump

for supplying the system with blood, while the poet calls it the centre of the power of loving, that most divine of all human powers, with whose pulse the affection the outer world keeps in unison, transformed in a glorious vision, so, through him, in that song, as uttered by him, follow, sang to the 'little youthful maiden, that the heart has its love, as the sea has its pearls and the heaven its stars, and that she has it as greater than sea or heaven.

For all that, the heart is a blood pump, and a man's marriage prospects do not affect the atmosphere of the love of motherhood. It looks beyond—beyond the mortal walls of flesh, and into the souls passing imperceptibly of this world that joy can light up, or just darken like a winter's blight, and lo! the poets we might only they see all things with a noble vision of their worth, and is that my poetry like what is wrapped in humility still, shining and sparkling, through the thin poor wool of common daily life. So just as there are poems that tell us about the heart or anything else under the sun, there are poems that tell us about the baby. Let us claim the poetry of babyhood as one of the gems that sparkle through the web and work of ordinary life.

Many poets have written verses to the welcome little stranger. They have even addressed the small thing itself, with a warm heart, and accomplished it with a genuine sense of its future rank and status. They have by a stroke of imagination hung over the cradle, with its perfume of chamber and nursery, not made it a shrine to classical lore and names that fit not a newborn, but would be long enough to choke the child. 'To a sleeping Infant' and 'Lullaby to an Infant' are often dull readings, though the author's name may have been great in its day. The very title hints the inapplicability of such. Among the poems of George Meredith there is a few lines that simply *The Baby*. They are short enough to quote, and are in the following lines:

What did you come from I say dear?  
Out of the everywhere into here?  
Where did you get your eyes so blue?  
Out of the sky as I came through  
What is that you sit so broad and sure and high?  
As it bairn to bid it so I went by  
What is that your cheek like a warm white rose?  
I saw something better than any one in us  
Whereas that this cornered smile of mine?  
There are things here as it comes alive  
What did you get that crest of a  
Go I say, and it came out to be  
What did you get those arms and hands?  
I saw made right with mine and I can't  
Where came you feet so a little thing?  
From the same I as the other two things  
How did they all go to come to be you?  
Go I thought, but at last as I saw I get  
But how did you come to be, you dear?  
God thought about you, and so I am here

In 1890, when the Posthumous published a new volume of *Ballads and Poems*, it was dedicated to his baby grandson—golden-haired Ally, away with laughter and bubble.

Now that the flower of a year and a half is there,  
O little blossom O mine and name of mine,  
Glorious poet who never last within a look,  
I laugh, for the name of the best of my verse is there,  
Mayst thou never be wounded by the name that is mine

The words about the unknown poet who never has written a line, reminds us that this is a frequent allusion when child living poets speak of the little ones. Merely rightly observed—while noting that singular power in children by which, in their play, for instance, they can imagine themselves kings or queens, angels or fauns, giants or pixies, and act as if they really were so—that 'children are your only poets' Longfellow has said of other children that they are better than all ballads ever and we sang, for they 'are living poems—and all the rest are dead.' And of a very little child—whose rustic and little had suggested the romance of the romance of a child and a girl—in exclaiming:

What I have already, with those suppliant looks,  
And voice more beautiful than a poet's book,  
Or unnumbered sound of water as it flows

In the same poem there are some exquisite interpretations of baby manners and conduct. Let us mention, that even in which we should rather call the innocent dumbness of infancy, the calm, serene, untroubled state of the little stranger in our world.

Like one who in a foreign land  
Abides on every hand  
Some corner of wonder and surprise

While he takes not thus of the quick and questioning eyes he gives to the hand a more significant motion, when the meaning of the time to come, he loses sight of physical realism in seeing the no less of it, as a dream, of life.

Here at the poet's desk stand,  
And with this little hand  
I have opened the mystery of life  
Into the future's undimmed land  
I see the future every day  
As at the touch of life

In all we have quoted we should do better, if it were not clearly be at work. There is no poetry unless the heart speaks. Many have been the verses to infants—and to anything and any one else—in which there is not an atom of poetry, because there is no truth of feeling. If poetry is the outpouring of the most beautiful of human thoughts, doubtless there is more of it in the loving heart of a mother than in half the volume of stereotyped verse ever written. More than that—at the present poets are only those who have written with most sympathetic description of the highest and purest of human feelings, is not there something better than all the volumes of written poetry, in the hearts of the who see the beautiful side of human love, and who at sight of common things can feel that their meanings, and dream kindly dreams over their true world? All mothers have this power in their hearts, it is part of the love and admiration that helps children, when we set the soft young have but the instinct of affection, and we help, speechless, uncomplaining, blankly understanding, except to loving eyes. There are infinite possibilities in the future of the most commonplace baby, who dreams are dreamed over the softly shut eyes—what visions of the preciousness of its love and its life! The dreamer of these dreams is unconsciously revealing in most delicious poetry, in half-chimed fancies, and in purest affection, that each all firm in the trenches to words, just as our deepest feelings are

always untranslatable into the same language of the lips. Let the happy mouth round whose thoughts circle this tale of poetry, say in a poor woman in a cotton gown, whose roughened hands are pained to turn the little socks—socks picture-had in age consigned with the sleeping baby that owns them. To the lowliest lot that child hood touches, there is a bright mile of warm feeling and happy thought, if it could but be realised, that bright mile in its thousand forms, is the poetry of common life.

In the little hands and feet alone, there we hunt for a world of wonderment. What weary journeys have those little feet to go to over the wide wide world perhaps—those great quiet little feet that curl their pink toes so complacently, thronged on some one's lap at twilight bedtime, before the slumber of the mother? And those little hands, so small and dimpled and so utterly useless, now spread open like a fan, now tightly closed up like a round shell at a word, to open at all what questions of awe and wonder make up our dreams of babyhood? The growth of the mighty feet out of the tiny ones is not such a marvellous mystery as the future of those soft wee hands. Think for a moment that, not in my veins alone, this little hand of the baby girl may be talked of among men, clenching, fighting, some, like in feverish dream, as if it were mine; then, lo! my, it will be lovingly some great strong man with bounding delight, and the sound of the feet upon a stair will be heard in the hall, coming—coming to him who is laid in those days with a bound and a thrill of the heart. Oh! it is a great mystery, that the hand of a baby and the little feet have a rest put to play in many lives, that the hand and under standing will expand and live, and become a centre of new methods of doing, and joy, and grief.

And still more wonderful it is that the most helpless of creatures, whose very helplessness makes half its claim upon us, may yet grow up in all the strength and splendour of a noble human life, and, whether man or woman, may live life's little beauty, a rallying point for the weak, and the guiding power of other lives. Of the genius and light that may lie behind the most dimly-lit eyes, yet, gentlest of eyes we must say nothing, nor do we know then how the world may be changed if it will by some puny nursing that in that moment has, failed to skip with the most questionable wisdom, of helplessness.

## TEMPERANCE BEVERAGES

### IS A COMPREHENSIVE ANALYSIS

It is quite a common thing for the manufacturer of temperance beverages to declare them absolutely free from alcohol, without in the first place ascertaining whether this is so or not. We do not think that this in all cases can be the result of ignorance, for many persons know well that such a declaration increases the consumption of the article they produce. On the other hand, it is undoubtedly from ignorance that some of the temperance beverages containing an appreciable quantity of alcohol put into so freely of them. It is a well known fact that many of the so-called temperance beverages contain a large percentage of alcohol, sometimes as large as that of

beer, and sometimes even as large as that of certain kinds of wine, and upholders of temperance principles should insist, before adopting any beverage for their use, that an analysis should be made by a competent person, and his report appended to the vessel containing the liquid, before sending it into consumption. Such a provision would markedly lessen the number of so-called temperance beverages, while at the same time it would secure to the abstinence a 'non-alcoholic' beverage.

There are a number of persons who make these beverages for private use, and who, ignorant of the changes produced in certain liquids by the methods they employ, believe their beverages are non-alcoholic. The writer has known many such instances. A certain lady once made an infusion of malt, added yeast to it, and allowed it to stand for some days in a warm place, and yet was not aware that it then contained alcohol. She flavoured it sweetly, and distributed it among a circle of temperance friends as a non-alcoholic drink. A gentleman—a chemist, and an apostle of temperance—made a solution of sugar, added some yeast and hops, and allowed the liquid to ferment for several days, and then supplied the solution to his flock with it, ignorant that it contained even a trace of alcohol. Many such instances are known, and on behalf of temperance we will remind all such that any infusion of malt or solution of sugar is almost certain to change a pattern of its substance into alcohol when subjected to a healthy fermentation.

There are many difficulties in the way of the manufacture of purely non-alcoholic drinks. It is desirable that they should be wholesome, but they frequently are positively injurious to health, from the use of flavourings of a deleterious nature. It is desirable that they should keep for some time, but beverages such as imitation of beer, and of some of the best of the imitations of which beer is made, cannot be produced under ordinary circumstances in the absence of alcohol. It is unfortunate at the present time the tendency of temperance to urge manufacturers to endeavour to give their products the appearance and even the flavour of beer. The cause is for many reasons to be deplored, and in the absence of healthy and better beverages, the writer would strongly recommend the use of such drinks as milk, &c., &c., and would respectfully draw the attention of temperance reformers to the comparatively small number of houses where they can be had. An increase in the number of these houses would probably do as much for the spread of temperance as any other measure adopted.

## FOR HIMSELF ALONE

### A TALE OF REVEREND IDIOTISM

#### CHAPTER II. CONCLUSION

SEVERAL had Mrs. Pemberton finished giving her father an account of Captain Dymally's proposal, and of the intended runaway marriage, when they reached the glade in which the picnic had been held. Here, a few moments later, they were joined by Mrs. Pemberton, Dick, Mr. Dampney, Proboscis, and Captain Dymally.

Mr. Leyland and Elma, who had, as already

narrated, set out for a short stroll in the wood, did not go far before they turned. Elma was afraid that the others would be waiting for her, besides which, she had a woman's curiosity to learn the nature of the good news which Leyland had brought her friend. They saw the others before they themselves were seen.

"There are Mr Froisher and Mr Drummond," said Elma.

"By Jove!" exclaimed the painter, in genuine surprise, "what swells they have blossomed into! I should hardly have known these again. O Richard, Richard! whether have thy kinsmen been vanquished?"

Miss Elma began to think her companion something of an idiot.

Leyland emerged from the trees, and stepping, quietly up to Drummond, who was only a few yards away, he slipped him on the shoulder. Dick turned quickly, and stood like a dumfounded at the sight of his friend.

"Why, Dick, dear old Dick, how are you after all this long time?" said Leyland heartily, as he gripped the other by the hand. "It seems ages since I saw you last—think you my life, a word in your ear?" he asked in a lower tone. "Your picture in the *Illustrator* has found a purchaser. A Manchester firm has taken a fancy to it, and he talks about commissioning you to paint another."

Dick's face changed first to white and then to red. He gaped with a few unheeded words, but he could never remember them and what they were.

At the sound of Leyland's voice, Froisher, who was standing a little apart talking to Elma, turned his face to, and changed for a moment. "The crime has come upon" thus he expected, he whispered to him all *Nonpareil*. "Picture" then later on, perhaps. He went forward with a pleasant smile and laid out his hand. "Don't forget that there are two old hands here, in and to Leyland!"

"Indeed! Not likely. But I had some good news for Dick which I was in a hurry to tell him—And now, my dear Frank, how are you?—better—better. I can see that before you were not. Not like the same man. I suppose I must congratulate you on your good fortune." He paused for a moment, holding the other's hand in his and giving a little waltz into his ear. "Ah, Froisher, I don't know whether to feel glad or sorry that you have come into all this money," he said. "Many a fair spirit has been spoiled by coming into a fortune."

Every one present heard Leyland's words. They all stared, as well they might. Was this man in the shabby tweed suit drunk or crazy? Of a surety he must be either one or the other.

Mr Plowth's penurious cheeks turned the colour of saffron. Striding forward a step or two, he touched Froisher lightly on the arm. "Why I ask you this question is, Mr Drummond?" he said in a hoarse whisper. "He seems to be confounding your identity with that of my nephew most strangely."

"This gentleman is Mr Bruce Leyland, a very dear friend of mine, and I am not aware that he is confounding anything."

"But he called you Frank Froisher?"

"He called me by my proper name."

"But—but you are not—"

"In fact, but I am, Mr Plowth. I am Frank Froisher, and you may verify it here."

An examination of fingers, a dirty business from the lips of all present except Leyland and Dick.

In a moment or two, Plowth stared blankly at the stern young face before him. Then, with a lightning flash, the truth burst upon him. "Great heaven!" he cried, reeling, unsteadily round. "He is Frank Plowth, not the syllable as if they would choke him. With one hand pressed to his forehead, he sat, and rather than walked to a tall tree, and there sat down. His wife and daughter were by his side in a moment, but he warded them impatiently, even fiercely away. He sat staring, with blank eyes at every present he took a bundle of papers from his pocket, under which trembled, under the red tape that bound them, and began to turn them over in an unsteady nervous sort of way. Now and then he repeated under his breath the words "linked" "linked." It was a ghastly sight.

"Mr Froisher changed into Mr Drummond," exclaimed Dempsey.

"Mr Drummond changed into Mr Froisher," cried Elma.

"Why did change into my cousin Frank?" murmured Elma, who was so much bewildered.

"(The man who) who could have believed such a thing?" said Elma and Dempsey in a helpless sort of way. The situation was so novel, it tells and it is, that they were evidently at a loss what to do next. Elma said nothing, but it was with all her eyes at the little caption. "What not then a most surprising turn of affairs is put to some extent her mind. Dick Drummond put it."

Drummond drew Leyland aside, and explained to him the state of affairs.

"You are really my nephew Frank after all!" said Mr Plowth, with the old but new to Froisher. "I told you from the first that none of our family had any right to live in this."

"Yes. I am your nephew Frank. There's no mistake on that point this time, aunt."

"Well, I always did like you, so I've said many a time, when others were maybe running you down."

"Yes, we always did like you," said Elma, tapping him playfully with the point of her sun shade.

Always, echoed Dempsey and Elma, who had moved closer up.

"I don't know that I can like you a bit better than I did before," continued Mr Plowth. "And is for your friend—what a nice young man he is!" I am sure I don't like him a bit less than I did half an hour since, he was he happens to be poor and unconnected with the family."

"Mamma, dear!" said Elma imploringly, with a look at her mother's face.

"Aunt, you have one of the kindest hearts in the world," said Frank, and with that he stooped and kissed her.

Dempsey and Elma looked straight over each other's shoulders, and seemed to be gazing into infinity.

Clunie turned to Frank with what she would have called one of her "sach" glances. "You naughty, naughty man! play us all such a trick! But I was never really deceived!"

"No, we were never really deceived," chimed in the Clunies.

"Any one could see that the real Mr Drummond was no gentleman!" Then from Clunie.

"Always had the air of a pinner!" Then from Dempsey, whose father had been a successful bacon contractor.

"Something extremely pkinish about him," yapped Dyson.

"We could tell the son most sincerely," continued Clunie.

"Yes, we congratulate you most sincerely," echoed the Clunies.

"My dear, kind friends, how heartily I thank you, and put myself in your debt!" responded Frohman with a ring of unworldly merriment in his voice.

Clunie turned to her mother with a joint Mr Dempsey's purple fur became still more purple, he coughed behind his hand and walked away. Captain Dyson let his eyes drop, then he pulled up his collar and pulled down his cuffs and tried to look at it. He was about to follow Dempsey, but Clunie detained him. "After all that has happened, do you still love your little Clunie as much as I expect?" she whispered (till Clunie indeed! she was a head taller than the Captain).

"As much as ever, my dear child. And that reminds me that when I was at Burslem post—"

"She put her hand within his arm, saying it a little nearer to the fact so. "Let us sit down this afternoon," she said, "where we shall be quite alone."

Frohman was so much interested in Mrs Clunie, when Mr Polworth interrupted him. That gentleman had to come out at all times his assurance by this time. Pushing after all, he reflected, things might not turn out quite as desperate as he had at first believed they would. In any case, his best plan was to put a bold front on the affair.

"You must permit me to congratulate you, my dear Frank," he said with a wily smile, "on the really admirable style in which you played your character of the poor minnow. It was a marvellous piece of acting, and you must allow that I did my best to second your efforts. Of course I saw through the little deception from the first—let me tell you the very first. Admirably acted!" So true to life!

Frohman was no effort to hide the truth and looking which the words excited in him. "Mr Polworth," he said, "if there is one man in the world whom I hold in more utter contempt than I do another, you are that man!"

"For he was a wife, not a child!" My wife and daughter are close by."

"I changed places with my friend in order to try you. You know the result. I believe you to be an ingrate! I hypocrite from top to toe. I know you to be a liar—selfish, cunning, and utterly unscrupulous!"

"Not a word, I implore you!"

"You have spoken of your wife. What is not for her, I would expose you to the world in your

true colours. My aunt is a good woman, whom I respect and love—you, I loathe. For her sake, I choose to remember the relationship between us, and to keep silence with regard to the past. You know my opinion of you, it is one which nothing can alter, and the less you and I see of each other in time to come, the better it will be for both of us."

"If my gratitude!"

"For what, Mr Polworth?" The word is profaned when it comes from the lips of such as you!" With these words, Frohman turned on his heel and strode to where the three ladies were standing, wondering and bewildered spectators of all that had happened during the last few minutes.

Never in his life had Mr Polworth felt so crestfallen and humiliated. Yet even in the hour of his extremity the brave husband of the man did not quite desert him. Taking out his pocket book and pencil, he scribbled in a corner which was purposely loud enough for all present to hear. "I quite agree with you, my dear Frank—quite. I will write a memorandum of the matter at once, and consult you with reference to it in ten days!" With that he went back to his seat on the sofa, and with a picture of being busy with his pocket book and pencil.

Till now, Mrs Clunie had not spoken a word—she had, in fact, moved a little apart from the others. Frohman now went up to her and took her hand. "Listen!" he said, and there was a wild gleam of triumph in the way he spoke that one little word.

"Well, yes!" and without raising her hand, she looked up into his eyes with a sort of cold surprise.

"I will, I trust, forgive my little deception for the sake of the valuable lesson to his tongue."

"Antiquary, Mr Polworth, I am sure of what you mean may be, what is the particularly valuable lesson it has taught you?"

"It has taught me that your love has been given me for my sake, and it has taught me that there is one true heart in the world who, in having me poor, would have given up every thing for my sake, but who, now that she knows I am rich, will not love me any more than she loves the dog to which I have put her."

"You make yourself far too much on that point. I have treated me shamefully, and—yes, shamefully!"

"In what way have I treated you shamefully, Emma?" asked Frank with much cold wonder.

"You do not seem to expect that I was going to marry a dear, delightful, poor young man, with whom I should live happily, struggling, Bohemian out of charity, in two or three rooms, on a pound or two a week, doing my own mending and mending my own clothes. Instead of this, I find myself tied to a commonplace, vulgarly rich individual—just the kind of person that every girl is expected to marry. I call it shameful—shameful!"

Frohman looked at her as if he scarcely knew whether to be amused or annoyed. At this moment Mrs Polworth came up. "What's the matter now?" she asked, seeing that something was amiss.

"Lima has been making use of bad language

because she finds that I'm no longer a poor man!

'More fool she,' answered Mrs Peabworth with a touch of spirit. 'If she hasn't sense enough to keep a sweetener out when she's got one, whether he's rich or poor, she'll soon find somebody else in her place. Why, half the girls in the county will be setting their caps at the owner of Waylands before three months are over.'

'Miss Dene poked up her ears. "I've aunt What a character you give your ex," she said.

'It's no more than our sex deserve, my dear. There will be quite a competition for Mr Froisher, I can tell you.'

'In that case,' said Eliza whimperingly, 'I may as well keep him for myself. Not, you know, because I really care very much for him—but just to spite the other girls.'

'There's an awful man!' (gasped Mr. Peabworth.

'Then your dearest Eliza will consent to accept me—but not for me, I hope?' said Froisher.

'No, not for me—but for ever and ever, in wedded bliss, placing both her hands in his, while the love light of happiness shone in his eyes.

What little remains to be told may be told after a very brief pause.

'I have got the best share of his life—a rich husband, who has a thousand times as much as I had. I have got the best of the doctor of his life—a man who is a blessing. Mr Peabworth was distinguished at first, but calculated a magnanimous forgiveness to the newly married couple on their return from their honeymoon. Captain Dene came down handsomely in the way of settlement, but to this day he cannot understand why his wife, who had hitherto been one of the most complaisant of listeners, changed so suddenly and unaccountably, and refused just then to listen to any more of his business, even going so far on one occasion as to impugn the accuracy of his memory and to make use of the words "bustle and rubbish." The little man spends much of his time at his club but nobody has asked him for his own. He has the look of a man habitually uncared for and despised. Now and then a gleam of happiness reveals him—when he can button hole a stranger good natured enough to listen to him while he narrates some of the surprising adventures of his early life. Young Tom McMurdo, whose state of chronic impotence is no secret, ate many a good dinner at the Captain's expense, and brought many a sovereign as well—which he takes particular care never to repay—and all because he is the best of listeners, and never even hints the shadow of a doubt as to the truth of what is being told him. It has never dawned on the consciousness of Captain Dene, and probably never will, that in him Nature created a host of the first intentions.

One morning very soon after the pact, Mr Peabworth intimated that business of importance would take him to Liverpool. He had not been many hours in Liverpool before he telegraphed that the business which had taken him to that city would take him still farther—as far even as to America. Mrs Peabworth

was delighted, the voyage would be quite a holiday for Algernon, and the sea breeze could not fail to benefit his health. But Mr Peabworth's business, whatever the nature of it might be, evidently required a long time to bring it to a conclusion. Month after month passed away, and Mr Peabworth with him that he still found it impossible to return. At length, at the end of a year and a half, he disappeared with the whole affair, he died, so that in all probability the business which took him so far will remain unsettled till Doomsday. His widow mourned for him in a sincerely. To her he had ever seemed the best of husbands and the best of men, and nobody has been cruel enough to try to undecieve her.

Within a week of the pact, Dick Drummond was back in his old rooms in Fother, which had found no tenant during his absence. At first he felt a trifle dull and lonely without Froisher, it seemed as if he had lost a part of himself, which nothing could replace, but England looked in every other evening or so to cheer him up, on which occasions they caused innumerable pipes together and discussed on every subject under the sun. A few other Bohemians would drop in occasionally, for Dick could now afford to keep open house, and with a song was sung, and many a merry story told at such times in the dingy old room. But neither to Dick nor Froisher would the wheels of life have seemed to run pleasantly unless they had been able to see each other often.

It was but an hour's journey from Watford, and Froisher was frequently in town. His old easy chair, his old music library, and a hearty grip of the hand, always waited him in Fother. At such times, time would elapse with him, at which times Dick would put down his book and palette for the day, come out his golden lark, and on the other side, and go in a twinkling for high jinks.

But Watford did not fail to see Dick a frequent visitor. It was understood that he should spend his Saturdays till Watford there—or longer, for the matter of that—it often so he should feel so inclined, and summer or winter, few week ends passed without seeing Dick, exchanging the smoke of London for the pleasant breezes of the Surrey hills. He seemed nearly as much at home in Watford as in Fother himself.

As a painter, success came to him in such measure as he desired. He had a happy facility of seeing and of being able to reproduce in other words, some little, true or incident of everyday life with its touch of humor or pathos, or both combined—some commonplace episode of the great common life—where most people would pass by with unobtrusive eyes. One such picture of humble life it was that brought him to the front. A certain well known reputation in it, brought it, and caused it to be engraved. The engraving became popular, and had a large sale among that humble class of art lovers who cannot afford to buy pictures, but who like to see their walk home with a few good prints or engravings which tend, in one form or other, to illustrate that one touch of nature which is said to make the whole world kin.

Dick had found his ground at last. There was a demand for his pictures for engraving purposes.

No one could have been more surprised than the artist himself was.

'You have hit the right nail on the head, and no mistake,' said Lancelo Leyland to him one day. 'Now listen to the advice of an old oil painter slowly, try to make every picture an advance on your last one, and above all, don't flinch the market with your works. It is far better to paint one good picture a year, than half a dozen indifferent ones.'

Dick has not failed to profit by this advice, and the world prospers with him. But to this day he believes in his secret heart that Nature mislaid him for a delusion of mythical subjects on a grand scale, and he never gives on his *Academic* and other kindred credits which still adorn the walls of his studio, without a brief regretful shrug of the head.

Of his later and finer, what remains to be said? To no man is it given to withstand the drifts of fate, but with youth, health, and a love that knew no winter or change, thus chosen of happiness were greater than are granted to most mortals. More than that could not be expected of them.

Forbush's pen is by no means idle, and, in the older days, he still writes in the artistic pleasures and pains, disappointments and delights incident to a literary career. There is a new prospect of his yet coming, *How we Live*, written six years ago, and expected by several London magazines, but, through produced at the end of last July. What was an impossibility in the case of an ordinary literary hack, may have become a possibility in the case of the well-to-do owner of Whitby. In matters like these, as in so many others of life, there are generally wheels within wheels.

# BOOK Gossip

THE theory of evolution, so joyously by Darwin, and referred to with enthusiasm by Wallace, Huxley, Lyell, and Lubbock, is one which few people who would wish to be abreast of the intelligence of the time, can afford to be ignorant of. This theory is as yet in its infancy, outside the range of considerations, hence it is all the more important that persons who have not the leisure or the desire to study biology for themselves, should have the means placed within their reach of forming an intelligent opinion on a subject which is constantly presenting itself before them in one shape or another. A volume from the pen of Dr Andrew Wilson—(*Chapter in Evolution* (London: Chatto and Windus)—will, we venture to think, go far to supply this want. The author participates in giving so much prominence to the arguments in favour of, and so little notice to the objections that have been and are still urged against, the theory of Evolution, but there is to be accounted for by his evident conviction that this theory is already proved to be true. Darwin himself, with his wide range of mental vision, and his comprehensive knowledge of natural development, was able to perceive and always ready to acknowledge that the doctrine he advanced was not free from our objections—he did not indeed put it forward as a fact, but as a hypothesis, which he supported not as

absolutely proved, but as being able to account for more of the phenomena of living things than any other theory that had as yet been advanced. Dr Wilson, however, as the result of his study and observation, is prepared to take the question out of the region of the hypothetical, and to place it in that of the actual—in short, to assume, to use his own words, 'the reality of the process.' In this view, therefore, he has endeavoured to marshal the more prominent facts of zoology and botany in order to prove that evolution is an actual factor in the life work of the universe.

Drawing the argument upon a few apparently simple propositions: (1) Every species of animal and plant has a tendency to vary from its original type, each individual offspring having a certain likeness, and a certain unlikeness to the parent. (2) These variations are favourable to offspring. (3) More animals and plants are produced than can possibly survive, hence (4) there exists a 'struggle for existence' among the living individuals, those which are adapted to the conditions of their surroundings, or environment, outlasting the weaker, which result from the doctrine of the 'survival of the fittest.' (5) The variation is a kind of descent, in process of age, so that in the original type is contained the new species, there being, in this way, a definite basis between one species and another, and following which is a kind of development, it is assumed (6) that all the forms of living things which we have now are derived, in any line from evolution, from a few primitive forms, possibly from one. It is then these propositions, thus roughly stated, form the basis of the great theory of hypothesis of evolution, as would limit and restrict it. (Chap. I. Darwin. In Dr Wilson's book, there who has written the book with such detail, well had an intelligent and easily comprehended guide, and if they are not, by the practical, convinced as firmly as Dr Wilson is, of the truth of the doctrine therein set forth, they will at least be in a position to reach the subject apart from the absurdities and difficulties which have so frequently by unthinking opponents been attributed to it.

\*\*\*

A second volume of the series of books on *How we Live* (London: Chatto and Windus) has recently been issued. It is with *Evolution*, and is written by J. C. Norton, B.A., of St John's College, Cambridge. It is a volume of very great interest. Not only will the reader gain from it a knowledge of the lives of leading astronomers—Copernicus, Tycho Brahe, Kepler, Galileo, Newton, Laplace, Leverrier, and Herschel—but he will derive a clear and vivid conception of the science of astronomy itself, rendered specially intelligible by its being presented to him in historical sequence, thus enabling him not only to mark the progress from stage to stage, but also to comprehend more fully the value of the discoveries which the several great men whom we have named contributed towards our knowledge of the starry world. If the other volumes of the series are as thorough in conception and as attractive in style as those already issued, the whole

of milk is larger and better than upon the food formerly given to them. With the addition of some oilcake, varying from 1 to 1½ lb. per cow per day per head, their condition improved very materially. The cost of skim-milk in the crop and conveying it was about equal to the cost of making it into hay under favourable circumstances, but those present who understood farming thought that this cost could be very much diminished. Great stress was laid upon the fact, that under this system, whether was an object, in the crop can be stored green, wet, or dry. Some butter was shown to and tasted by those present, and the preference all round was for that milk from the cows fed on the ensiled fodder. The top layer of fodder in the silo is highly mouldy, and it showed signs of fermentation—in evidence of insufficient covering and pressure, but the deeper the cut into the body of the silo thus stored, the better was the food.

As an example of the curious property of plants in selecting from a soil only those materials proper for their nourishment, we saw that the *Asplenium*, which is found abundantly on the Moctarian in our area. It has lately formed the subject of some experiments by Mr. Munton, who has cultivated it for many years. Its growth seems to derive from the little vesicles filled with water which cover its stem, and have much the appearance of blown dewdrops. Analysis shows that it sucks up from the soil a large quantity of soda, potash, and other alkaline salts, indeed, it may be said that the plant represents a solution of alkaline salts held together by a gelatinous mass only weighing two per cent. of its mass. Mr. Munton believes this is the principle by which many other plants, thereby becoming, what such salts are in effect, thereby becoming, the ground suitable for ordinary cultivation.

The Hon. the Secretary of the Court Society has recently given some interesting particulars as to those animals, which have long been valued for the institutions and curators in parties of the milk they yield. Twelve years ago, he tells us, few goats could be found which would give more than a quart of milk a day, but now, owing to the care which has been expended upon their breeding, specimens are produced which will yield three or even four times that quantity. Much animal complaint goes on among the goat and ten pound, and when once acquired, are found so valuable, that they are not readily parted with. He says—and his conclusions are based upon many years' experience—that goats in this country do best when housed by the day and night during the autumn and winter months. The quality of the milk is in no way affected by such confinement, and if properly treated, the still fed animal will yield a far better return than one not having the benefit of shelter and warmth. The Zoological Society have just lost by death from mania an old age the female hippopotamus which was presented to them by the Viceroy of Egypt thirty years ago. She has survived her mate—which lived twenty-seven years in the Society's Gardens—by about six years. It would thus seem that the span of life allotted to the hippopotamus is about thirty years, probably a good deal less when exposed to the vicissitudes of a wandering existence.

The splendid collection of living animals in

Regent's Park, now numbers between two and three thousand. One-tenth of these are reptiles, and from want of proper accommodation, they have hitherto been located in different parts of the Gardens, much to the inconvenience of those who wished to study them. There is now, however, being built a new Reptile house, in which the various members of this large family will be brought together. The difficulty of planning such a scheme will be understood when we remember that reptiles from all quarters of the world have to be considered, and that a temperature necessary for the life of one species would be quite inadvisable for the requirements of another. Bearing this in mind, the cage, as rather less was used to contain the specimens will be each heated to a proper temperature by special arrangements of the hot water pipes employed for the purpose. At the same time, artificial will be the natural atmosphere. The new building is expected to be ready for occupation by next autumn.

Those kindly disposed and well-meaning persons who showed such friendly feelings towards poor Jumbo, and advised the Council of the Zoological Society with such cordial motives in seeing him across the Atlantic, all perhaps acknowledged that the Council were right in believing that the large creature was becoming dangerous. Since reaching America that Jumbo has turned his keepers into mischief, and has shown other signs of obnoxious behaviour.

A paper has been read before the Entomological Society of Britain giving some interesting particulars relative to birds and telegraph wires. In such districts, the smaller birds in Germany are very fond of roosting both in poles and wires. As all are frequently build under the wires, which wires run into telegraph offices, and actually stop work by causing contact between the wire and some neighbouring body which will carry the electric current to earth. Contacts with a like result are often caused by large birds alighting on the wires and causing them to swing to, thus and touch. Woodpeckers frequently peck holes through the telegraph posts, and no kind of precaution of the wood seems to stop them from doing so. Sulphur, copper, varnish, mastic, chloride of zinc, and other poisons have been applied to the wood as preventive measures against it, but the birds pick away at them all the same. At the recent Electrical Exhibition at the Crystal Palace, a pair of these pecked poles were shown. The theory was then broached that the woodpeckers mistook the vibration of the attached wires for the hum of insects, and attacked the post with the notion of getting at them. This theory is now combated on the ground that the poles are frequently infested with insects. But wood saturated with the poison named is not certainly to be expected. The woodpeckers have evidently not yet found this out.

The curious little girl about seven years of age who has been for some time put exhibited as 'the man-eater' at the Westminster Aquarium is worthy of a few passing words. According to Mr. Lamm, who exhibits her, she was brought from India to England by Mr. Gul Bok, the energetic Newsgang traveller, whose

movements we have more than once noted in these columns. Mr. Bock having heard of a race of hairy-tailed men in Sam, offered a reward for the capture of a specimen. In the result, a man, woman, and child, all covered with hair, were obtained. After some difficulty, Mr. Bock brought the child to Bangkok, and obtained permission of the king to bring her to Europe. The little girl, who is called Krio—which represents the plaintive cry addressed to her by her parents when she attempted to wander from them—is intelligent looking, with large dark eyes, thickened nose and pouch-like cheeks. The hair on the head is thick and straight, and is continued down the cheeks like whiskers, the face, arms, and shoulders being covered with hairs from an inch to an inch and a half long. There is said to be a prolongation of the lower vertebra suggestive of a tail. This curious and interesting little creature will no doubt give rise to much discussion among certain of our learned societies.

A very curious application of photography has just been brought before the Photographic Society of Great Britain by Mr. W. M. B. On what are said to be for some years our continental neighbours have been teaching deaf and dumb persons to speak by training them to watch the movements of the lips when any one is talking to them. This method of reading sounds by sight has been highly successful, and has long ago been introduced with similar results into this country. The idea has occurred to a foreign teacher of the dumb to photograph the movements of the lip when articulating the different sounds which **make up ordinary speech.** It will easily be imagined that the model chosen for the pictures must be some one whose lips will give expressive return. But once photographed, the pictures can be multiplied by the thousand, and can be used as alphabets for our afflicted fellows all the world over. It is said that the pictures are so well adapted to their purpose, that any one can see at a glance what sound is indicated by each lip movement portrayed.

Another useful application of the same art is furnished by Dr. Gill, who is in charge of the Observatory of the City of Good Hope. He suggests that star maps could be made by aid of the camera, which would be far more valuable than those of the ordinary kind drawn by hand. That the light from the stellar depths is powerful enough to impress a modern photographic film, we know by the results of Dr. Huggins, who has photographed the spectra of a great many of these distant orbs, as well as the corona of the sun itself. The light available when dealing with the objects distant would, **of course,** be far greater than when their spectra are concerned. We may mention that Dr. Gill was most successful in the photographs which he obtained of the recent comet, one picture showing more than fifty stars through the luminous tail. Although the most sensitive process is used for this class of work, an exposure of more than two hours was required for some of these pictures. The camera is attached to a telescope, which latter is so beautifully regulated by clockwork, that the image of the object photographed is kept steadily in one spot, regardless of the movement of the earth in its ceaseless rotation.

The National Health Society, London (44 Bevis Street, Oxford Street) have been exhibiting a fever patient dress, intended for the use of those whose duties bring them into contact with infectious maladies. It consists of a kind of overall made of mackintosh, which is glued inside and outside, with a hood attached, so that the body, with the exception of the face and hands, is wholly enveloped in its folds. **Of necessity,** it is perforated in the nose, through which no germs can pass. The fit of the face and hands being exposed is not considered a material disadvantage, for these parts can be readily washed with a disinfectant. The object sought is to enable the wearer of the dress to go into fever-stricken rooms without the necessity of changing clothes afterwards. The dress can be readily removed with disinfectants at the end of the day and is then ready for use.

Mr. Lunt's paper on the Mutual Inspection of Houses, published in the *Society of Arts Journal*, was full of valuable hints, which, if adopted, would tend to remove all taints of one kind or kind or kind from our dwellings. It will be remembered that **Professor Lunt** has been successful in securing that houses should be subject to inspection by experienced men, and that **houses should be insured** for the purpose. His paper of Mr. Lunt is an account of the work actually done, and of the very deplorable state in which some of the best houses in London were found to be from a sanitary point of view. He summarized the objects aimed at in careful house drainage as follows:—(1) All rubbish placed in any of the sanitary appliances in the house must be carried with the greatest possible expedition clear of the premises, leaving behind it as little deposit as possible. (2) All water must be prevented entering the houses by the channels which carry it away by the sewage. (3) Since it is impossible to have house drains absolutely clean—that is, devoid of all decomposing matter—all air from house drains, and even from sink, bath, and other waste pipes, must be kept out of the dwelling rooms.

On the 9th of January, Mr. James Brunel, delivered his inaugural address as President of the Institution of Civil Engineers. He showed that the art of construction had made small progress until a very recent period, and that the ancient undertook work of a stupendous character in the shape of canals and tunnels, which were not surpassed for many centuries. A review of the last engineering undertakings was completed or in progress throughout the world and followed. The bridges over the Tay and Forth, the St. Gothard Tunnel, the Severn Tunnel, various harbours, projected railways, the Panama and other ocean canals, the application of different kinds of illumination to lighthouses, each claimed a share of careful attention and interesting remarks. Mr. Brunel pointed out that the trained engineer was quite a modern creation. Little more than a century ago there were no engineering works in Britain which were worthy of notice—hardly a canal or a possible high-road, and two centuries ago, it was necessary to send to Holland for an engineer to build a sea-wall.

By the combined action of cold and pressure, carbonic acid gas can with comparative ease be

reduced to the liquid state, and a strong iron bottle containing such liquid may be looked upon as so much stored up energy ready for use. A gas if many plans have been devised for working engines with this gas instead of steam, but they have been found impracticable and expensive. A useful application of the principle has lately been tried with success by M. de Witt, head of the Berlin Fire Brigade. The steam fire engines are supplied with a mixture holding liquid carbonic acid, which can be applied to the pump at a minute's notice. The advantage of being able to pump water on a fire without the delay of getting up steam, is very great, when we consider how important the first few minutes are in a case of fire. Of course the gas is quickly considered as a useful ally, until the boiler is sufficiently heated to supply steam.

Carbonic acid gas has long been used in the very serviceable little fire engines called the Kalmars, and its force is sufficient to propel a stream of water a gas distance without the aid of any pump whatever. Another modern application is the gas in that novel engine of war called the Lay Torpedo. This is a fish-shaped shell containing twenty six feet in length, and when loaded with its terrible charge of twenty pounds of dynamite, weighing one ton and a half. The little engine which propels it on its mission of destruction is worked by carbonic acid gas. Its course can be regulated by wires from its steering point, and it will go for a mile and a half before its motor becomes exhausted.

An interesting account of the Bihmer sponge trade is given in a Report by the American Consul at Nicosia. The trade employs several thousand people, and about a hundred vessels to fish for the sponge. Of these there are several varieties, which have different values and names, which seem to be given them according to their resemblance in texture to other things. Thus, one description of sponge is known as Sheep's wool, another is called Velvet, and so on. Each vessel employed has a crew of from six to twelve men, and their work is carried on in waters so shallow and polluted that the sponges can be seen on the bottom, and men from their decks by hooked poles. Sometimes diving is resorted to. The sponge as it rises out of the water is covered with a soft glutinous substance full of organic life. Spread out to dry, this matter purifies and causes a horrible odour. Afterwards, the sponges are packed up in a kind of cage on the shore, so that at every tide the water will cleanse them. They are then washed, treated with lime, and dried, when they are ready for exportation.

At a meeting recently held at Manchester to discuss the advisability of an increased supply of paper for the press, it was stated that a Company had been formed to develop a concession by the Bey of Tunis, giving rights to collect esparto grass grown in certain districts. It was stated that thirty thousand tons of the material were available annually from one territory alone—that of Bouhedma. Such grass, with modern appliances for compression, transport, and shipment, could be delivered in Liverpool for little more than half the price per ton which Essex grass commanded last year.

The Council of the Institute of Painters in Water colours desire it to be known that they are about to carry out a scheme which has been long under consideration, but which want of spirit has compelled them hitherto to forgo. Finally, their galleries in Piccadilly, London, will be thrown open to all exhibitors in water-colours. Secondly, they will open schools for the free education of students in the same branch of art. Intending students will be required to send in drawings as a test of their efficiency, as their study instruction is not contemplated in the school. The British School of Painting in Water colours is a distinct and very beautiful branch of art, and the generous action of this Institute—now more than half a century old—will give it renewed life, by attracting numbers of young students to its portals.

We have more than once referred to the new method of blasting coal by the heat and expansion caused by waiting cartridges of compressed lime. A German brewer of Nuremberg, says a contemporary, in aid of the lime process for mining coal, proposes to use gas as an agent for blasting rocks. He has in his experiments blown strongly heated gases into pits, and forced out one end of his brewery. He desires to make experiments in the Cornish mines, the use of which will set up fermentation the moment the first charge is laid, which fermentation will soon become so active as to overcome every resistance.

The American Consul in Paris has done good service in calling the attention of his government to the wholesale adulteration and falsification of wines, which has now assumed an alarming aspect in France. Although important matters are subject to analysis at the Customs before delivery to owners, and if found adulterated, can be stopped, no such supervision is exercised over the wines which leave the country, and which, it would seem, in more cases than one, have it for that country's good. In 1881 some three thousand samples of these exported wines were analysed. Our faith of these was pronounced to be good; three tenths were passable, and the rest were bad, some of these last being positively injurious. We have neither space nor inclination to give a list of the various substances employed to imitate the juice of the grape, but as a specimen of what can be done by the dishonest trader, we may mention the constituents of a liquid which is largely exported as wine. It consists of water, vinegar, and logwood, with our tenth part of common wine to give it a flavour. The time is fast approaching, when analytical chemistry must form a part of everybody's education.

Another pest, but of a vegetable character, forms the subject of a bill recently introduced into the New South Wales Legislative Assembly. This bill is to empower the government to devote a sum to the eradication of the wild cotton or 'paukly pear'. This plant has grown so rapidly over the country that it threatens to choke out of existence its more useful but weaker brethren. One proprietor is stated to have spent one thousand pounds in endeavouring to purge his land from the intruder, and it is estimated that the government if they delay long will have to devote at least one million sterling to the same purpose. Thirty years ago, fifty pounds would have been

almost sufficient to rid the country of this mischievous plant.

According to a pamphlet published by Mr. Ellwood Cooper, the cultivation of the olive in California has in his hands proved a remarkable success. The trees begin to pay for their cultivation in three years, and continue to give larger and larger profits until they attain a great age. In Ana Minor, we are told there are olive trees which, still in full bearing, are known to be twelve hundred years old. Mr. Cooper's best trees are eight years old, and yield two thousand gallons of berries to the acre. The oil obtained from this quantity represents a value of two hundred and fifty pounds.

## A WATERING-PLACE ROMANCE

MANY readers of *Chamber's Journal* have probably visited a well-known watering place in the Highlands of Scotland. The watering place referred to is, by reason of its very unique, picturesque and romantic looking, the rugged, rugged of the hills rising yet harmonious, in beauty with the gently curving, slopes and wooded declivities of the valley below. There are many charming walks, and nothing can be finer than a morning walk when, from the heights, we see the sunlit diffusion, itself, displaying the most that hangs like a veil of summer over the scene, warming every object into new beauty, and making the rough and rugged boulders shine like jewelled thrones of gold.

In the summer of 1880, among the gay and well-dressed crowds who every day thronged the Pavilion, or sat on the seats ranged round the vases of the spa, or 'Wells,' as it is commonly called, might be seen a tall, dark-haired, and comely woman of about forty years of age. At a glance one saw she was poor, for her wincey dress was worn, and had been spun and dyed by her own hands. Her head was bare, and her cheeks rickety and apron were rough but clean. She was a humble peasant, who had travelled on foot from her native land to the Wells, receiving what kindly lodging or fire she might get on the way with beautiful gratitude. She was constantly occupied in knitting, and never for a moment did her busy fingers appear to be idle. Her open countenance and pleasant manner, coupled with her industry and apparent need, attracted the attention of several ladies, who became so interested in her that she soon got numerous orders for stockings, and became quite a protégée of her most favoured sitters.

But other eyes than those of the ladies were attracted by the blithe knitter, and here the romantic part of our story begins. A man fit to be a patient at the Wells, and also in lowly circumstances, began to make various attempts to enter into conversation with Mary Kennedy. He, poor fellow, had come to the spa a rheumatic patient, and had been almost decrepit, but had improved considerably. He was middle-aged and unmarried, therefore, 'a lad,' as a single man is dubbed in the Highlands.

Whether he and Mary Kennedy, by comparing notes regarding their convalescence or country, is not known, but at all events, the shy man ultimately drifted into that interesting subject which links experience and togetherness a happy theme all the world over. By degrees John Macneil the Shy man and Mary Kennedy were well in each other's confidence, and in the month of May, with no little ring and blushes than one would have imported from her forty years, told the ladies that John Macneil the tutor from Skye had said he would not, but, I ask one step to Skye without her?

The ladies, after their first surprise, became enthusiastic about the matter, and there and then determined that a marriage, and a very nice outfit, must ensue. With a forethought which reflected credit, they enlisted the sympathy of the gentlemen, who in turn became enthusiastic also, and now the result flows.

The marriage was arranged, and he became enthusiastic too, and doubly so after having written to the respective mothers of the bride and bridegroom, and receiving therefrom satisfactory answers.

The ladies and gentlemen would have given the ceremony performed at once in the place grounds of the spa, but the worthy divine declined to permit such a proceeding, indicating that the holy ordinance must not be looked upon lightly. It was therefore arranged to take place in presence of a few privileged persons in the meeting house where religious services were held.

On the build day, behold the bride drive slowly down from her lodging, on the heights! She sat on a dark white shawl, in a curt dress by a white horse, whose head was decked with a knot of wild flowers. She was dressed in a well-made cloth dress, shawl, and white straw bonnet, while her face was concealed by a long white veil.

After the interesting ceremony had been performed, the happy pair ascended a dog cart which was in waiting, and drove slowly into the enclosed space in front of the spa or pump room. The hundreds of delighted and amused spectators cheered the bride, and when that magnificent titration of pleasure had ceased, a disposition of ladies came forward and presented the bride with several good and useful presents, to help the planning of the new home. A disposition of gentlemen also presented the bride, in with a suit of clothing, a hat, and some other things.

The happy couple seemed overwhelmed with the kindness which had been showered on them, and after expressing their utmost thanks, drove away, amid cheering cheer, this time in the direction of the bridegroom's lodgings.

But the affair did not end here. At night, a dance was held in the ballroom of the spa, the admission ticket being one shilling. To that gay scene our bride and bridegroom drove in state again. It was a grand success. The demand for tickets was enormous, and, truth to tell, had our heroine been a vain woman, her head might fairly have been turned, so beset was she by suitors for her hand in every dance. The ballroom was swarmed in demand, and received great attention from the ladies, and the total amount collected at the door and by

tickets was handed over to him, a sufficient sum to take both himself and his worthy mate home to 'the Isle of Mist' and also help to make their humble abode more comfortable than in their circumstances it could have been.

### OCCASIONAL NOTES

#### BOARD OF TRADE SURVEILLANCE

On a subject of so much importance to the health and well-being of our sailors as diet at sea, the following instructions to superintendents, issued by the Marine Department of the Board of Trade, are deserving of careful observation.

**'Dietary Scale.'**—The attention of the Board of Trade having been drawn to the increase of scurvy on board British ships since 1873, a Report on the whole subject—"has scurvy, Food scales, Anti-scorbutics"—has been recently prepared and forwarded to the local Marine Boards for their observations. The conclusions arrived at in this Report were as follows: (1) That scurvy has been on the increase in British ships since 1873. (2) That lime juice, itself, will not prevent scurvy, and that too much reliance is placed on it to the neglect of varied food. (3) That lime juice, in connection with fresh preserved meat and vegetables, may prevent scurvy. (4) That the dietary scale of ships should therefore include a fair proportion of fresh and preserved meats, to distinguish from salted meats. (5) That more fresh vegetables should be carried, notably raw potatoes. No satisfaction was given why fresh potatoes cannot be carried on board British ships. The allegation that they will not keep good on board ship is clearly disproved by the fact that they do keep on board United States ships, and will keep for a fair time anywhere else. (6) That it is not at present desirable to insert a statutory scale of diet in the articles of agreement with crews sailing on long voyages, though it may possibly be necessary hereafter, unless the shipowners themselves move in the matter. The replies received from the local Marine Boards have confirmed these views, especially as regards the articles of diet referred to therein, and superintendents are therefore requested to take every opportunity of urging upon owners of vessels sailing on long voyages the necessity of supplying their crews with fresh potatoes, molasses, &c., and a larger supply of fresh or preserved meats, in lieu of salt beef or pork.

#### STRANGE FRIENDS

On account of his unsocial disposition, the greyhound is so troublesome as to be excluded from many kennels. A gamekeeper in the North having one of these animals given into his charge, was for a while tormented by its nose and misconduct, and at last became obliged to turn him out to wander wherever he pleased. Now, there happened to be a pig on the same premises which also enjoyed freedom. To the astonishment of everybody, these two formed a fast friendship, so close that they fed together, slept together, and kept constantly in company, without the one ever showing the slightest hostility towards the other. The dog that had formerly kept up a perpetual quarrel among

his own race, now seemed anxious to accommodate himself to the ways of his new friend, while the pig in his turn seemed equally willing to stand high in the favour of the hound. After this state of things had gone on for some time, they came to understand something of the natural gifts of one another. Lying on the confines of a moor where hares and rabbits abounded, they soon began to do a little quiet hunting on their own account. The hound being guided by sight made them by scent, found most difficulty in slaying his prey, and here the pig, which appears to be endowed with an excellent scent, came to his assistance. Knowing what was required of him, the pig would trace the hare or rabbit to its lair, and then wait for his companion to do the rest. Thus, until the hound would sometimes take the pig with one bound, or if he failed in that, he gave pursuit, and when the hare or rabbit was captured, returned with it to the pig, which immediately ate it in pieces, to be amicably devoured together. The keeper, obliged to put a stop to this proceeding, confined the pig, but the hound showed his constancy by following him, first to the sty, where he lived with him steadily on the best of terms. Although the hound could keep over the sty rails with the greatest ease, he never attempted to supply the pig with more than a few scraps.

### INCOMPILED

Is it well when Spring's delirious sweet liveliness  
Mild joy on joy lifts Nature with delight,  
That we, thought which on our lips is twining  
Should be soopless, though we said aright,  
Alas! premature of May, and kiss the shy smiling?

Is it well in summer of the rose's glow,  
And the blue sky, and the flowery June  
That all our summer should be lone and cold,  
And all our morn should be out of tune  
As though we sang of Spring when woods were hoary?

Is it well when merle larks are hummed with hoariness,  
Or yellow with the wealth of Autumn gold,  
That we should wander not again together,  
To reap the harvest of a hope once told  
When life had been a dream and faded weather?

Is it well when clouds burst by descends plumes,  
And joys of home and winter come again,  
That we should miss, in counting o'er our treasured,  
Our tender look—the brightest in the chain?  
Enough! 'Tis the Hand of God that measures

MARRIAGE APPEALS

The Conductors of CHAMBERS'S JOURNAL beg to direct the attention of Contributors to the following notice.

- 1st All communications should be addressed to the Editor, 220 High Street, Edinburgh.
- 2d To ensure return to one of inequality, postage stamps should accompany every manuscript.
- 3d Manuscripts should bear the author's full Christian name, surname, and Address legibly written, and should be written on white (not blue) paper, and on one side of the leaf only.
- 4th Offerings of Verse should invariably be accompanied by a stamped and directed envelope.

Unless Contributors comply with the above rules, the Editor cannot undertake to return unsolicited papers.

Printed and Published by W & R CHAMBERS, 47 Paternoster Row, London, and 220 High Street, Edinburgh.

## ATHLETES

IN TWO PARTS.—PART I.

WITHIN the past few years, public interest has been manifested from time to time in fitful outbreaks concerning the welfare of those who follow the calling of athletes or gymnasts, and a storm of natural indignation was evoked not long ago by some shocking disclosures of barbarous treatment revealed by four or five English lads who were rescued from the custody of a brutal old Arab trainer of contortionists in Constantinople, whose tender mercies they had been sold under the guise of apprenticeship—to put it plainly, sold by their parents. That such agitation is wholesome and desirable from every point of view, no one could wish to deny. Nevertheless, much popular misapprehension seems to exist with regard to this subject, more especially as to the condition of the children, the wretched little 'white slaves' of sensational newspaper articles, who are brought up to the acrobatic business, the existence of this misapprehension being borne out by the tenor of certain proposed legislative enactments which, if carried, will affect the members of this profession to no inconsiderable extent. Some details of the education and routine of this curious class took place behind the scenes, viewed by diligent inquiry amongst the representatives of its different departments, may therefore not be out of place just now.

Since it was only reasonable to suppose that, in their replies, the performers themselves might be tempted to present a one-sided aspect of the case, others—such as their agents and employers—who, while intimately connected with them in all matters of technique, possess somewhat ulterior interests, were questioned as to the accuracy of the statements made, in order to obtain a comparative bias, and the results herein expounded may be accepted as the average of both sources of information, though in reality there were but few discrepancies. He who has taken

the liberty of constituting himself a special commissioner on behalf of the readers of this Journal is a medical man, and can report from personal examination on the physical state of nearly two score juveniles engaged in acrobatic performance on the stage at this time, or in course of training preparatory to exhibition.

It is a fact not generally known that the 'profession' is divided into two distinct branches, each comprising many 'lines' and specialties—*gymnasts*, those who display feats in mid air, as trapez flying, sailing walking, and acrobatics on lofty ladders, and *acrobats*, who practice tumbling upon or in closer proximity to mother earth. Having mentioned this to avoid ambiguity in after description, let us now proceed to trace the thickets of it in its very beginning. An acrobat or gymnast starts a pupil, either to assist in his own trials, or to educate and turn with an eye to profit in the future. Whatever the object may be, and whatever the line of business, which the young man is destined to shoot, the trainer looks about him for a boy of seven years old. Seven or eight appears to be the age which all unanimously agree upon as the most suitable for commencement; older children are not considered unfit for the purpose—indeed, some who are now before the public have begun to learn at double that age—but younger are as a rule refused, 'because their muscles are not properly fixed yet.' The work of training under seven years first, then, are undoubtedly very rare. Nor is there any scientific discrimination required in the selection of a fitting subject. The trainer does not seek for special points of natural aptitude, in making his choice of an embryo athlete. Any youth of the appropriate age, provided he be free from bodily ailment or deformity, is regarded as capable of being developed into a Laetolus, Blondin, or Grimaldi. If two boys, equal in other respects, were present themselves as candidates, the smaller or better-looking of the two might receive preference, but I could hear of no healthy boy ever proving absolutely unfit for the work.

But where is the pupil to be obtained? The trainer may, of course, have sons of his own, or the children of other entertainers may be submitted to him; and it occasionally happens that the workpeople about a theatre or music-hall bring their boys to be taken in, but in the great majority of cases he has to pick up some poor little shabby ragamuffin in the streets. Some vague familiarity of apprenticeship—not legally worth the paper on which it is written—is generally gone through with the relatives, whereby the master undertakes to feed and clothe the boy for seven years in return for the exclusive control of his services during that period, and the neophyte enters upon his course of study forthwith. The trainer's first and chief endeavour is to work up the muscular strength to as great a pitch as possible. With this end in view, the boy is fed well on an abundant and nourishing diet, and ■■■■ may just be mentioned that articles of food are not refused to or rejection of special articles of food, either for themselves or their pupils, according to the parties that one usually associates with the idea of athletic training. They do not, ■■■■ might be expected, perform entirely fasting, nor immediately after a heavy meal, but they live much as other people do, being, persons of circumstances, exceedingly temperate in their use of alcohol and tobacco. The boy is made to take long walks, cold baths, to use the dumb-bells, and to go through various, taking but not excessive exercises on an ordinary gymnasium of rollers, ropes, and bars, such as any schoolboy might despise himself upon. An extraordinary belief prevails that it is customary to rub oil into the joints and to sleep in green blankets, in order to secure pliability of the limbs—a most ridiculous fallacy, since oil, though it may soften the skin, can never reach the tissues beneath.

This kind of treatment is pursued for two or three months without any attempt at 'tying the body into knots' or other time-wasting tricks, but the practice of certain athletic dependents upon flexibility of the articulations is encouraged out of whole hours, so to speak, by the promise of small rewards—not as part of the regular course. A famous 'Trickler' performer, who is noted as a skilled educator of boys for the business, has a regular band of these pupils, and always leaves the means by which they are given to the pupils themselves—so much for the system of the body, so much for the first hand-tying, &c. 'Preparation for the splits' he told me—'doing the splits' is the most difficult preliminary for acquiring the legs until they extend at right angles to the body, which ■■■■ thus lowered to the ground—'surprise for the splits, and I never knew any boy yet who didn't let the money in three weeks from the day he began to try.' The little fellows like the fun of the thing; and the spirit of rivalry, when several train together, is very conducive to their rapid acquisition of tricks. They measure their progress each by inch day by day, and every one is eager to prevail his own as the 'biggest on record,' when comparisons are made. ■■■■ is frequently found, therefore, at the end of three months that they are already fit to be taken before an audience, though their practice of regular work has really not yet commenced. For instance, if a boy could do nothing but the splits,

that in itself would be something, but by lying flat and clasping the extended feet with his hands, he becomes a 'pancake,' and without any further effort on his own part might be bowed and twisted about by a man in half a dozen different tricks. The first thing the master teaches him is how to fall—how to save himself from injury if he 'moves his top,' and as the dexterity displayed in the evolutions is nearly an exaggeration of human suppleness and agility, and does not depend on morbid dislocations, so this marvellous skill in falling without injury is only a high development of that instinct of self-preservation which makes us all put out our hands when we trip headlong, or throw them up mechanically to ward off a threatened blow. You may stand upon a chair and take a little acrobatic up in your arms, and pitch him down on the floor in any position you please, without warning, and he will always, with no apparent effort, contrive that the brunt of the collision shall be borne by his hands or feet.

It is alleged that great celerity and dexterity are systematically cultivated towards the children by their trainers, and that the case of the Arab Ben Muhammad is no exceptional one. To get definite evidence on a point like this is obviously difficult matter. No doubt there are bad as well as good masters, and, it must be remembered, bad as well as good pupils. No doubt the boys are often virtually sold for money by their natural guardians, and they may sometimes be punished over their heads, with or without cause. But, looking at the source from which they are usually derived, and the absence of any influence of moral obligation which the bringing up of a street-urchin signifies, it seems certain that if they were not well treated and did not like the business, they would simply run away again.

As to what may be called severity of professional discipline—bodily pain inflicted in the course of training—I cannot believe that one can obtain on a rule. All those gymnasts and acrobats whose opinions concerning Ben Muhammad were asked, nearly said that he could not have understood his business, to attempt to force the unprepared bodies of his apprentices into attitudes assumed by himself, and, speaking from a surgical point of view, I must say that I am disposed to fully agree with them. If you overstrain a tendon or sprain a joint, what is the consequence? Swelling, inflammation, loss of power, and acute tenderness. Suppose, instead of giving the put the packet and prolonged rest which it will probably require for its complete recovery, you renew the action which caused the injury, most likely you will set up mischief which will impair the utility of the member for life, and possibly endanger life itself, for joints are bits of vital apparatus not to be trifled with. Under the most favourable circumstances, the strength and flexibility of the part will certainly not be increased, even after all pain and symptoms of injury have passed away. What, then, can be the rationale of endeavouring to establish such a condition by these means? Two or three years ago, a celebrated ballet dancer ruptured a tiny muscular fibre in the region of the ankle while performing some complicated step or poussette; inflammation ensued; she was obliged to forego her engagement, and extricate from the surgeons in

attendance on her were posted in the theatre, for the satisfaction of the public. The ankle joint became permanently stiffened, and she will never be able to dance again. No child or adult whom I examined showed any trace whatever of injury, nor could I discover any disease incidental to their mode of life. If an accident ever occurred to a child in the process of training, I was not likely to be informed of it, but I am bound to believe that serious accidents are extremely rare, from the precautions taken and the judicious administration of instruction.

An acrobat is one who unites the muscularity of a powerful man with the suppleness of a lady. When we see how lightly they jump over such others' shoulders, we are apt to forget that the same amount of force is required to propel their bodies to that height as would be necessary to enable anybody else of similar weight to take such a leap, and that in the seeming ease and lightness lies the whole art of the thing. No greater error can be imagined than that of the notion which assumes a professional tumbler to be a nervous, business individual, bristling in any direction by reason of his very substance. Without exceptional strength, the acrobat or gymnast is nothing. I can say without hesitation that all those who have come under my observation are men or boys physically fitted, according to their age, for any occupation under the sun. The flexibility is inherited rather than acquired. Look how a child rolls and tucks about with its limbs bent under it in all sorts of positions, any approach to which would fracture and dislocate our grown-up bones. Its ligaments are more elastic, and the capsules of its joints more extensible, than ours, and it is thus in an ideal condition with the acrobat to maintain by constant usage. It, like the poet, is born, not made, but there is this great difference—that while the advent of a poet is the most infrequent of miraculous affairs, we are all born acrobats. If you, mine and commoner recall, and I had only then the trouble to perceive the plasticity with which we were endowed years ago, we might now 'come out' in a great Aerial Act as the 'sprunged spirits of Spattercoast'. In fact, as my 'billy' friend pointed out to me, we know of no know, even at this day, what we can do in that way until we try, or are forced to do without trying, and many a man has found himself stuck under 'down, the spind' on the ice or skidding risk that he would have believed possible.

To return to our youthful athlete, whom we left still in his apprenticeship to the art. At the time he reaches the age of twelve or thirteen, the trainer often deems it advisable to give him a salary, though his time of years as an apprentice may not have expired. Naturally, the master contrives, if possible, to teach him only such business as can be performed with his sole occupation, but a well-practised boy of twelve or fourteen, especially if he be small and strong, would be very useful to a performer or troupe in any branch of the profession, so that his master finds it policy to make sure of his services by the payment of wages in addition to his maintenance—perhaps a pound a week, or even more in some cases. When the time is ripe, a regular legal compact of engagement may be entered into—

either for the duration of a tour, or for a certain number of years, or a contract of partnership, or the performer may start on his own account, and procure two and so falls back on his reserve stock of 'man', who, to the public, never grow any older. Although most likely accustomed to exhibit in one line of performance only, the boy will by this time have learnt many other feats for himself, though being constantly brought into contact with other specialists and having opportunities of using their apparatus on his friends, in other words, therefore, he may adopt an entirely different branch from that in which he was educated, according to the demands of the market. Once thoroughly grounded in the alphabet of his business—the forward lean, swing, backward lean, swing, and hand-off of the gymnast, and the lion's leap, flip-flop, spring, somersault, foot, back, and hand-spring of the acrobat—he is like one well established in the trade, and may take up anything with a prospect of success.

Very few quit this mode of life until compelled to do so by age, and it is impossible to lay down any limit for this. Until quite recently, three famous performers, representing three generations—grandfather, father, and son—were in the midst of their career. The first was a Londoner, and was noted for the marvellous ability of three 'Phantom' stunts, sometimes involving the very use of both the acrobatic and gymnastic arts. My 'billy's' informant, who was a man of sixty-two, and although he declared that he had 'had nearly enough of it', he had just signed a contract of an engagement for himself and his two pupils for the winter season at St. Petersburg, and was in treaty with a circus proprietor about a trip to India and Australia afterwards.

This Ruseley performance is so called, I was never to understand, after one Richard of that ilk, 'old Dick Ruseley,' who first introduced it. It seems to be very popular just now, being of what is termed a drawing-room character, and since it involves no elaborate mechanism is suitable for private fêtes or entertainments. The dance of dances, as well as the dexterity and confidence of the children who take part in it, make it a more pleasing exhibition than many displays of fancy athletics. The adult performer has on his back, and clasping his legs in the air, some about his boys—generally two in number—on the neck of his feet. To him, obviously, an experienced boy of light weight and good muscle as of the growth we, but he has the advantage of being able to do a great deal with a perfect nerve, as even as the child loses its fear, and can trust him sufficiently to be like a log while it is upon and tumbled about, and made to turn somersaults and go through all manner of antics apparently by its own activity. The precision at which these people arrive is something wonderful.

There is a trio of 'brothers' who have been before the public in all parts of the world for some years, the eldest being a performer, as to speak, and the two little ones, of course, variable, these are extremely clever exponents of the Ruseley specialty, and have introduced some startling novelties into it. Their 'Column of Tube' illustrations, perhaps later than any other feat which can be quoted, the exactitude with which their

movements are timed and the amount of pressure necessary is adjusted with a degree. One of the boys stands upon the upturned feet of the man. A tub, or circular box, is then interposed, upon which he climbs, a second tub is then inverted beneath this, and a third beneath that, and so on, until the man balances a pile of twenty upon his feet, and the youngster on the topmost one almost touches the upper border of the procession. When the column is complete, and the boy has stood upon his head or hands, and turned himself inside out a few times in that elevated situation, at a given word he springs into the air, the man kicks away the pile of tubs, sending them over the street with a deafening crash and clatter, and the boy, tumbling over and over in his descent, alights standing on the feet which are ready to receive him, sole to sole! They use every device to prevent the feet from slipping, and to prevent—who we would marked with four large nails in each palm, that scarcely call attention to the form of a spurs—do for their hands.

The latter performers also display marvellous precision in arranging their act into a chorus with one another. One will come from his perch, fly up and over a tub, turn round and round upon it a given number of times, holding by the legs alone, perform the "bon-bon" and catch just in time to step under a pipe which has been jerked up by his fellow performer, who has been going through a similar series of movements on the opposite side, and finally arrive, by means of the impetus thus obtained, at a certain point in the act of his song at the same moment that the other, dropping from above, reaches it to be caught hand to hand. At no stage of this complex operation can either of the performers hurry or retard his progress, thus nothing is read in a manner entirely by the eye on its first act at which each shall start on his train of movements. Each practices these things, with the amount of rapidity, neither more nor less, to which he intends to adhere, so that he will hardly vary a second in the duration of time which they occupy in a thousand repetitions of them. This mechanical accuracy being attained, the co-ordination becomes simple enough.

After all, it is not more wonderful than many actions which we perform in daily life without any conscious pretence at all, such as stepping, or jumping across a narrow space with the exact impetus requisite to land us on the opposite side, and no more. What a calculation that would be to work out on paper—the weight to be lifted or propelled, the distance, the mechanical powers employed, and the modifications of their mode of action! So we toss a ball up to within a few inches of the ceiling, purposely avoiding it, and place our hand to receive it without hesitation, almost unconsciously, in a spot which is traversed by the line of its descent. The act and it may be remembered, too, that the finger has more latitude than at first sight appears to be the case. It does not keep his arm stiff and extended, and trust to the bar coming within the scope of his fingers to an inch. If he be closely watched during his progress through the air, his hands will be seen to be placed, palms forward, just in front of the shoulders, the elbows being flexed and pressed against the sides. He can thus raise or

lower the arm, extend them or return them in the best position, according to the relation which he perceives he will occupy towards the bar on reaching that point in his flight which will bring him nearest to it, and can therefore make sure of grasping the bar whether that point brings it against his waist or carries him a foot below it.

ONE FALSE, BOTH FAIR;

OR, A HARD KNOT

BY JOHN W. HARRISON

CHAPTER IV.—TWO LETTERS.

BRENTON at Sir Pagan's dilapidated town-house in Bruton Street was not a very cheerful moral. The tenant was not a domestic man. His custom was to eat his devilled kidney or his moral of broiled chicken hearts, if with a good appetite, and a few London men return, then to send a reply to such letters as imperiously needed one, and then to start for the business of the day—the tables to visit, the horses to change, the lobby the study, the game to play. Truly, some of us of bluest blood, and who know the inside of a counting-house only by heart, are men of business yet, and hardly care to make both ends meet somehow. And of such was Sir Pagan Curlew. His sister, who sat opposite to him, presented a marked contrast to him, pale, beautiful, and slender in the way, in her manner calm. She had all it was and was very sweet, and so indeed was he, and gentle without. Only two letters lay on the table, letters in metal envelopes, and both addressed to Sir Pagan, who seemed in no hurry to open them, but eyed them when, as he bent his worthy face over his plate, as the high crash of them had rebounded a wave of the Criminal Law division of the Supreme Court of Justice against his imperiousness.

"Will you mind your letters, Pagan?" asked the girl at breakfast, she perched from his her almost untended hair, and spoke lightly, but with a half-trimmed sigh, and a flush of rising pink in her pale cheek. "I think that may be something—something about—me!" she added plaintively, as her great blue eyes turned towards his brother's face.

"Oh, bother it, my dear—won't they keep!" was the brother's kind rejoinder, as he fidgeted uneasily in his chair. He was out of those men who have a genuine dislike to pen and ink, and who ought to have been born when a layman's hand was more familiar with the sword than with goose-quill or pen-holder, and shrank at the prerogative of the clerical. In very truth, though Sir Pagan's correspondence was a tolerable example, the conducting of it cost him far more pain than pleasure. There were many epistles that for weeks and months he never dared to open it all, so hateful to the persistence of a damning business. There were telegrams that he was open in secret hate, only to find that his shabby intelligence was worthless, his wrong "that a failure, and he himself a poorer man, because one thoroughbred horse had cost him an easy winner, and another had left him miserably in the rear of the flying squadron at Newmarket or elsewhere.

'No—Pagan, it is for me—for my sake,' filtered the sweet low voice. 'I am my sister's handwriting on one of the letters, and I cannot rest until— Ah, how I wish, I wish!—'

'Wish, what?' bluntly demanded Sir Pagan, setting down his knife and fork.

'Pale, sad, and lovely, but with a set and determined expression about the well-shaped mouth that almost contradicted the timid look from those blue eyes, his sister confronted him. 'There is nothing strange, Pagan dear,' she said, 'in my wishing that all should be again as in the dear old days, and that this horror had never arisen to divide us. It was all owing to that awful Frenchwoman—all her craft and daring effrontery alone— But you scarcely catch my meaning, Pagan, and besides, it is too late now—too late.' Upon your letters, though, I beg. If I finish not, why should you shrink, brother, from what they may contain? Yes, read, read! and tell me quickly what they say of me!'

Thus adjured, Sir Pagan, with an unpatented exclamation, half suppressed, tore open the letter nearest him—a letter in a clear, delicate feminine handwriting. He skimmed hurriedly its contents, drumming on the table with one muscular forefinger as he did so. Then, making a wry face, as a wilful child might do when called upon to allow some exceptionally narrow indictment, he opened the second and brows of the two documents, the penmanship of which, tall, cramped, and slightly tremulous, was unmistakably that of an clerical lady. He read a few lines, and a scowl darkened his brow, and a flush of angry red coloured the pale bloom of his swarthy cheek.

'Confound the old cat! Why should she say her claws on me? he muttered angrily. 'I, for one, like being hunted, even by, very truly mine, or unnoctely, as it is. My Lady Fultra Montgomery, is Cuckoo! Ah! I don't envy you when in your house, if she has got to take this stupid old piece of anatomy in one of the fixtures of it. I've seen her twice—three times, perhaps, and she assumes the privilege of her age and station to rub me like a green "cucumber," as the ancients call it, for misconduct. Seems to think it's my fault that there is a row in the family—Take the letters, my girl, they are more in your line than mine, and see what you can make of them.' And as the youngest spoke, he pushed over the two letters towards his sister and rose abruptly from his chair. On the battered old sideboard stood an open case, whence peeped forth sundry silver-stopped bottles. A cup or draught of cherry brandy, or of some kindred liqueur, has been from time immemorial regarded as an indispensable adjunct of a brooding black. Sir Pagan, a keen sportsman in his boyhood, never went hunting now, but he had preserved the practice of his father's without then reason for it, and on this occasion he tossed off a couple of glasses of the potent spirit duffly enough. Its immediate effect was to soften his heart, hardening, but not hard as yet, and to render him more sensitive for another grief. After all, she was his sister. She was weeping now, and had naturally broken down, from the forced composure of her former attitude, and her sister touched him

even more than they would him, for he was English to the backbone, and scenes and sentiment were painful to his undomestic nature.

'There, there, little one, don't fret,' he said, from the depths of his pure, stupid good-nature. 'Take my advice, and let bygones be bygones. Make it square with her—a word would do it—and, rely on it, she'll get you as well married as she was, before a year's out, and meanwhile, think what it is to have the run of two such places as Lockminster House and Castel Vaux, with such an income to pull upon! See how kindly your sister writes, after all the kick up! She asks you—begs you—to come to her, not in Wake, but at her big London house, next week, and—'

Sir Pagan was interrupted here. The girl whom he spoke had been listening, as with a dulled anger, thrusting back the golden hair from her temples, and looking at him with eyes that glittered slowly. Then she sprang to her feet, and the blue eyes flashed, as the broom had never seen the eyes of either sister flash, throughout all the years that he had known them. But it is wonderful how few, unexceptional natures, brought into contact by the bonds of kindred, can dwell side by side without much insight into one another. This was as it were a revelation of character such as sometimes comes to enlighten us respecting those of whose mental or moral culture we had formed our own humdrum and perhaps deceptive estimate.

'Never!' she cried out. 'I enter her house—I cross her threshold—no, no, Pagan! You think that I am weak and silly, and frightened and young, and shall be bribed or scared into giving this up! Never! I tell you, brother—never! It is a part of myself—it is myself! I shall die, or I shall win!'

Sir Pagan, in fact, had used perhaps stronger and more violent language, but his brain mounted liquor ere, which he laced with care, for the dependents of a country gentleman must cultivate their wits in a world for strong and costly stimulants, and the Bruton Street broom was not rich enough to have temptation in the way of his unmaking. Then he turned towards his guest, and with rough kindness, and 'Fight it out, my dear, you've two like an' choose. I'm werry sorry,' he added hurriedly, as he caught sight of the distressed young face, so beautiful, so delicate. 'But you're a home with me, remember, as long as there's a crust—I'm going out now, and I don't suppose you'll see much of me till dinner time. I'm not engaged, and shall be back by then. And, and—if you want anything—of course there's old Tucker.'

So he made his escape, and his sister was left alone. There before her lay the letters, and she read them carefully. One of them began thus:

MY DEAR BROTHER—You will know how delicate and well I feel, and how much my grief for the loss of my kind husband was renewed by my return to the home that once was his. I did not think any other sorrow could have touched me then, but a pain almost as bitter has come since my heart. As well as my dear husband, I have lost a darling sister. But only for a time, I hope, and that I will live, only for a time, I know, of course, that I can, poor, dear, misguided

Cora, has taken refuge with you, and I wait to beg you to persuade my wilful, dearly loved sister to give up the wild scheme which she has rashly adopted, at the instigation, as I firmly believe, of an intriguing Frenchwoman. I hope, dear brother, you will use your influence with her, and tell her to come back to me. We shall be in London next week, at Lombard Street House. Say that I pray her to come back, and live with me as before, and be, as she has always been, my loving sister as of old. Tell her she need fear no reproach from me, that thus she will pass away like the memory of an evil dream, and she and I be, as we always were, together. I leave this in your hands, dear brother.—Your loving sister,  
(LAMB LOMBARD STREET)

The other letter was to this effect:

DEAR SISTER PAGAN—A strong sense of duty alone induces me to pen the few lines to you. The outrage to the memory of my dear nephew, the late Murray, and I may say to the family of which he was the chief, is one which I should have preferred to have consumed to oblivion, if possible. But the family are, in my opinion, mistaken indulgence with which my niece the Marchioness persists in regarding her living sister, renders it incumbent on me also to urge upon you the propriety of committing the most unhappy young lady to the care of her wits. I am sure that you must yourself feel that this is necessary for the avoidance of any scandal which might, even indirectly, reflect upon the hon. or of my family, with which I am now bound by marriage, to become connected. Trusting that you will see the necessity of this, and that your authority may be used to cause the return of my sister to her duty, I remain, dear Sister Pagan, very truly yours,  
BARBARA MONTGOMERY

She who read these lines remained long, in a state of intellectual torpor, with her eyes resting on the letters that lay before her on the table, although her thoughts were far away. She was disturbed from this reverie at length by the entrance of the servant who came to remove the breakfast things, and then, snatching up the letters and refolding them, she went up stairs to the apartments that had been allotted to her. As soon as the door of her own room was shut behind her, she exclaimed, with checked hand and glittering eyes: "They do not know me! No, I will go through with it to the last!"

### REVERSED WAYS

THAT different manners and customs prevail in different parts of the world is, of course, known to us all. In some parts of the world, the lips are brought together in token of affection, in others, the tips of the noses. In some places, to uncover the head is the mark of respect, in others, to keep it covered. In some places, black clothes are worn as a sign of mourning, in others, white. In some places, the dead are buried horizontally, in others, they are, or have been buried upright. In fact, if we take any of the great events of life, such as death or marriage, we find the ceremonies connected with them differing most curiously in different lands. Buckle

laid down the theory that the whole course of life was almost wholly and absolutely determined by local food and climate.

Great is the power of local custom, but very great also is the power of what we may call the dominant fashion of dress and manners among the higher classes in a nation, and among the leading nations in the world. Thus we find Oriental peoples eagerly adopting Western habits. The European dress is being adopted by degrees in Japan. We find the same in India. The young Bengalee looks on patent leather boots, a tall hat, and frock coat, as marks of progress and civilised manners. He likes to dress like an Englishman.

To what extent the two powers, local soil and climate, will act and react on each other, it is difficult to say. It is better for the Bengalee, nevertheless, to wear stockings and well made boots, than to go barefoot, or wear the hard, ill made shoes of his forefathers. It is better for him to eat with knife and fork than with his fingers. But is it better for him to follow the English fashion in eating much meat and drinking much wine? Has it been for good or evil that the Sioux races who have peopled North America have copied with them the wine drinking habits that cling to the colder and drier climates when they came? Would the natives of India be the better for eating the same and drinking the beer of the English labourer? Would it be so for the English labourer to live on rice and lentils? Are imported manners and customs, modes of thought and action, better than once locally grown? That at the first is impossible to decide may be true as well as just, as a point too much contested. But there is a theme worthy of a couple of wide treatises, in which as cannot be given to it in our small space.

These reflections have been suggested by recalling, to mind the curious difference between the habits and dress of the people in India and those at our own. It is when you get to the East that you find not merely differences in these matters, but an utter change and complete reversal. There you find that the primitive, the old world manners and customs still prevail.

It would not be possible to give all the differences to be met with in a big city like Bombay with its heterogeneous population, we will therefore undertake the smaller task of carrying the reader up with us to our luncheon in a small station in Northern India, between Ganges and Jumna, and noting down the differences that strike us, not by elaborate search, but by simply looking around us as we sit on the open veranda. There is the Monaloe or Persian writer doing his work at one end of the veranda. He writes squatted on the floor, with the paper held in his left hand, and resting on his right knee. Here is the first of the direct reversals of our way of doing things; for it will be noticed that the characters run from right to left. Look at

the tailor, your own private tailor, who is sitting at the other end of the veranda sewing. You see that he uses his toes as well as his fingers, his feet are bare of course, looking out the cloth with his toes, while his fingers are engaged in the work of sewing.

Look at the people at work about this house that is just being built. They work in a manner quite different from that of our workmen. They do not dig with a spade like ours. They could not put the spade into the ground as does an English workman, for their feet are bare. Nor could they throw up the clod from the end of the spade, for their arms are not strong enough. They use a spade shaped something like a hoe, with the blade set at an angle to the handle, which is very short, and they dig with a stroke from above the head, the body well bent down, and bring up the clod, or mass of earth on the blade, by straightening the body again. You see that woman in chiefly employed in carrying up the bricks and mortar, and they carry every thing on the head. You see that cattle are used for all purposes of draught, to pull the carts and draw the plough. This you may see in part if I stop to. But this difference of the animal used has a most important bearing on agriculture in India. English farmers have been struck blind in their efforts to improve the wretched Indian plough by the enormous labour and odious reason that the cattle can only be driven by twisting their tails! Hence the tails must not be cut off each of the drivers' hands.

That light open cart, with its cart driver sitting on which the bull is, who has just been driven on me, is a cow, is a bull, wrapped up in his skin, is going rapidly down the road, and you see that the driver sits on a small square box fixed on to the pole, with his legs dangling down on each side, close behind the bull's head, and pressing his feet against them from behind.

When the driver called, you observed that he did not uncover his head, but put off his shoes before coming into the room. This is another of the reversals of things. To remove the covering, of the feet and not of the head is the mark of respect in the East. It is easy enough to see how the putting off the shoes on entering a house came to be a social observance very early in the East. The Orientals sit and recline on carpets placed on the floor or on a dais. This is the place of our couches and chairs. To a Mohammedan gentleman, the dais, covered with its carpet and with its pillows and bolsters, represents house and home. Here he passes the greater part of his time, here he does his work, and here he receives his friends. This dais is his drawing room, dining room, bedroom. To come on to the carpet with shoes on after walking in the mud and dusty ways of the East, would soon soil and dirty it. This is the main reason for the observance. But another doubtless is, that it would be very uncomfortable to squat down with your feet under you with hard shoes on, besides, it would soil your garments. It may be conjectured that one reason for not removing the head covering is, that most Eastern nations shave the

top of the head only, leaving the lower hair hanging down long. Thus the hair is kept or worn in a manner suitable only to the head being covered. To appear without the covering is like a bald man appearing without his wig. Even in his own home, when a native removes his turban, he puts on a small light skull cap. It would be a great mark of disrespect for one of your native servants to come before you without his turban and with only his skull cap on, and without his moustaches round his waist, it would be like a footman coming in without his coat. This difference of custom is no more trifling matter, but has been a grave political question in India.

The 'shoe question' is one that has led to trouble between what are called the more enlightened natives and the English for many years past. The former claimed that when they wore shoes after the English fashion, they should not be called upon to take them off on occasions of ceremonial visits or on public occasions. On the other hand, natives (in India) in colleges would not let students enter their rooms, judges (English) would not let native gentlemen enter their court houses, without their first taking their shoes off. This was not from any personal arrogance, but from regard to their official dignity. To enter a place with shoes on is a strong mark of disrespect in the East, and they did not wish to submit to this. They claimed that one mark of respect to the other should be adhered to—that the one should either take off their shoes or uncover the head. Lord Lawrence, when viceroy, had to issue a state injunction on the subject.

It is strange to see the old Eastern custom still surviving among the Jews. The English Jew, who in all these places has accepted the English views and practices in the matter, keeps his modern tall hat on in the synagogue.

Looking round at the domestic arrangements in the bungalow, you see how many things are the reverse of what they are 'at home.' There is a 'washerman' instead of a washerwoman. The cook is invariably a man. The great object in a house in England is to prevent draughts, Anglo-Indians strive to promote draughts. You see we have doors and windows in every wall of every room, in most rooms four, and in some six doors. You see that as a rule everything is on one floor, there are no stairs, no cellars, no kitchen, the cooking room is away from the house.

Let us now stroll into this small neighbouring 'bazaar.' Here is a complete diametric difference from any street in any town or village in Europe. There is no point of resemblance. However much eating houses may differ in England and France and Spain, they in the main resemble one another. The food is the same in kind, though not in form, there are chairs and tables, knives and forks, spoons and cups and glasses, in them all. In this eating house in the bazaar before which we stop there are none of these things, the food is entirely different. French bread, and Vienna bread, and English tea, all differ, but they are all made with heaven, here you have nothing but unleavened cakes. The food is utterly different in character.

You see the animals in the various little shops

all work in a manner different from English workmen. They never work standing or sit in a bench, but always squatted on the ground. No Englishman, except a circus clown perhaps, will sit as those men do with their legs doubled under them. Here is the shop of an iron-merchant, his shop and office. How different from an English one. No chairs, no desks, simply a single open room with the floor covered with druggot, on which he sits up to his knees of coarse paper, and a piece of cloth for his feet and inkpot full of red ink. What a wild the English clerk think of books kept without a single ruled line in them! There is not a pencil or a ruler in the place. And yet this man carries on a large business, has transactions over thousands of miles. There he sits cross-legged in one corner, and a heap of customers, their feet clanked and clanked down—there legs invisible—bending over the books.

Look round, and you see that books, books of wood and glass, and bags of goods, are all ranged on the wall. We look into a school-master and pupils are all seated on the floor. The copy books are bits of board smeared over with a white unctuous earth. Here is a barber with his little stool, shaving the head of a customer, both squatted of course on the bare ground. The barber has a razor, but he uses only water, and has no soap. He brings the eyebrows of his customer to a fine point at each end, by shaving them; and then cuts his finger-nails and toe-nails for him—with the razor!

Here is a dunel from the country buying, or rather having made for her, trinkets at the silver-smith's shop. The silver-smith is squatted on the bare earthen floor, a pair of scissors, a pair of pincers, a pair of tongs, and a little hammer, and a small anvil, his whole apparatus. The young woman belongs to the peasant class, and is not obliged to hide her face in public, as would a native woman of the better class. She does not wrap herself up, almost herself in her long ample 'sheet,' but lets it hang from the back of her head. You see, therefore, that her hair is well plastered down with oil on each side, that the line of the parting is filled and marked out with a red pigment, that in the middle of her forehead she wears a small tin-plate ornament stuck on like a wider or patch, that she wears a big ring in her nose, that her ears have not merely the one hole through the lobe, as with us, but that there are two or three other holes in the cartilage above it, each having in it a ring or a stud. Her dress consists simply of a pith coat coming down to a little below the knees, the long skirt, and a small close-fitting, bodice without sleeves. The feet and ankles are bare. Round the ankles are the ornaments of brass, the colour of which suits the brown skin. On each toe and between the toes are also many brass and silver rings and other ornaments, some with bells, so that she makes a noise wherever she goes. She has 'rings on her fingers too, plenty of them, and those on the thumbs have little round mirrors fixed on to them. On her wrist and arm are many bright rings of a shiny wax and glass, and on the upper arm below the shoulder is bound an amulet, and the whole arm is tattooed. The pattern of the cloth on her skirt and petticoat is such as you have never seen in Europe. It

has been made of the same coarse texture, stamped with the same quaint patterns, and manufactured and sold within the same narrow radius of country, for thousands of years back.

Look at the dress of that group of men—next, decent, comfortable, picturesque, yet quite unlike our own. The piece of our trousers is taken by the dhoti, which consists simply of a long piece of linen bound round the waist and tucked in between the legs. It requires training to put it on, or rather fix it properly, and it forms a very neat, decent, practical garment. Above this is a small jacket or long coat bound round the waist with the common band or loin cloth, an essential and a different part of the dress, the loins are guided when going abroad, in a need in the freedom of domestic privacy. On the head is the pagari or turban, also a very significant part of the dress, for its shape, size, colour, and form vary with the race, occupation, and caste of the wearer. But in all the garments of that big crowd of men and women, you will not find a single hook or eye or button!

On our way back to the bungalow from the bazaar we pass by a village. Here, too, every thing is different from what it is in an English village. There is nothing here that you would find in the latter, not the slightest kind of table or chair, not the slightest kind of knife or fork, not the commonest kind of jug or cup or tumbler. The remainder is a wealthy man, and has a big house and many retainers. But in all the houses you will not find a single piece of what we call furniture, not a table, chair, bookcase, sofa, chest of drawers, or anything of that sort. There is not a single article of crockery or glass in it. There are plenty of vessels to eat and drink out of, but they are all of copper or brass. The form of these, as of the earthenware water jars and milk and pots, is utterly different from the forms our artists take. You see the man cut the corn not standing up, but sitting down, with a small sickle, and not with a scythe. The corn is trodden out by luddles at the threshing floor, and is winnowed by simply throwing it up in the air and letting the chaff blow away. The women carry their heavy water jars on their heads.

As we walk by the village, we note the difference between an English herd of cattle and that herd of thin, lean, ragged, dirty cows and bullocks. What a difference between that instrument called a plough and an English plough! There is the son of the remainder riding into the town. A very different sight that from the son of an English Squire riding out! How different the gear, how different the horse, how different the mode of riding! How different the heavy clumsy cloth saddle from the neat pig skin one! How different the head-gear! The horse is fattened up until he is in 'soft' condition. That he should have 'a belly on' is not held a defect here, but a beauty. His legs and tail are coloured, his mane plaited! Four white legs are considered good points. A white face and point nose are much prized. The horse's head is well tied down to his chest by means of a thick cloth martingale. He moves along at a slow, shuffling, half dancing amble, throwing the right leg well up into the air

with a sort of convulsive jerk, which he has been taught to do after long training. The young man sits back proud and happy. Behind him come two footmen, one bearing his bookish, the other his drinking water. A nurse never trots, and rarely gallops his horse, but generally goes along at an amble. How different is that small village hackery from an English village cart. There is not a nail in it, it is made chiefly of bamboo, and put together with leather thongs and string, the wheels do not revolve on the axle, but with it.

Look at the natives about us as we sit in the veranda, and the chief things that strike us, apart from the difference in their faces, the large and flat, the brown and black skin, the squatting on the ground, the waving with the fingers. Look out at the prospect, and we are likewise struck by the brownness of the land where uncovered with crops, the brownness of the patches of green grove, the brown stems of the trees, the clouds of dust raised by every puff of wind, the absence of colour in distant objects, and the bright clear, dazzling sunshine. We long for the sight of a bit of green grass and the shadow of a growing cloud. Here is the great revival. Instead of too little sun shine, we have too much.

## THE MAN IN POSSESSION

### IN FIVE CHAPTERS.—CHAPTER I

THERE are many ups and downs in mine life, far more than are usually dreamed of by the few who, 'born with a silver spoon in their mouth,' pursue the even tenor of their path, untroubled by the cares and afflictions which crowd upon, and too often overwhelm the less fortunate. Had as it is to grapple with and bear the troubles which are inevitable to us in the ordinary course of nature, those we induce by our own indiscretion and folly are still more galling. I am afraid my case must rank among the latter, as you shall presently hear.

I will not indite upon you my antecedents, sufficient to state that I am the son of a gentleman in good, though not opulent circumstances. My father gave me an excellent education, and afterwards a fair start in life by attaching me to a neighbouring solicitor. I might have done well, for I liked the profession, and was an apt pupil, but, unfortunately—as is the case with too many intellectual young men—I fell into evil company. It is unnecessary to enumerate the steps, from bad to worse, which gradually led to my undoing; essentially, I was far disgraced myself by my indiscretions were cancelled. Ashamed to meet my father, I went out into the world on my own, with scarcely a shilling in my pocket. Finding other employment, I was at last compelled—though bitterly repugnant to my feelings—to accept the humble occupation of a common hailer, and here my narrative begins.

Merely, and my chief to me one bright May morning, when I waited upon him for instructions, 'I wish you to run down to Britleigh in the motor of Watley and take possession in the usual manner. You will be more than ordinarily careful, as we have to do with a very sensitive customer. Jones has

already been down in the neighbourhood, but has returned unsuccessful and quite disheartened. I hope, however, you will have better luck. When once within the premises, you had better sleep with one eye open, or not at all, if you can so manage it.'

Now, I rather pealed myself upon my professional dignity, and this my employer knew, but it would have been childish to hint before him. I therefore smiled, but said nothing. Some other directions followed, of no importance to my tale, and after picking a few necessaries in a cupboard, I started for Britleigh. It was the dusk of evening, when I arrived at my destination, and I forthwith proceeded to reconnoitre the premises in which I was for a time to dwell as the humble representative of the 'majesty of the law,' and take under my surveillance the goods, chattels, &c., of Arthur Wintock, Esq., until either the just claims of Watley Works, Esq. of Watley Hall should be fully and duly satisfied, or, either with all legal expenses incurred, or the said goods, chattels, &c., should be publicly brought to the hammer.

On my arrival at the village of Britleigh, I went at once to have a sight of the house intended to be Britleigh Hall was a large, gloomy, old-fashioned building of the preceding century, and stood at some distance from the high road, and in the centre of a park of considerable extent. The original edifice seemed to have been added to at different periods, for the superstructure rose in a most irregular and irregular manner from the entrance to the principal roof, which, surrounded by a parapet, and crowned with enormous stacks of tall chimney pots, capped the whole. It struck me at the first glance, that however strongly bolted and barred below it would be easy for any burglar to scale the height and effect an entrance by one of the numerous quiet recesses which fringed the parapet, unless the same were strongly secured. However, as I had no thought of entering the house by this way myself, and as it was too late to hope to visit an entrance at all that evening, I returned to the village, and walked into the *Three Nags*, a comfortable roadside inn, about a hundred yards from the park-gate. I entered the snug bar parlour and seated myself. It was occupied only by the landlord and two other persons, a tradesman of the village. The three were quietly sipping their phizzes and having a friendly chat.

'Fine evening, sir,' said mine host, as, noticing that I was a stranger, he greeted me respectfully. 'What will you please to take?'

'Oh, a little rum and a star, if you please—can I have a bed here to night, landlord?'

'By all means, sir—second floor but—Gung to stay long?'

'Hum! That depends upon circumstances. At present, I may require it for three or four nights, at least.'

I felt disposed to secure a night lodging for a short time, for in our line we usually means when or how we shall be able to obtain access to the premises of which we are to take a temporary 'possession.' Besides, my own expenses would be reduced, as five extra shillings were therefore of no consequence.

My entrance and the bustle of the landlord

had interrupted the talk for a while, but after a few commonplace remarks, such as usually pass between strangers, I settled down quietly to my rum and water, and the conversation was resumed.

'They say he used her most cruelly, poor young lady,' said the stouter of the tradesmen, who sat nearest the fireplace, and who appeared to be indignant about some point which had been mooted.

'Cruelly! I should think he did,' replied the other. 'Ah! it was a sad affair for her when her poor papa died. How he could leave her in the guardianship of such an old curmudgeon beats my understanding.'

'Well,' replied the other, 'he didn't show the black father so much whim the old man was alive, and they say he was greatly disappointed that his brother did not leave him a good share of the property. He appears to bequeathed nearly all to Mrs. Maria, his only daughter, allowing, however, a handsome sum per annum to her guardian, to meet the expenses of bringing her up. It is said that the latter tried to force her into a marriage with her cousin, his son George, as unprincipled as himself, and as reckless and dissipated as ever handled the coin.'

'Ah! well, I suppose that was before I came into the village then, neighbour. You know I only left the north last Christmas twelvemonth.—But where is the young lady now?'

'That's a question neither I nor any one else in Bittleigh can satisfactorily answer. All we know is, that she was at the Hall. The butler came out about a twelvemonth ago, and said that she had gone to Paris to complete her education, but no one saw her go, or has ever seen her since. There are never any letters in a family hand received at the Hall, either from France or elsewhere—it least so asserts the numerous the grocer, who keeps the post office.'

'But the servants—do they never speak of her? Surely they must know.'

'He keeps none that are allowed to enter the house, except a big bully of an Italian fellow, whom he brought from abroad—for he was formerly a resident in Italy, and had only returned to England a year or two before his brother's decease—and a cross, grained old woman, who is as unprincipled as an assassin, for no one can ever get anything out of her. Neither the gardener, nor the man who looks after the premises and looks after the house, is allowed to intrude. A great part of the house is shut up as closely as if the whole were uninhabited. However, it is supposed to be full of real good furniture, for old Mr. Wintock lived in great style, and none has ever been known to be disposed of.'

Hitherto, I had taken but little interest in the conversation, for I was busily employed in ruminating upon my plans for the morrow. Though they had spoken of the Hall, it had not fixed my attention. But when the name of Wintock was mentioned, it roused me at once, and I immediately asked, 'Are you speaking of Mr. Wintock—up the way?' pointing with my thumb in the direction of his mansion.

'The very same, sir,' replied the stout man,

glad to have another interested auditor. 'Ah!' he continued, 'there's something exceedingly mysterious about the disappearance of that young lady. Some even go so far as to hint foul play. I, for one, don't quite believe that. But certain it is, you wouldn't catch one of the village people crossing the park after dark.'

'Indeed! Why not?'

'Why, sir, you see I don't like any kind of such superstitious nonsense myself, but it is always among the poorer folk that a white face is sometimes seen at the windows at unearthly hours, and that fearful shrieks have occasionally been heard at midnight. You know what a country village is, and how easily a place obtains the reputation of being haunted. Once upon a time, some of our fellows would steal up there after dark to catch a rabbit or two, for there is a Warren on the far side of the house, but I'd venture a five-pound note that not one of them would be lucky enough to lay now for all the rabbits in the county. There are reports, too, that old Wintock, or he and his son together, have outwitted the constable.'

'Oh! Is it true, thank you?'

'I believe it to be so. They do say that the life Mr. Georg and his father lead has involved both very deeply in habits which neither can meet. Drinking, horse-racing, gambling, and, if people are to be credited, swindling, so that he numbered among their accomplishments. The last I got was a clever, though a usually one.'

'Hum! What might that be?'

'Well, it seems that old Wintock had run matters so close that he was daily threatened by the creditors, and he was in a great deal of trouble. He owed largely, he borrowed himself that it was once sufficient to take effect, the rest of his creditors would be after him immediately. To give matters a look to a Mr. Wally of Wally Hall, in Devonshire, of whom he had some knowledge, he put out that he was staying in his neighbourhood for a short time, and that, in consequence of expense which young Wintock had incurred at college, he had occasion for a few hundred, and so in that the old gentleman to a friend had the money on a bill of three months at 5 per cent interest. When the time expired, the bill was dishonoured—not a rap to meet it, at least at the bank.'

'Then young Wintock was not a college?'

'Not he. It was all a sham, and then of present difficulties. But I suppose old Wally is down upon them at last rather sharp.'

All this I knew before, but was not aware that it was also known at Bittleigh. The old proverb says, 'All news travels swift.' It is not surprising how rapidly the misfortunes or crimes of even the most wary get round about, in spite of the most strenuous efforts to keep them concealed. I did not, however, enlighten my friend as to my knowledge, though I could not help thinking that he partly guessed the import of my visit to the village. But I did not deem it expedient to satisfy his evident curiosity, lest in some way it might embarrass my movements. I accordingly took an early opportunity of changing the subject, and after spending a very comfortable evening in social chat, retired to rest.

I rose early next morning, and sauntered carelessly into the park, making a circuit, to examine

the house more thoroughly possible, it appeared more somber and uninviting by daylight than on the previous evening. But that I attached much importance to the tale of my informant about its being haunted, but its heavy closed windows and its general dilapidated look gave it altogether a chilling appearance, which jangled dismally with the fresh spring masonry around it. Outrigger near the house and made a careful reconnaissance. Apparently, no one was stirring. The front door I found was fastened. I went quickly round to the yard at the back and tried the latch of the kitchen door. It was fastened also.

'Hello, guv'nor, what do 'ee want?'

I fairly started, and looked up, for I had thought myself unperceived. I could for the moment see no one.

'Wants to rob the house, do 'ee?' the voice continued. 'Wait till I call the master to 'ee. Thuvv, thuvv!'

At the same moment the barking of a large dog broke forth within the house. I grasped my heavy walking stick more tightly, it had a lonely lurch. I did not feel altogether comfortable. The voice was that of the gardener. He came into the yard through a small gateway which I had not observed, and which led into the garden. He held a long sharp three-pronged fork in his hand. I saw at a glance that he was the first who deflected supposing the matter to be ignorant of my arrival, my plan had been to cover quickly by the door until ordered for entry, which I had calculated would be only in the morning, by one of the domestics—either for water, as there was a pump in the yard, or for some other purpose—and then slip in with a click. On this I did not depend of holding my ground, but I had on me a couple of very pretty 'pistols,' in case of attempted violence—a pair of pocket pistols.

'There!' I said quietly, 'it's that confounded noise. You know better than that. Is Mr Wintock in?'

The man grinned. 'Can't hardly say. Dunno when he's in.'"

'The elder Master Wintock. I want to see him on particular business.'

'No 'ee?'

'Here, come this way a minute,' I whispered, at the same time holding up a sovereign between my finger and thumb and stepping under cover of the eaves of an outhouse. 'Now, don't you think you can get me speech with Mr Wintock this morning for this little bit of yellow stuff? You don't pick up sovereigns every day, I dare say.'

I had hastily determined to secure the fellow as an ally if possible, and felt that a bribe was the only means of doing so.

He scratched his head, grinned, and looked wistfully at the coin. 'O' darsen to say I could—out of doors!' and he stuck his head out for it.

'Not so fast, my man. You must earn it first. It must be inside. You are not such a flat bet that you can get my business here. Let me only put one within the doorway, and it is yours.'

The gardener gave me a peculiar look, and burst into a loud laugh as he turned away. 'No use, meester! T'other chap tried that little game.'

I was very weary and frustrated, and that there was no help for it. Nevertheless, I hung about the premises for some time, but to no purpose. I went away for a while, and returned again as stealthily as I could. I watched the house for days, and from every available corner that I could see as a hiding place. The inmates were too much upon their guard. It appeared there was a pump in the scullery as well as in the yard, and plenty of coal in the cellar. The place seemed well suited for a siege. Not a soul ever passed or repassed the door, at least with my companions. What orders were issued, were given to Hodges in an upper window, inaccessible by me. But I determined to give up watching, and try if I could not accomplish my purpose in some other way. I withdrew, folded, but not defeated.

Thus matters remained for some time, until I began to think I should fare no better than my predecessors, and to grow impatient, when a lucky accident turned up, which aided me not a little.

One afternoon, dressed with my all manner, I had taken a walk round the park, and had nearly reached the side entrance from the Hall, when I was startled by hearing sounds of altercation and loud screams for help. I did not hesitate an instant, but in two minutes had reached the park palings and leaped into the lonely by-road which bounded them on that side. It was well that I did so, for I was just in time to render effectual aid to an elderly female vainly attempting to hold her own against two villainous-looking ruffians. The old dame was a cutter for a little high to a milk-white, it was, whether she went three times a week with her cart and blind pony, to fetch and carry for the village, postmaster and parson, all descriptions, from a lady's dress to half a pound of tea. The ruffians attempted to help them over to some of the numerous provisions in the vehicle, and being resisted by her, were put on the point of using violence when I rushed unexpectedly to the rescue, and caused the fellows to retreat at once.

The dame was profuse in her thanks for my timely assistance, and insisted in her way to make me some recompense. The poor old creature had been terribly alarmed, and shook like an aspen. Answering her to inspect her things, and in trying to reassure her, I very naturally inquired what she was going.

'Da! 'ee! I be 'goin' on to the Hall.'

The mention of the Hall attracted my attention, and an idea immediately occurred to me. This time, however, I determined to experimentative, without taking my ally into my confidence.

'Going to the Hall, mother, are you?' I said carefully. 'Ah! I suppose you take parcels there very often, of course?'

'Why, yes, I do, and I don't now. I go every fortnight for the linen. The family don't wash at home, they send it all to Miss Bagg at the village. Their clothes basket you see there,' she added, nodding to them, 'are for the Wintocks; I'm 'goin' to leave 'em as I go along.'

'Well, dame,' I said, 'I am only out for a stroll. Perhaps those scamps may be lurking about somewhere, to give you another turn as soon as I am fairly out of sight. Suppose I ride a little way with you for protection. What say you?'

The dame willingly assented; and I mounted

the cart beside her. It was pretty closely packed with sundry parcels, besides the baskets in question, and well secured behind with a coviliet, tied down to the hinder part of the cart. The blind pony started at a shambling trot. Mrs. Stokes and I got into conversation.

'How do you contrive to get these great baskets out of the cart and into the house?'

'Oh, that's easily done. I undo the cloth behind; and Martha—that's the old woman at the Hall—or else the Italian servant, helps me in with 'em.'

And so we jogged on, chatting round the exterior of the park, until within a few dozen yards of its gate.

'Damn!' I said suddenly, 'I did you a good turn a little while back, now I want you to do one for me in return.'

Mrs. Stokes was taken at a deathly sight, and looked at me with a perplexed expression upon her countenance. She clearly did not know what to make of my observation.

'I see that your cart is well filled behind,' I continued, 'so as to screen any one in front from observation, while you are unloading the baskets, if he crouches in this spare place by the end. Now, I have a fancy just to ride up close to the Hall, so as to get a peep at it unperceived, and which I can easily do through this small hole in the side of the cart. I have heard a great deal of talk about the oil place during the short time I have been in this part of the country, and feel a little curious—but for a certain reason of my own, I don't wish to be seen by the inmates.'

'Mercy me! man!' ejaculated the old lady, with a pull at the reins which brought the blind pony to a sudden stand, almost flinging him upon his haunches, 'what can you want with a thing as that for? I hope you mean no harm. Surely your face is too honest for that.'

'Bugler,' said I, finishing the sentence for her. 'Now, that's very complimentary indeed, after the guidance I give you just now. I never heard of a thief interfering to prevent a robbery.' I spoke as if offended, and could see the poor old creature's feelings were hurt.

'Na, na!' I didn't mean that. But it seems such an odd thing like.'

'Jum!' I suppose they pry you pretty regularly up there!'

'Humph! Wish I could pry they did. Owe me a nether of a dozen shillings. Always behind. Promise to pay. Get a little by dribs and drabs. It's hard lines, though, for an old body like me.'

'Ah, now! let me do as I sit, and here's a sovereign for you, that will clear the debt and leave you a little balance besides.'

The old lady looked at me hard in the face, and then at the coin. 'I understand,' she said, 'a friend of the family—wants to see without being seen, before making yourself known. Just come from abroad, perhaps, eh? No! young man, put up your money. One good turn deserves another. It shall never be said that old Sally Stokes was too greedy to return a favour without being paid for it, so you may just do as you please.'

'Thank ye, mother. I know you'd oblige me if ever I have the chance. I'll repay you with interest, but I shall insist upon your accepting this at least, at the same time clipping a crown

into her palm. 'Now, don't speak to me, or take any more notice of me than if I was a young sucking pig for the Squire's table.' So saying, I crouched down in the coviliet corner, and disposed a few of the parcels so as to effectually screen me from observation. In a few seconds more we had entered the park. Jog, jog, up the long avenue, through the wicket gate, and up to the back door. The dame alighted, rang the bell, and commenced unfastening the coviliet behind. An upper window was opened. 'Oh, it's only Mrs. Stokes with the horse,' said a female voice. 'What till I chum up the dog,' and the window was immediately closed again.

I began to feel nervous for the success of my plan. Soon the door was opened, and with a peering observation, the staid servant of Mr. Winton commenced receiving Mrs. Stokes with the first and largest basket of linen. I waited till I saw them enter the house and turn up a long passage, then, hastily alighting from the cart, I slipped in as fitly after them.

### SAVED BY OIL

FROM THE RISK OF THE LOSS OF A SOUTH OF ENGLAND SHIPPING COMPANY, we have received the following narrative of his experience of the use of oil in a tempestuous sea.

In April 1867, I sailed from Cardiff as chief mate of a barque called the *Glamorgan*, whose dimensions were—length, one hundred and forty-eight feet, breadth, 27½ feet, depth, 17½ feet, and register tonnage, 157 tons, built of greenheart, with iron beams, and clued in Lloyd's Al, fourteen years. As may be inferred from our port of departure, our cargo was coal, of which there were upwards of seven hundred tons on board. And I remember remarking as we left the docks, that our draught at the sternpost was equal to the depth of the hold, but the draught forward was some twenty inches less. But be that as it may, although I did not meet our first hour, I know that it was very small, and I felt sure that in heavy weather our ship would be a wet cow. Encountering a south-west gale as we left the docks, we had an opportunity of testing the capabilities of the crew, which consisted of two able-bodied seamen, two ordinary seamen, one cook and steward, three mates, a carpenter, the captain, and six apprentices, two or three of whom had made one voyage to sea, the others being quite inexperienced.

When we dismissed the tug off Lundy Island, we made sail, and before many hours passed, had to reef the topmasts, but our apprehensions would not go aloft, as they were allured to have the deck. Nevertheless, by dint of a little courage, and they were induced to stand to the foretopmast yard, and assist to the best of their ability in reefing the sail, and before we had got south of the roaring forches, they could all hand reef and steer in a very creditable manner. Unfortunately, our carpenter died before we reached Madaga, and as the ship was on her first voyage, there were lots of carpentering jobs to do, which devolved chiefly upon myself and the captain. So, while we were running through the trade-

winds, we had managed to get the ship pretty square, and run for heavy weather.

Running Cape in July—which is there the depth of winter—we edged away southward until the parallel of from thirty eight to thirty nine degrees south was reached, and upon which parallel it was determined that we would run down the evening. Then we began to encounter stormy weather. Well do I remember that a few nights after crossing the meridian of the Cape, we had a fresh north west wind, and were under topsails and courses when, about half past seven p.m., a heavy hail set spring up from the eastward, causing the ship to dive and plunge violently. We happened to be pumping the ship at the time when she took a heavy dive, and in the fore end of the fore-peak—where was a large built abut the furnace—landed away all the trusses and cross of the fore top rigging, the whole thrust on to his head, and caused my chest to turn a water-mill, and run on bottom up while the deck was flooded with water, the ship having heeled herself as far as the foremast. Here was the beginning of our troubles, for next day the wind broke to the westward, and rapidly increased to a gale, accompanied by a snow-storm. The wind then veered a little to the southward, when the weather became calm. We were now running before the land west wind, and thus, accompanied as they were by the ship's time was which they saved, the ship was a speed of something like twelve knots an hour. These magnificent waves are a splendid sight, rolling as they do with such steady majesty, changing from dark blue at the base to green, and then to a beautiful transparent green, as the crest, that curls over with an ever-moving rim, in doing into froth and foam, and topping the mountainous waves mountainous with snow. Yet great in aspect as these waves are, they approach a vessel when in a way which is sometimes far from pleasant, for they come on us with an angry look, usually increasing in velocity, and if they do not come on board, they back around with a disappointed look.

After muddling for several days before the gales and being puffed and quartered by many heavy seas, our vessel was becoming the wreck of the building, some of the boats had been stove in, the cabin and fore-castle were all washed out, while the deck boards themselves were as leaky as sieves. One afternoon, the captain and myself were employed caulking the top of the cabin house, when a heavy sea boarded the ship, washing us both off the house, and dashing us into the main rigging, when we grasped the shrouds, and were saved from going overboard. Had we been at work a few feet further aft at the time, we would have gone clear off the rigging and perished. Our caulking men and masts were swept overboard.

The gales continuing to blow day after day, our poor barge was suffering much, nearly all the bulwarks having been washed away, while the long boat, which was stowed in the chocks on the main hatch, and contained the primates, stowed bottom up inside, was split into two by the pressure being driven right through

her, and both lay a mass of wreck on the deck, only prevented from being washed away by the lashings and ropes which still held on. The spare spars were even washed away, dragging with them, out of the deck, the ring bolts to which they were lashed. The after or booby-hatch was covered with a network of lashings, so persistent did the sea seem in its endeavours to wash it away.

Our time was now employed in repairing damage, and no sooner was one thing mended than something else was washed aloft, or the crew was so repeatedly washed away from their work, that it had sometimes to be abandoned altogether. The captain began to regret that he had not lightened the ship, by having cargo overboard, when he had the opportunity. But it was now too late for no hatch could have been opened without swamping the ship.

During the night when the vessel was secured by the two deck-crews, of whom there was one in each watch, the captain and myself for eight days were taking our shift of four hours each watch, while the other two hands to man the vessel, and the rest rolled after us, as we passed with their ten men on ice, while others would break over the tide and dash on board, when we left we were aware of what was coming behind us, would be knocked down, would make the wheel, and on some occasions far forward from the wheel. The cabin would be filled, so that the water was almost continuously employed during the night in taking out the hatch and cabin.

It was one middle watch when it was the wheel, was taken by one of the able seamen, that the wind was blowing with unusual fury, accompanied by hard squalls and a tremendous sea, which broke in board with such frequency, knocking about and driving us to the wheel, that we began to wonder if it were possible for the vessel to survive till daylight. At about four a.m. a great breaker came rolling in its destructive and irresistible fury, over the fore-castle, followed almost immediately by another, which washed us away from the wheel, burst in the cabin doors, filled it, and also the ship's deck up to the level of the foremast. Our little vessel staggered and stumbled under the pressure, for she was now completely submerged. Had a third comb of ice followed the second, I think she would have certainly sunk. At this time she seemed to hesitate for a moment as to whether she would float or sink, and just as we were thinking she was going down, she seemed to shudder and shake herself, and began to rise and recover her way. She had been really a stranded dam, thus dislodged.

After securing the wheel, which was done almost immediately after the second ice broke on board, and in much less time than it has taken me to relate what happened, we found the vessel within two or three points of her course, and quickly got her straight again. When conversing with my companion, he informed me that he had served several years in schooners employed in carrying furs from the Western Islands to England, and that when running before a heavy gale and high sea, it was the custom to have two canvas bags filled with oil and hang one over each quarter, whence the oil dripped into the

sea, and diffusing itself over the surface, smoothed the waves. This statement I repeated to the captain, who without any hesitation gave his sanction to the experiment, and as soon as it was daylight, I sent this man to make two bags such as he had seen used on board the frigate schooner. When flattened out, these bags were of a triangular shape, with the apex cut off, and when filled with any liquid, assumed a conical form. In fact, they were none other than the sailors' duff bags. These bags might contain each about half a gallon of oil, but into each was poured only about a quart, for we had not much to spare, the regulas were securely tied, and then they were hung one over each quarter. The oil now began to drip slowly into the sea, and after a few minutes, the effect produced seemed the work of magic. Although the wind was still blowing a fierce gale, the sea seemed to be comparatively hushed, and, in the wake of the vessel, calm, far instead of the angry roar which we had been so accustomed to hear at our heels while steering the vessel, all was quiet, save occasionally a hoarse and more furious wave would lift a little of its submersed crest over the tailfin and quarters with a hiving and defiant noise. What we before a great combing sea, was now reduced to a low, mountainous swell, which rolled humbly up to us and passed us with a smooth and almost comberless crest. But on each side of our track, and where the oil had not diffused itself, the waves still broke and roared with unabated fury.

For many days we ran before these noble gales and seas, but not another ever came on board. At times the canvas bags became clogged with the oil, and then they were packed with a large roping needle, which was attached to one of them by a lanyard for that purpose. The quantity of oil used, so far as I remember, did not exceed half a gallon in the twenty-four hours. Compared with such a small quantity of oil, the effect of it upon the sea was almost incredible.

Relating the above facts to some friends in Nauru, among whom was an Irishman, the latter remarked that it was no wonder the sea was smoothed with the oil, since the latter was so slippery that the wind could not take hold of it. Now, I have since learned from your *Journal* that this really is the reason, though I was perhaps disposed to think at the time that the Irishman was only quizzing me.

### SPONGE CULTIVATION.

It not unfrequently happens that nature's most useful and consequently most valuable products are those which are 'lost as the light and air of heaven' to all. It is a pity that it is necessary we should all that these are the things also which are most frequently and wantonly abused. Cupidity, carelessness, waste, and a wanton disregard of the future, are the reasons often made for all the lavish bounty of nature. Need we wonder that minute relations, and that diminution, dearth, and ultimate extinction are the results of this ruthless disregard of her laws and operations. We might give many examples of this waste—a waste which in many cases would most certainly have ended in extinction of the product, had not the legislature interfered in time with its protective power. If such a recital,

however, is fitted to teach us a lesson, the lesson is certainly not complete with out a reference also to the reverse side of the picture, in which man's ingenuity and industry in assisting nature to increase her stores have redeemed to a great extent the darker side to which we have just referred. Here also we might take examples from every department of nature, and show what

not only increased and cheapened her commodities, but frequently laid the foundation of new industries.

Something approaching to what we have thus shortly noticed is apparently taking place in the sponge fishery industry, and we mention it at present to show what has recently been accomplished in artificially propagating this useful article. The sponges of commerce are almost entirely obtained from tropical or sub-tropical seas, the Mediterranean and Red Seas in the one hemisphere, and the Caribbean Islands, Bahama, Azores, and the southern and western coasts of Africa, in the other. In those regions sponges attain their greatest development both in form and size. It is in the last named localities that the experiments which we are about to mention were conducted, and which were undertaken from the fact that the sponge fisheries on all the surrounding coasts were being rapidly exhausted.

The natural process of reproduction in the sponge, as we may state, effected by gemination or budding off the extremities or buds in the first instance are minute globular particles of gelatinous mucus spreading forth from the interior of the trunk in small protuberances, the foot stalks of which gradually becoming narrower, they ultimately detach themselves from the parent body, and float about until they again sink down—often in distant localities—where they fix themselves, and form the foundation of new growths. It has, however, been long known that they might also be propagated by division, but not until the results of experiment lately conducted at Paukey, Florida, has it been practically demonstrated that their artificial cultivation might be commercially successful.

Towards the end of last year, a sponge of fine texture and in every respect perfect, in every way under by light, was exhibited, which had been grown from a 'planting' some months previously. The planting was conducted in the following manner. From a parent sponge, a series of transverse cuttings were made, through which a stick was inserted, and then stuck in the sand on the sponge bed near to the shore. All this part of the process was carefully conducted under water, so that the cuttings were never removed from their natural element. In a few weeks of exposure, equally successful, the cuttings were planted on a rocky bottom, secured by wires, and covered with several inches of mud. Apparently the first operation of nature after the planting is to heal over the fresh cut surfaces, and thus it takes between three and four months to accomplish, after which the growth of the sponge begins, and so rapidly does it grow, that

within other three months, a cutting of about the size of a peach will increase to four and even six inches in diameter. At this rate, a good marketable sponge can be produced within the year. This growth, we may add, contrasts very favourably with those reared naturally, as even under the most favourable circumstances a period of two years at least is required to remove the crop that has been laid bare by the sponge divers.

We have used the expression here, 'under favourable circumstances,' on purpose, as there are many factors to be considered in the cultivation of the sponge. Aristotle, for example, who was probably the first to subject the sponge to scientific investigation, remarked the differences in their texture, and tried to account for it by saying that 'in general, those which grow in deep and still waters are the softest, for the wind and waves harden sponges, as they do other things that grow, and check their growth.' Aristotle was right in his observation, all the softest and finest sponges being undoubtedly obtained at a depth of from eight to thirty fathoms, but he was probably wrong in deduction, for the beds and waves, as carrying that on which the sponges feed, are necessary for their speedy growth and perfection. In this respect, the experiments at Pine Key were unfortunate, as they had to be performed in shallow water, and in a position where the tides and waves had probably their maximum influence upon them. The disadvantage, however, is one which altogether kills in favour of the experiment, as, with winds and waves and tides favourable, the artificial propagation might be expected to be more rapidly developed.

Whether the artificial propagation can be conducted in deep waters from which the finer texture sponges are obtained, remains to be seen, but even admitting failure in this direction, much may be done to compensate for it in the care bestowed upon the cuttings, &c., from which the future sponges are to be reared. Every one knows what can be done by careful selection in the propagating of plants and flowers, and we have no reason whatever to doubt that, with experience, much will also be accomplished with sponges, and that both shape and quality may be developed to a considerable extent. We wish the enterprise every success, not only because there is a prospect of its opening up a new industry, but also because it will likely cheapen a household necessity, which of late has tended to increase greatly in price.

## A WONDERFUL INDEX

About thirty five years ago, Mr William F. Poole (now Dr Poole), the present librarian of the Chicago Public Library, took the trouble to prepare an index of the subjects contained in such reviews and periodicals as were accessible in the library of Yale College at that time. This manuscript index proved so useful to the students and readers at Yale, and was so constantly referred to, that, to prevent its being destroyed, it was printed at New York in 1813, as in *Index to Subjects Treated on the 1st to 10th and other Periodicals*. Another edition, containing about six times the matter, appeared in 1855, under the title of *Index to Periodical Literature*. Thus much being accomplished, the editor very

naturally thought his labours were completed in this department, although the succeeding twenty-five years brought repeated requests for a new and fuller edition. At length, in 1876, at the first meeting of the American Library Association, the proposition for a new edition took definite shape, and Dr Poole assumed the responsibilities of editor, being assisted in his work by Mr Fletcher, of Walkam Library, Hartford. The scheme was carried out with the further assistance of fifty co-operating librarians, only eight of which were British, the rest being American. The result was a handsome and wonderful volume of over fourteen hundred pages, as big as Webster's Dictionary, and entitled *An Index to Periodical Literature* (Boston: James H. Osgood & Co., 1882). To show its value, we may say in a word that it is an index to the contents of over two hundred periodicals printed in the English language, from 1808 to 1881 inclusive, and that it gives a key to the contents of over six thousand periodicals. Such, in brief, is the story of Poole's *Index to Periodical Literature*, a book which will hereafter be indispensable to every reference library, and save a world of trouble to editors and journalists in hunting up what has already been written upon specific subjects.

Such a work is a splendid testimony to the immense literary activity of the past eighty years, and affords a key to quite an encyclopedia of knowledge. The entries in the index are the titles of the articles in the various periodicals, volumes of magazines are numbered in their date and page, and the subject is indicated by the 'C' in the left margin. At the beginning, we find the years in which the respective volumes were issued. Fully profit would not be obtained if a reader did not appear, while a reader will be in London we know we are not in London, owing to a trial down in the arrangement for doing so. Put as a hint of the wealth of subjects involved, we may say that under 'Women' the references to articles are in closely printed pages, Bible has fifteen pages, and it is not an exaggeration to say that each of the other subjects has about the same space, while the list of articles under 'Biology' occupies almost five pages. We notice with satisfaction that *Chambers's Journal* is very well indexed by Dr Poole himself, from 1841 to 1881 inclusive.

The editor does not seem to have found many more paying branches of literary labour, for he says: 'For as who knows but a man who will, should never engage in this kind of work. Up to this time, all the pecuniary reward I have ever had for indexing during these many years can be represented by the American coin I own which will cover one's thumb nail, and yet I have been well paid.' We trust the return from the present edition will be more satisfactory.

A glance at Poole's Index makes plain the necessity for some measure of uniformity in the subject in the list of subjects, where we find a good article appearing in a British magazine, the entries in the index plainly show the same article transferred to the pages of one or more American magazines, without having, benefited the British author or publisher one whit. Dr P. is thrown out the subject as in the present face of an index books other than periodicals. Whether or not this should ever be

carried out, he has at least had all those engaged in the business of literature under an immense debt of gratitude, by what he has already accomplished.

#### RECESSION OF THE FALLS OF NIAGARA

An interesting bit of information comes to hand regarding the wearing away or recession of these Falls. It will be known to many that, in conformity with recognised geological law, the rocks over which Niagara pours its immense volume are gradually giving way to the pressure and force of the torrent—its being worn down, or broken away in large detached fragments, and thus to such a degree that the gradual recession of the cliff forming the fall is distinctly observable by those who periodically take measurements of it. A correspondent, writing to *Nature*, has supplied some information which goes to mark the interest of the subject. He calls attention to the rapidity with which the Canadian side of the fall is deepening its bow-shot. An immense ruin, he says, broke off near the middle of the curve in October 1874, many windows in the adjacent museum being broken by the concussion. Altogether, he finds that in ten years the fall has receded twenty feet and

Some interesting calculations might be lived on this observation. The gorge below the Falls through which the river passes extends for seven miles, and the whole of this gorge is believed by geologists to be due to the current action of which the Falls have originated. Sir Charles Lyell calculated that the rate of recession might be about one foot each year, the rate, however, is probably far from uniform. The upper beds of rock which form the cliff are a hard limestone, extending down into to about half the depth of the fall. Under this and extending to the foot of the fall are soft shaly layers belonging to the same formation, and these soft layers of shales and marls, constantly acted upon by the moraine and spray of the descending waters, are gradually hollowed out, leaving the thick shell of limestone overhanging. In course of time the edge of the cliff, thus deprived of support, gives way, and on each occasion when this happens, the Falls will be found to have receded so much from their former position. In this way the work of erosion has gone on from year to year, the result being that the river now falls over the rocks at a point seven miles higher up in its course than it must have done at one time. Taking Lyell's estimate of the rate of recession—one foot a year—we find that a period of nearly thirty-seven thousand years has been required for this cutting out of the gorge. And supposing further that the Falls shall continue to recede—to cut their way backward—in the same rate in the future, then the seventeen miles which lie between them and Lake Erie may be disposed of in other twenty thousand years. That event should happen in time—to us mortals—very distant future, the level of the lake would be lowered, so that its whole contents would flow down the Niagara river into Lake Ontario, but so large is the body of water which Lake Erie contains, that seven or eight years would, it is calculated, be required in this way to drain it.

#### FROM MY WINDOW

An ivy covered gateway and beyond  
A wilderness of woad,  
Shrub roses deep, and holly tall and proud,  
And no one heads.

The garden runs in silence deep its snow,  
Its pretty women,  
Till hollyhocks and sun flowers bloom and blow  
The banks between.

The eglantine extended climb and cling  
In fanciful wild ways,  
While passing, an iris presses flowers flung  
Through silent days.

An old stone dial at odds and tangled fane  
In solitude captures—  
A world of beauty as it in the shadow lingers  
Old times of olden days.

A distant pool I see where tall reeds grow,  
And water lilies under—  
As swans swim on the lake and lilies down  
Unseen the whole.

I hear the nightingale pour forth its song  
The lark on the hill  
Till dawn appears, when other songsters weave  
A rich tale in.

But never sound beyond the lands and trees  
These birds have in their own  
They sing the sweetest music in the trees,  
To wild and woe.

No footfall here in this lonely place,  
No ripple leaves the dew,  
No voice but mine no eager smiling face  
Comes ever near.

I gaze from my window high above  
The landscape so fair  
I do but only long that some I love  
Might be near there.

I go to it with child from school bright,  
And laughter loving eyes,  
I see them, or pluck the daisies white,  
In glad surprise.

While off in dream I see one Woman sweet,  
Through gleaming summer days,  
Glebe fresh as summer all the flowers to greet  
With love and praise.

I close my eyes yet feel her dainty feet  
The battlements down press—  
I almost hear the madding, dashing beat  
Against her dress.

And once, no thought, I saw my tender dear—  
So mournfully alone—  
Whisper soft pleadings in the dim of eve,  
To wait the dawn.

Ah, loving heart, I too would stay Time a hand  
The while we wait—and pray—  
But what is time when in God's better hand  
Love lives for aye.

## A GRAIN OF STARCH

BY AN ANALYST

THAT may not seem much as a grain of starch, and in point of bulk there is very little, but we shall endeavour to show that there is a good deal of interesting and valuable information to be derived from a careful study of the little granules.

We are all familiar with such commodities as flour, potatoes, Indian corn, sago, peas, and arrowroot, and are consequently to some extent acquainted with what starch is, for all these substances consist essentially of starch, along with water and some minor admixtures. If we take a slice of a potato, for instance, and rub it on a grater of any sort in a basin of cold water, the water will soon become turbid, and a drop of it examined with a microscope will be found to contain a number of minute oval granules, which would in time sink to the bottom of the basin, forming a white deposit. These are grains of starch, and so minute are some varieties, that three thousand of them laid end to end would barely make an inch.

The starch of every plant differs from its neighbours both in size and shape, and this has a considerable influence on the character of the vegetable organ in which it is stored up, the hardness of rice, for instance, being due to the fact that rice granules are extremely minute, with angular corners which fit closely and firmly to gether, whereas potato starch is large and round, with considerable interspaces filled with water, and so forms a comparatively soft mass. But, notwithstanding their outward points of difference, in chemical composition the starches are all identical, consisting of carbon, hydrogen, and oxygen—exactly the same materials as sugar is composed of, and better known as the component elements of coal and water. Leaving the many varieties of starch in the meanwhile, let us consider one species—namely, that of wheat, because it is the most important in this country, forming the basis of our daily bread.

An ordinary grain of wheat if sliced through the middle and examined as to its structure, will be found to consist of several layers, the outer a hard coating, which contains mineral salts, lime, sand, &c. Beneath this is a zone of matter very rich in gluten, the flesh-forming constituent of the wheat, while the central portion of the grain is occupied by a white powdery mass, which is nearly pure starch. In manufacturing flour, the two outer layers, which together form the bran, are usually removed, leaving the white starchy flour of the central portion.

Let us now briefly consider the chief points in the chemistry of bread making. If flour be worked up with water, it forms a sodden, unripe, indigestible mass, but if heated to the temperature of boiling water, the starch granules burst and it is thereby rendered a little more digestible, although still forming a close, stiff, and not very palatable cake. Such is the character of unleavened bread, and sea biscuits, a slightly different form of the same thing. To be fit for digestion, starch must be dissolved or softened by boiling or baking, hence the reason why raw nuts are so indigestible as compared with the favourite roasted chestnuts, and hence one reason for cooking food, which mankind has been taught by experience, ages before chemistry could give a scientific explanation of the reason why. Cooking is, in fact, a partial digestion, and the same is the case with baking, both being preliminary aids to the changes which take place in the mouth and stomach before the food is in a fit state for the preparation of the blood. Accordingly, we bake our bread, and we bake it in the way we do because a soft spongy loaf is more readily moistened and acted on by the saliva and the juices of the stomach.

There is a good deal in the chemistry of bread making, and our bread might be much improved if bakers had a more intelligent understanding of the science involved in their business, for although several improvements have been introduced of late years, the most of our bread

is still prepared in the old fashion. The necessary quantity of flour is put into a trough with about half its weight of water, and sufficient salt and yeast or leaven, then thoroughly mixed up into what is known as the 'sponge' (Hence we may remark that the best flour takes up the largest quantity of water, and a rough test of the quality of two samples of flour may be made by comparing the quantity of water required to obtain a dough of similar consistency). After the sponge is made, it is left for about five hours in a warm place to ferment, after which it is kneaded with the rest of the flour, and again left to rest some time. The dough is then weighed into lumps, which are put in tins, and set aside till they have risen to twice their previous bulk. It is to the yeast or leaven that the rising of bread is due and the action is identical with that of the fermentation of beer. The flour contains a small amount of a nutritious substance which changes a portion of the starch into sugar, the yeast then attacks the sugar, splitting it into alcohol and carbonic acid gas, the little bubbles of which try to escape from the mass of the dough, but are entangled by the gluten and gum which the flour contains, and thus every part of the bread becomes permeated with little cavities. Eventually the fermentation would cease, and the bubbles of gas would find their way to the outside, thus leaving the dough much less light and spongy than we wish it to be, but this is avoided thus by putting it at a temperature into a hot oven, the heat of which the proper increases the fermentation. In which it is, however, the temperature is a few minutes high to kill all the yeast (becomes sufficient) tion is thereby stop the germs, the fermentation, heating the starch, and by continued mass is increased, and by continued and the attained. On in the porous form it has then the bread. A little of the alcohol is retained in the bread, but practically almost the whole of it is lost, amounting to some three hundred thousand gallons per annum—is driven off by the heat. During the baking, the starch of the outer portions of the bread has been browned by the heat, and thereby changed into a matter known as dextrin or British gum, and perhaps this fact accounts for the foulness of some children and even grown up people for crusts.

Of late years a system for making what is called acidified bread has proved very successful, and is free from the slightest objection. The dough is made by mixing the flour with water saturated with carbonic acid gas, which on baking, is expelled from the water, and thus distends the dough, producing a light spongy bread, with no loss of starch or sugar, and without any injurious or objectionable ingredients having been introduced.

Having dealt with the baking of the bread, let us now briefly consider its further progress in being adapted for the wants of the body. As soon as a piece of bread is put into the mouth, an abundant flow of saliva takes place, and in fact it needs no actual tasting to induce this flow, for even the sight or smell of anything nice is quite sufficient to 'make the mouth water,' as we say. The saliva is poured into the mouth by three pairs of glands to the extent of some twenty ounces a day. It consists in great

part of water, with a little salt and a peculiar substance called ptyalin, which possesses the property of changing starch into sugar, the change being accomplished most completely when the starch is dissolved or baked, and at a temperature of about ninety-eight degrees Fahrenheit, the normal temperature of the body. Although this ptyalin is present in the saliva to the extent of only one part in five hundred, yet, on its presence and action, the heat, and consequently the life of the body is largely dependent, hence the importance of avoiding any unnecessary waste of it, such as frequently and unnecessarily accompanying smoking. Hence, likewise, we see the importance of chewing the food slowly and thoroughly, that it may be all brought under the influence of the ptyalin, and thus we can understand how indigestion or dyspepsia may be caused by hasty chewing or by excessive eating, the starchy portion of the food either goes lying in the stomach or is undissolved maw.

Based on what we have already stated is a form of cooking. The heat of the oven has converted the outside of the bread into sugar, and the starch on the inside has in fact been boiled in the steam of the water which the dough contained, so that it has become capable of being readily converted into sugar. The porous nature of the bread

ours this conversion, for the saliva easily penetrates through the whole of the spongy mass, and the change is still further assisted by the water which the bread contains to the extent of some forty per cent. The taste, on the other hand, being as a rule dry and a little spongy, is less suitable for ordinary use, although containing in the same weight far more food material than bread.

It may surprise some of our readers to be told that the starch of bread has not the slightest nutritive property. Its sole office is a heat-producer, and just like the coal of the engine, the starch or sugar is burnt up inside us to keep up the temperature of the machine. It is this, then, the starchy nutritious matter in the grain, which is the nutritive flesh-forming material, but in the present article we have no space to follow the changes which it undergoes in the system, for we are simply starting of starch at present, and we trust we have made it clear how it is changed into sugar, and thus made soluble and fit for absorption into the juices which keep the body at a uniform temperature and in good repair.

It is a common but mistaken notion that arrowroot and tapioca are very nutritious. On the contrary, they consist almost wholly of starch, with only about three per cent of gluten, so that, unless cooked with milk or eggs, they form a very insufficient food. The same is the case with Indian corn flour and arrowroot, which have scarcely a particle of nutritious matter in them, so that it is a great mistake to feed an invalid or a child on such materials. They are no doubt useful, as easily digested heat producers, but they must be cooked with milk or eggs before they are of much use for actual nutriment, and many a child has been starved to death through its parents' ignorance of this fact. It is true, medical men often recommend arrowroot for those in delicate health, as it is of great importance

to keep up the natural heat of the body with the hot excretion of the digestive organs, but it cannot be too widely known that arrowroot pure and simple is a more heat producer, and milk, beef tea, soup, or other suitable flesh forming food, must be given with it, if the child or invalid is to be kept alive. On the other hand, some linz, hominy, kental meal, pea flour, &c., not being prepared by washing, contain a small quantity amount of flesh forming material than arrowroot, &c.

The starches are largely used in several important manufactures. Dextrin or British gum is prepared by heating starch to a temperature of about four hundred degrees Fahrenheit, and is preferred to gum arabic because it is not so liable to crack or curl up the stumps or other paper prepared with it. Immense quantities of starch are used, too, in the manufacture of linens or grape sugar, which has exactly the same composition as starch, and is prepared by acting on the starch with sulphuric acid (oil of vitriol), which has the same effect as the ptyaline of the saliva. Linen runs are largely used for the same purpose too, and, indeed, it is wonderful how few things are altogether new at the present day. Oil boots and horses provide some of our most brilliant colours, while dye colours innumerable are made from the refuse of our gewgaws, and the washings of our factories are proving mines of wealth, instead of mounds of rubbish.

## ONE FALSE, BOTH FAIR,

OR, A HARD KNOX.

### CHAPTER I.—AT LEONMISTON HOUSE.

VERY many Londoners who boast their intimate knowledge of the ins and outs of London, and especially of that West End which is a glorified adjunct to the ancient city of King Lud, would be puzzled to identify the exact locality of Leonmiston House. And yet the grand old mansion, cooly hiding behind its massive walls in a gloomy street of Mayfair, is well worth seeing, when its wide gates open to give some carriage access, if only for the sake of its superb frontage, designed by Inigo Jones, and as yet unspoiled by climate or the restorer. Very long, stately, and majestic, like some other town residences of the higher aristocracy, was this great old house, which had been built among green fields, long ago swallowed by encroaching brick and mortar, and the once famous gardens of which are represented by the modern Mont gomery Street and Place and Leonmiston Street, which stand where once meads of honour in hoops and powder, paint and patches, flirted with courtesans in blue and silver, in pink and gold, with laced hats, richly lilted swords, and clouded canes. It would have needed, as in the old days of ostentatious housekeeping, an army of gorgeous footmen, and a herry of valets in the gay apparel of former times, to have enhanced the somnre stateliness of the enormous home, or the tomblike silence that seemed natural to it.

There had not been much of this within those walls for some years past. Lady Barbara could remember seldom hospitality in a princely scale, but somewhat pious and wishal, to have been extended there in her father's time. But her brother had hated the place, and indeed had spent his leisure and his revenues for the most part in Genoa, Como, Naples, while the late lord's short reign and sickly health had not been consistent with much enjoyment of Leonmiston.

In a large, sadly splendid room, one of a suite of sadly splendid rooms, that were reached by traversing an inner hall, paved with marble, and a ghostly corridor carpeted with red, reclined the newly arrived mistress. There was something touching in the contrast between the cold stateliness of the magnificent house and the helpless attitude and air of extreme youth and childlike innocence which distinguished her to whom all beneath that roof were bound to yield obedience. Dressed in the deepest mourning she was, but graceful even amidst the more slender but not less charming, black robes, the gloomy hue of which set off the purity and beauty of her almost dazzling complexion, and the sheen of her golden hair. The likeness to the absent master would have been very striking, had any one been there who had known the two in days when Clara and Cora were together and poor, but this one looked calmer and more pleased than the other in that street had been seen to look since first, under the lawyer's care, she sought the shelter of her brother's insolvent dwelling. Lily Barbara Mont, tall, rigid and upright in a tall backed chair, sat like a guardian dragon opposite to the mistress of the mansion. A stern expression was on her thin lips and in her austere eyes, and there was displeasure in the ring of her voice as she said, "If I admit, to my mind, of no consolation, Clara, my dear brother your brother nor your sister—acquire me—has behaved as I had a right to expect. Sir Pagan has positively not paid me the compliment of sending in answer to the letter I addressed to him."

"Perhaps," answered the other, "perhaps Sir Pagan did not know what to say."

"It is possible, when the subject of discourse turned on topics less congenial than a horn or a dog," returned Lady Barbara in a voice that quivered with suppressed anger—for the chastilane of Castel Vaux, though too old to entertain modern theories of women's rights, had very strong ideas of her own, as a born Montomery of the long titled branch of that most ancient clan—"that Sir Pagan Owen might find himself at a loss for a fitting method of expressing his sentiments. But he might have remembered that the commonest rules of courtesy demand that a gentleman should be at least polite to a lady."

Now, this was precisely—though Lady Barbara did not know it—what poor Sir Pagan did remember. The recollection of her letter cost the miserable young baronet many a twinge during those nighty manings that we all have, and wherein so many unaccountable facts are marshalled up against our past and scrutiny. "How can I answer that high bred old cat at Castel Vaux?" was a question that Sir Pagan often asked himself, as he shifted to and fro on

his uneasy pillow, and it was a query that took precedence frequently of pressing questions as to stakes and entries, halting upon race-horses, meeting 'that bill' at Mossa in Camber Street, and raising the sun, three hundred-part wine, part pictures, part cash—from Mr Aaron in Windmill Street, Haymarket. Sir Pagan was to the backbone a gentleman. But the broken-down Devonshire baronet had never been schooled in the ways of the feminine world. Men, he understood pretty well. But of women of fashion he knew strangely little, and of such majestic survivals of a former state of things as Lady Barbara, he stood in awe, not unmixed with repugnance. Several times he tried to pen a reply to her magniloquent epistle, but gave it up for the moment. And so it fell out that the task of answering Lady Barbara was instinctively and unwillingly relinquished.

'Poor Pagan!' he scarcely ever wrote a line in his life either to Cora or to me," said Lady Barbara's companion, very gently. "It is of her, not of him, that I am thinking, isn't so often, and so sadly."

"But your sister has likewise left you! It is unrepaid to," returned Lady Barbara, with a line of severity about her hard mouth.

"Poor Cora, poor misguided girl! Yes, she is headstrong in her error."

"You should say, Clara, obstinate in her sin," interrupted Lady Barbara impatiently.

"Not when I speak of Cora—not when my sister is concerned," answered the beautiful young mistress of the house, with a sweet firmness that became her well. "I can never be harsh, never unkind in word or thought, when it is of Cora that there is question. It is not as if she were really—oh! hearted, dear Aunt Barbara. She is a true, dispassionate, good-minded thing, and if I could only see her!"

At this moment a delicate interjection occurred, as a room of the chambers, silver in hand, entered with a note for the younger of the two ladies.

"At last!" exclaimed Lady Barbara, while the colour of the young lady went and came, as with trembling hand she took the letter. Neither of the two ladies doubted that the absent sister had at length sent the long expected reply. The groom of the chambers, who bore a close external resemblance to a dean, and swayed a un, on noiseless feet as he had come, and closed the door. Meanwhile the recipient had had time to scrutinize the note which she held between her fingers. Her heart gave one convulsive bound, and then ceased to beat—so it seemed—and she grew white to the very lips. She did not open the letter, however. "You seem in no hurry, Clara, my love," said Lady Barbara, in that admonitory tone which old people, in the days of her own youth, had been wont to adopt towards young people who were tardy or slack in fulfilling the requirements of their elders. Lady Barbara was anxious to know what the tenant could possibly have to say for herself. Could the letter be a renewal of the old audacious effort at imposition, or was it a mere confession and whispering plea for mercy and forgiveness?

"It is a mistake. It is not from Cora at all—nor from my brother. It has nothing to do with that sad affair," was the reply, in a voice that

was not quite so steady as its beautiful owner wished it to be.

"But then?"—interjected Lady Barbara, half interrogatively.

"I have said that it is nothing—a trifle," replied the other, almost peacefully, as she thrust the note, unopened, into the midst of a litter of tiny trivial objects that lay upon the table at her side. "It is a disappointment," she added, smiling slightly, "for I, like you, had hoped that Cora had written."

Lady Barbara's foot drummed on the velvet carpet, and her eyebrows expressed displeasure as eloquently as ever broad, black, well-arched eyebrows can have done since the world was a world. The noble spinster had cherished a certain half-formed design of 'being a mother to the youthful widow,' so strangely left father and such. Lady Barbara was not in the least consciously selfish in thus proposing to herself a quasi-maternal mentorship over so very well-endowed an orphan as the young Lady Leominster. It was not the latter's purse—her income over which she desired to establish a control. She had an income of her own that was large enough to leave an annual surplus. But she loved her level power, and her unexpressed wish was that the border-creek and the London mission in the revenue that went with them should be managed according to her, Lady Barbara's notions of what was right. She wished her nephew a wit to justify his chivalry, turning out a model Mr. Larches, and regulating her actions and choosing her friends according to right rule and sage opinion. But it is difficult to assume unmarked the character of guide to one with whom there has been no early familiarity, and sweet is the girl's temper unquestionably was, Lady Barbara had an instinctive feeling that she was not one of those weak members of the sex who are ready to yield sleep like obedience to the first word of domestic tyrant who chooses to demand it. Lady Barbara, then, restrained the impulse to inquire concerning the origin of the note just received.

"I was thinking of going out. There are one or two places I want to go to, and then I could take a turn in the Park before driving home again. The air would do you good, Clara, dear. Will you come with me?" said she as sweetly as she could.

"I should prefer to stay at home to-day. I am tired, and besides, I wish to write to Cora," answered the other gently.

Lady Barbara had been used to hear her suggestions treated as royal commands. She frowned and looked doubly austere as she rang the bell and ordered the carriage. Then she went to attire herself for her outing, and still her young companion sat motionless, almost in a crouching attitude, in her chair, her slender white hand resting heavily on the tray table beside her, whereon stood a vase that held a lily, and a heap of beauty journals, photographs, and so forth, as well as a small enamelled workbox, over the edge of which peeped bright skeins of floss silk and glittering beads, and the implements of some slight feminine industry. Close by this box the unopened note had been, as if carelessly, pushed, and there it lay. It was not till the carriage with Lady Barbara had fairly rolled out of the

countyard, that a strange change came over the countenance of the young lady, as she took up the hitherto neglected letter, and tearing it open, set herself to the task of perusing its contents.

## PAVEMENT PORTRAITS

A WRITER

NOT a poet, nor a writer of fiction or history, nor a scribbler on science and art, nor a builder of journalistic columns, was this tall, thin, young man, who, dressed in a well brushed, somewhat threadbare frock coat, thick, comfortable, and rather old fashioned high hat with a broad brim, was a little while ago to be met every morning at nine A.M., or thereabouts, near the end of Chesapeake. It was a government office assistant, or, to give him his official designation, a Civil Service writer, who was thus hurrying to his daily labour, a man who for temperance an hour drudged away his life.

About always, wrapped up, whatever the weather might be, this poor boy—for he was only four and twenty—always looked cold. And cold he invariably was. Born under an Indian sun, bred in a bungalow, and living, until within the last few years of his young life, in a climate where blankets would be intolerable but for punkahs and long spells of luxurious ease, the change to the dull grey shawl of a London suburb, and the sordid existence of a government writer, had developed in him the seeds of hereditary consumption so rapidly, that no one looking at him plodding to his daily labour could doubt that with him the time could not be long 'or ere the silver cord be loosed, & the golden bowl be broken.'

Notwithstanding his shabby clothes and chilled appearance, this 'portrait' looked by no means an unhappy member of the human family at the time when he was first to be met on his morning walk along Chesapeake, now nearly four years ago. He was new to London in those days, his father, an officer in the Indian army, having not long before been slain in a brush with some mainly natives, and his mother having returned to England and set up housekeeping on a very small annuity, with her son and daughter at Peckham. At that time, the wear and tear of London life going on around him unheeded and unaverted, and his daily tangles between Peckham and his office had not become the painful tests which they subsequently grew to be. The nature of this young man was bright and cheerful, he had an unquenching mind, he was young, and had the hopefulness belonging to nearly all youth. So the first spring, summer, and winter went by without any particularly disturbing element in the lives of the three Anglo-Indians at Peckham. But the second spring brought with it a severe illness to the young writer. For week after week he was laid up with a distressing cough, tightness of the chest, and general symptoms of the dread complaint, from which, as his mother knew only too well, he suffered, and when, towards the beginning of summer, the boy resumed his work at his office, those with whom he was brought in contact noticed how suddenly the complaint had gripped hold of him.

Still he plodded cheerfully on, working the full limit of the time during which he could work, in order to squeeze as many pence as possible from the cashier at the end of every week. He had a hopeful word for his mother whenever she questioned him about his health, concealing even from himself the doubts which would obtrude upon his thoughts as to his condition. And he bent all his energies to the one task of adding to the little common fund at home for the maintenance of his mother, his sister, and himself in independence.

But another shadow, besides the dark one of disease, began to cast itself over the little household at Peckham. Debt appeared. Debt, incurred first during the spring, the year of the writer's illness, seemed to grow heavier and greater week by week, drive as the family did to drive it from their door, and when July came, a catastrophe happened. The writer came down to breakfast one morning, and found his mother weeping bitterly over the dressing case of his dead father. There was the box which to him, as a child, had been a delightful mystery, with its secret jewel drawers, which only opened upon the pressure of some unknown spring, its silver topped bottles, its penknife, scissors, paper knife, razors, and all the useful articles of a rich man's toilet table. The young man stared at his mother, drying her eyes, silently put each of the contents of the case into its proper place, and then, having shut and locked the box, put it up reverently in paper, tying the string with an energy which, unnecessary in itself, showed the deep emotion which agitated her.

'Charles,' she said, 'the rent—Lady day, but it is not yet paid. The landlord will not wait for ever. It must be done. Take this, Charles, and get the money.'

The boy felt a horrid lump in his throat as he cried out, 'O mother! dear father's dressing case! I can't, I positively can't!'

'Charles,' and his mother very solemnly, 'don't think that I can bear to do this any more than you. But it must be done. We will try and be even more economical than we have hitherto been, and we will get it out soon again. Our debts must be paid. Surely it is better to raise money in this way, than to go on being the slave of one's creditors—and of that most important one of all, the landlord!'

So Charles took the parcel up, and on his way to the office that morning, he tremblingly entered a pawnbroker's shop in Blackman Street, Borough.

Oh, the fit of coughing which he had when he came out of that pawnbroker's! The pawnbroker stared in pity at the poor thin figure, almost bent double with pain, his weak frame looking likely to go to pieces with the violence of the cough. But he hurried on, his handkerchief pressed to his mouth, and none but he saw the scarlet stain thereon, when, the fit over, he was able to take it from his face and replace it in his pocket. That scarlet stain haunted him all day long all that day, and for weeks and weeks, the writer, filling up forms and docking papers, thought of little else—the blood on his handkerchief, and his father's dressing-case in the pawnshop.

He never told his mother of that fit of coughing.

in Blackman Street. The burden of poverty was the common lot of all at his home to bear. The skeleton in his own cupboard was kept fast locked up and out of the sight of the others. But it was a cruel secret to keep, and the mental trouble it caused him by no means contributed to strengthening his weak constitution. However, the writer, if he had a feeble body, had a strong will, and all the energy of his nature was directed to the one specific purpose of releasing his father's dressing case from what he considered to be the degradation and disgrace of the pawnbroker's possession.

Summer passed, autumn came, followed by a cruel winter. The young man laboured on. He worked very hard. He asked for additional employment, and obtained permission to do some official work at home, which brought him in some extra shillings, which he carefully stowed away, longing for the day when his hoard would reach the amount requisite to redeem the dressing case.

All that winter, the men who saw him at his work watched the fading away of the life of this poor 'portrait'. His face became perfectly white, with a dreadful flush on each cheek, which told its tale to the most casual observer. And for those who could not see the evidence in his face, there was the testimony of that ever recurring cough. It was so bad, that, poor fellow, he had frequently to leave the room—the light labour of the comfortable clerks being interrupted by his hacking, which at times would finish almost in a spasm. Still he plodded on. Spring came. The home of the 'portrait', by the joint efforts of his mother, sister, and self, was somehow kept over their heads. His secret fund had increased very slowly, but steadily, and now reached five pounds. Other two pounds, or a little more, and the object of the young man's hard labour of many weary months would be accomplished.

The month of June arrived, and the money required by the writer for what had been the purpose of his life since that morning when he spat blood in Blackman Street—now nearly a year ago—was made up during the four weeks of this the most beautiful month of all the year. But at what a price was the object of the poor fellow attained! He was the mere shadow of a man that moved nervously and swiftly to and from its work day by day, rather than a being of flesh and blood, belonging to the same race as the robust crowd of City men through which he passed, with a 'fix all look' within his eyes.

At last the anniversary of the day on which he had pawned his father's dressing case came, and with trembling, transparent fingers, he nervously counted over his little savings ere setting out for his work. The money he put into his pocket together with the pawn ticket, and all that day he surprised the other writers and the clerks with whom he worked by the cheerfulness of his manner and the alacrity with which he performed his official labours. He even made jokes! He rallied some of the men who were slow in doing their work, but while making fun of them, he helped them to do it. His high spirits went, it must be admitted, rather ghostly, and contracted but all with his alarming appear-

ance, and when five o'clock came, the writer walked out from his office with a more erect frame, and with a happier look on his wasted face than he had had for many a long day.

On his way home, he entered the dark door-way of the pawnbroker's shop in Blackman Street, and gave up his ticket and his little hoard of money, and received the heavy box, which had been hidden away for twelve long months. With this burden under his arm, he set off for his home. He was full of pluck and hope, and he was picturing to himself the joyful surprise with which his mother and sister would receive the returned dressing case, when suddenly a hard spring seized his chest, as it were, and seemed to stop his heart. He put his parcel down on the pavement of the busy Borough thoroughfare and gasped for breath. Then came the cough again. When this was over, the poor writer could hardly stand. Some kind of prison, going by, seeing that he was very ill, called a cab and put him in it, his box into it.

The cab arrived at the poor little Peckham cottage with the returned dressing case, and the writer—dead!

## THE MAN IN POSSESSION.

### IN LIFE CHANGING—CHAPTER II.

As I quietly glided across the entrance lobby of Barkleigh Hall, in the wake of Mrs Stokes and the housekeeper I looked about hurriedly for some place within which I could conceal myself for a few minutes. The scullery door stood open. There was no one within the room. I stepped in, and gently closing the door, waited patiently, listening for the unloading of the reinettes of the linen and the departure of Mrs Stokes. What she thought of my sudden disappearance, I am unable to state. She did not, however, to my knowledge, express openly any manifestation of surprise. Perhaps she feared that if she did so, it might implicate her in some unpleasant affair, and therefore wisely chose to be silent, or, more probably, thought that I was, as she expressed it, 'a friend of the family, stealing upon them unawares.'

Waiting my opportunity when the coast seemed clear I stealthily sallied forth, and made for the entrance hall and for the principal staircase. Probably the dog had not been unchained, for I neither saw nor heard anything of him. On reaching the first landing, I observed a door partly open. The room was superbly furnished. 'The drawing-room,' said I to myself. Within, in an easy chair, sat a gentleman considerably past middle age, but tall and robust. The first glance at his countenance revealed a compound of the repulsive and the cunning, mingled with deep traces of continuous dissipation. He was reading a newspaper. I hesitated a moment, and then stepped boldly into the room. He looked up with an impatient expression of surprise and annoyance.

'Mr Wintock, I presume?'—making a low bow.

'What do you want here, fellow?' he replied, starting to his feet. 'How dare you intrude into a gentleman's mansion and private apartment after this fashion?'

'Very sorry to discommode you, sir, but business is business, though it is sometimes rather unpleasant. I am here on the part of Mr Wadley. And then I briefly explained the nature of my commission, and showed him my authority.

He got into a towering passion, and turning to the mantel piece, rang the bell violently. 'You sneaking, pettifoggish brumby, leave my house this instant—Hut, Benetti!'—raising his voice—'Benetti, you rascal, I want you—Martha, loose the dog!'

Quietly walking to the door, I shut it, turned the key, and set my back to it.

Mr Wintock seized the heavy drawing room poker and advanced towards me. 'You scoundrel! unlock that door, and stand out of the way this instant, or I'll smash—'

'Oh, if that's your game, governor, you had better not try it on,' I interrupted, drawing one of my pocket companions and just showing him the muzzle, for my blood began to warm. 'I don't want to do anything uncomfortable but you know self preservation is the first law of nature. If you are going to knock a hole in my cranium, I shall try and drill it in yours. Not perfectly legal yet, perhaps, but certainly expedient under the circumstances.—Now, sir,' I continued, 'it is no use your getting into a passion with me, because I'm only an agent, you see, and obliged to do the bidding of my superior. Besides, you will only make matters worse.'

The first outbreak of passion over, he calmed down a little. 'Will that be true?' he replied, as far as it goes. And how on earth you contrived to get in, I don't imagine.

'All stratagems, sir, are fair in war, you know.'

'Did you get in—through one of my people?'

'No, sir, I did not.'

'Hem!' he muttered to himself, 'I am glad there are no visitors in the camp.—They need not have been so sharp with me,' he continued, addressing me. 'The money will be paid without fail in a week at the latest.'

'Extremely glad to hear it indeed, sir. I sincerely hope it will. In that case, you need not care about my troubling you for a few days. I don't wish to interfere with your family arrangements in any way, or to do anything inconvenient with my duty. Good-bye me cordially and tell me fairly, and you'll surely know I am here. I'm used to the sort of thing, sir, you need not mind me in the least, I can assure you.'

He had put down the poker, and was leaning against the mantel piece. Some one tried the door, and then tapped. 'Did you ring, sir?' It was Martha's voice.

I unlocked the door, and stood behind it.

Mr Wintock stepped across the room and opened it. 'Come again in a quarter of an hour.'

'Very well, sir.'

Martha retraced her steps down-stairs.

'Now, Mr—'

'Meredit, sir, at your service.'

'Mr Meredit, then, as you seem to be a reasonable fellow, perhaps, all things considered,

it will be as well to waive my first intention of pitching you headlong out of the window, and try to accommodate you during your brief stay as well as our humble and limited means will permit.' He said this with an air of chagrin and sarcasm that told plainly how much he was irritated at being overmatched. 'Meanwhile, you shall, as you request, lodge well and be full well until you take your usual departure.'

Some further conversation, relative to the matter in hand, followed, and after a short time, he rang again for Martha, who after a brief colloquy received instructions to conduct me to the apartment I was for the nonce to occupy.

'Mr Meredit, he said as I was bowing myself out of the room, 'there is one thing I should wish you to understand. We are very quiet people, and dislike being disturbed at night. The dog has usually the ring of the house after ten o'clock. It would be as well to keep your room after that hour till the events are about in the morning. He is extremely tame and docile, and some accident might occur.'

'Indeed, Mr Wintock! Then would it not be advisable, to avoid all risk, to keep him constantly chained up?' I had my hand cardily on my breast-pocket as I spoke.

He understood the hint, and replied good humouredly. 'Well, well, perhaps, it would—Martha tell Benetti to see to it.'

He concluded a midnight departure, thought I, as I left the drawing room. 'We shall see,' and I resolved to be more than ordinarily vigilant.

The room allotted for my temporary accommodation was in an upper story, in an angle of the building, overlooking the most pleasant part of the park, and on the opposite side to that more immediately tenanted by the family. It was comfortably furnished, and my meals were regularly and liberally served. I did not, however, get much repose. Mr Chief's caution, to sleep with one eye open, Mr Wintock's behaviour at our first meeting, and especially his hint about the dog, together with the just suspicion with which Benetti evidently watched my every movement whenever I left my apartment—determined me to keep on the alert. It was my custom to remain the greater part of the night in my room, sometimes with a light, oftener without one, and as the weather was tolerably warm, not unfrequently with the window open. What sleep I had was chiefly by snatches in the day time.

It was on the fifth night after establishing myself in my quarters in the Hall, and the great clock had struck the solemn hour of twelve. The house was wrapped in silence, not a sound seemed to break the stillness of the night. I had been reading, and overcome either by the lassitude consequent upon being shut up for several days, or the drowsy attendant upon a protracted period of watchfulness, or perhaps by both, had dropped off into a dreamy doze. On the other side of the room—a spacious one—and opposite the centre table at which I was sitting, hung a large mirror, behind which was the door, shielded by a very handsome screen covered with richly ornamented oriental designs. Something partially roused me, and I looked up in that half-conscious, half-remorseful state subsequent to what is

denominated as 'forty winks.' My candle was flickering in the socket. By its varying and fast decreasing light stood dimly revealed in the reflection of the mirror before me, the vision of a hag-ridden female face, peering at me intently round the extreme fold of the screen, which reached to within a yard of my chair. Such an expression I had never before seen on mortal physiognomy, nor ever wish to see again. Long, raven black hair hung dishevelled over a face, pale and haggard, the bloodless lips closed over the clenched teeth with desperate resolution, the brilliant flaring eyes glittered with an almost maniacal light, yet, distorted as were the features, they still bore traces of singular beauty. For the first time since entering the Hall, the strange story of the 'white face,' which I had heard at the Three Nags, flashed across my memory. For a moment, awe and reverance seemed to seize, and I had well nigh fallen from my chair. Suddenly, the lips parted in an attempt to speak, and the figure extended its attenuated arm, as if to touch me. At the same moment, a bony hand was placed over its mouth, and it was forcibly dragged, or rather lifted back behind the screen just as my expiring candle relapsed for an instant and shot up its last bright gleam. Then all was dark.

Springing to my feet, I rushed to the door, overturning both chair and screen in my haste. There was neither trace nor sound of any one near my chamber. The lofty staircase, the long passages, were silent and desolate. It was with sensations not to be described that I returned to my room, lighted a fresh candle and sat watching and listening eagerly the remaining part of the night, but nothing further occurred. Nor was there the next day, on the part of the inmates, the most trifling indication that anything unusual had occurred. I forbore to ask any questions, and kept my own counsel, determining, however, as far as possible, to unravel the mystery.

With this purpose in mind, I resolved not to confine myself so closely to my room as heretofore. Of the supernatural I did not for a moment dream, but it did strike me that the face said to be occasionally seen at the windows, and which had certainly appeared to me, might possibly be a clever device, in the one case to frighten unwelcome visitors from the premises, in the other to bring about my own speedy departure. Yet that dark sneaky hand—unless the whole thing were a delusion on my part—evidently coerced and prevented the unknown of the figure. Then, again, it occurred to me that possibly it might be some unseen member of the family, whom it was desirable to keep secluded, and yet not necessary to send away to an asylum, and who had during the night broken away from restraint. If so, what right had I to interfere, or to intrude myself upon Mr Wintock's private affairs? I could not satisfy myself, and wasted in a fever of excitement for some days to guide me. So intensely absorbed did I become, so nervously anxious to discover the locality of my mysterious visitor, that I almost forgot the special business upon which I was engaged.

The next few nights passed without any further interruption of my privacy. My overwrought

feelings gradually cooled down, and I began to question within myself whether or not the whole transaction was not a creation of my own imagination, a horrible nightmare, consequent upon the uneasy position in which I had sat and dozed. Dispassionate reasoning had almost brought me to this conclusion, when all doubts were solved by what shortly afterwards occurred.

Though of course I had the liberty of the whole house, which to a certain extent I availed myself of, it was my custom, at intervals during the day, to stand for a while at the open window of my room, to inhale the health-giving air, the fresh country air wafted over the dampness of that noble park. My room had indeed two windows, but one of them only looked out upon a receding angle of the house, a few feet distant, the other, at which I generally stood, commanded a view of the whole park. Rural scenery is to me at all times an exquisite delight. I have stood for hours at that ancient Gothic window, gazing upon the grand old trees and broad expanses of sward, decked with bright spring flowers, and living with enthusiasm to the melody of the countless merry song birds that broke upon the stillness of that dreary mansion.

One evening, just at dusk, I was leaning out, watching the fading twilight, and deeply intent upon the liquid music of a couple of nightingales, which had taken up their abode in a cluster of trees not far from the house, and were warbling their ravishing strains with thrilling effect in the solemn stillness of that deserted park. As I listened to them, some tiny scrap of a material of fine texture, apparently cut or torn from a lady's dress, dropped fluttering past me from above. On looking up, I beheld—attached to an improvised line of the same material, consisting of strips tied together, and which was evidently let down from an upper window—a white pocket handkerchief loosely folded. I could just discern a hand signalling me to secure the handkerchief. Though startled, I lost not a moment in doing so. The line was withdrawn, and the hand immediately disappeared. Shutting the window, I struck a light, and sat down in no little haste to ascertain what this night mean. On opening the handkerchief, I found the interior covered with writing in large characters, not inscribed with pen or pencil, but seemingly traced with a piece of coal or a portion of burnt stick. With some difficulty, I deciphered the writing, as follows:

SK—I beseech you to pity and aid an unfortunate lady, imprisoned in her own house, and deprived of her rightful property by the greatest villainy. If you are a gentleman, be the instrument of my release.—Next room but one to the roof—same size and arrangement of windows as your own—locked in. MARIA WINTOCK.

'Then the tale I heard of the Three Nags has some foundation after all,' I inwardly exclaimed, as every nerve trembled with excitement. Refolding the handkerchief, I leaned back in my chair to cogitate upon this strange communication. 'The Hall is indeed haunted, yet by no spirit, but a being of flesh and blood. This is no maniac's epistle, nor was the apparition in my room a freak of my imagination. No wonder the young lady disappeared so suddenly.—Ah, Mr Wintock,

that is your scheme, is it?—a prisoner till she accepts the hand of your worthless profligate son, and then her fortune will be a nice plum to relieve you from your difficulties? I wonder you have not killed her outright, but I suppose that would not serve your purpose—Help you, poor lady! Yes, that Jack Meredith will, scapegrace as he has been, if he has but half a chance. But how!

Ay, how! There was the rob. My duty for bade me to leave the house for sometime, and if I did so, I might not be able to effect an entrance again, and supposing this gained, might she not in the meantime be spirited away far beyond risk of discovery? Should I resort to open violence, the odds were terribly against me. George Wintock, doubtless a strong, active fellow in ripe manhood, his father, an misnomer by no means to be despised, and that brutal-looking Italian, who seemed to possess the strength of a second Hercules. That scheme would not work. What should I do! How communicate with my fair and oppressed correspondent?

After some consideration, it occurred to me that unless prevented, she would doubtless be on the watch for some kind of reply, and that I might avail myself of the same method of communication which she had tried with success. Taking out my pocket book, and tearing from it a dozen leaves, I wrote on one of them as follows:

MADAM—I am only a bull in possession, but hourly at your service. I will be at the window to-morrow night when the Hall clock strikes ten. Tell me how I can wait you. If you are prevented communicating with me then, let the little scraps fall as before as soon as an opportunity offers. I will keep a sharp look out.—Your obedient servant, J. MANSOURI

Tying this and the blank leaf, along with a piece of stout twine for her use in future communications, in a roll with one of my pencils, and extinguishing my candle, I reopened the window. All was quiet without, and starting her white handkerchief to the end of my walking stick, I thrust it out and waved it backwards and forwards several times. The signal was perceived. The casement above was softly opened, and the line was again let down. Looping my note safely to the line, I had the satisfaction of seeing it ascend to its destination. It was eagerly clutched by the occupant above, her window was again softly closed, and I retired—but not to sleep, for every sense was streaming with tumultuous excitement.

On the following evening, faithful to my promise, I was at my window a few minutes before ten. As the Hall clock boomed the last stroke, I felt a small roll of paper secure in my hand, and as before, retired to peruse it.

GEORGE'S SON—I am most indebted. Oh, help me, for the love of humanity! I am threatened with the most horrible fate, unless I consent to be dragged into a union with the younger Wintock, whom I utterly loathe, or to make over the greater part of my property to him and his father. They have more than once hinted at immuring me in a private lunatic asylum for life. Such things have been done. At times I feel as if I really were insane. Can

you not procure assistance, and free me from these wretches? Surely the law is sufficiently powerful to protect you in using a defenceless, but grossly abused and oppressed girl. I have now been here several years, and hope in all but certain gushard. They have kept me constantly locked up in my room since the night I succeeded in reaching you, as I had hoped unobscured. Previous to then, I was only confined to the upper suite of apartments. I entreat you not to desert me. Oh, contrive some means of setting me free, and earn the everlasting gratitude of

M. WINTOCK.

P.S.—I will let down for your reply at this time to-morrow evening, unless prevented.—P.S. we of Bessie

'Well,' thought I, 'this is an adventure. But how is it to be accomplished?' After much consideration, I fancied that I had hit upon a scheme, and determined to communicate it to Mrs. Wintock, and, if she thought it feasible, put it in practice without delay. It met with her approbation, and we at once proceeded to execute it. The plan, however, required delicate handling, with courage, calmness, and resolution to carry it out. I told her the nature of the responsibility I should incur in deserting my post, but she urged me to undertake her release at all hazards, promising herself to liquidate my liabilities which might arise in consequence, so soon as she should be restored to the outer world and able to resume the disposition of her property. She had been detained a prisoner in the Hall since she was seventeen years of age. She had now just turned twenty-one. Her guardian had therefore no longer any legal authority over her. I felt that the urgency and peculiarity of the case would insure me lenient judgment, if not condonation for my breach of trust, in the minds of the right-thinking men.

'Be ready at two to-morrow morning,' was my last billet, forwarded in the usual manner, 'while the Wintocks are probably asleep. Keep up your courage, and have the rest to me.'

I chose the hour of two o'clock in the morning for attempting the rescue of the young lady, as having the greatest chance of success, for notwithstanding Mr. Wintock's hint that the family disliked being disturbed at night, I had discovered that both he and his son were in the habit of spending some part of it from home—where, I cannot say, but probably in some kind of dissipation. Both went out about nine o'clock. Mr. Wintock usually returned about one. His son was much more uncertain.

I have said that the entire edifice, and especially the roof, were of very irregular build, and that my room was situated at an angle of the house. On the other side of the angle was a suite of rooms but little used, the window of one of them being exactly on a level with Mrs. Wintock's, and about six feet distant from it, and to which room I discovered I could find access. Immediately above the room in question was a lumber room, with a ladder from the floor to the trap door opening out upon the roof. Carefully watching in opportunity the next day, I slipped into the lumber room, in which, among other things, were a number of tools of various descriptions, and armed myself with a couple of stout screw drivers,

with a hush I retreated, after noting, that the ladder might easily be removed.

A little before two o'clock found me cautiously issuing from my apartment and stealthily creeping towards this part of the building. I did not much fear any alarm from the dog, as during my stay he had been kept chained up in the other part of the mansion. I suppose Mr Wintock had provoked by my hint respecting the animal. Pursuing myself of the ladder, I very quietly removed it to the room whose window I have described as being, opposite to and on a level with Miss Wintock's. The next were moments of breathless anxiety and suspense. Slowly opening the window, I waved her own white kerchief—the signal a red upon between us—and her window was then as quick as I then proceeded to push the ladder very gently as it was until it rested up in the sill of her, forming a narrow bridge from my window to window. She was at her post, and grasping the top staff held it firmly, keeping herself astride. I gradually shifted a few inches at a time until I reached her. The Hall clock struck two as I stepped softly into her room, immediately withdrawing the ladder and closing the window. She was greatly startled and trembled violently. Taking my hand in both her own, she whispered a few words of unexpressed thanks, and then we addressed ourselves to the task of getting out of and away from the house as quickly as possible. This we felt would be no easy matter, for not only was the door of her own room locked but also that of the room into which it opened, and through which we must pass before gaining the corridor which led to the staircase. For a few minutes, by use of the noise, and indeed it would have been difficult to force the door, as both were of stout oak. Hence my provision of the screw driver.

The screws were rusted with age, and I was too little skilled in carpentry to work in the dark. I therefore lighted a candle I had brought with me, and laboured heavily for about an hour. Miss Wintock leaning over me to aid me with it, until her long raven hair rested curiously on my shoulder, she holding and shading the candle with my hat, lest its reflection should betray us to any one out of doors. As George Wintock in his return home from his midnight revels might observe it in crossing the park. At length I was successful, the last screw of the second door yielded. Extinguishing the light, we paused a few minutes to listen, and then stepped softly out into the dark corridor, I leading the way, pistol in hand, and Miss Wintock leaning heavily on my arm.

Along the corridor and down the richly carpeted staircase we went on tip-toe and with bated breath, lest the echoes of that gloomy old mansion should arouse her jailer. Every moment we expected the dog to give tongue. The night was cloudy; but suddenly the moon emerged from behind a cloud, and for a few seconds illumined the sombreness of the antique entrance hall. I felt Miss Wintock start and shudder, press my arm and cling still closer to me, with the confidence of a very child. It made my heart leap, and every drop of blood in my veins thrilled with a feeling of rapturous delight, hitherto unknown to me. I seemed for the moment to have the strength of twenty men, and almost

longed to do battle on her behalf. We stood for a moment in the hall, undecided whether to try one of the long passages, or at once seek egress by the principal entrance. We chose the latter. Softly we passed across the polished oaken floor, and I began slowly and with extreme caution to undo the fastenings. Gently, one by one, each bolt and bar was withdrawn, the huge lock was turned, and the ponderous door swung heavily upon its hinges. Greatly exhilarated at our success, I turned to my companion with a whispered word of encouragement on my lips, when an unseen enemy struck me a tremendous blow on the head, driving me through the open doorway like a ball from a cricket, and falling me like a log upon the gravel walk beyond. At the same instant a succession of piercing shrieks, so wild, so heartrending, and despairing, burst from Miss Wintock, that it seemed as if her reason was passing away in a continuation of convulsive efforts to regain her liberty.

How long I lay motionless upon that cold gravel walk I cannot say, but it could not have been many minutes. Probably my assailant was for the time too fully occupied in securing the recaptured lady to be able to inflict any further injury upon me. When I regained consciousness, the moon was obscured, and it was intensely dark, not a star being visible. Bruised, sore, and blinding, I gathered myself up as best I could, and endeavoured to collect my thoughts. But in what manner to act for the best, puzzled me. Should I wait till dawn, then hasten to the village, and endeavour to procure assistance in securing the young lady? For several reasons, I discarded this idea. Besides, I had in fact neglected my duty, and in justice to my employer, ought never to have attempted leaving the house. What was I to do?

## INTOXICANA.

ALL MIDDLE CLASS are by no means the only intercomers known and used by oblivion seeking humanity in different parts of the globe. Bhang, or Indian hemp, is consumed largely among the Hindu and Malaya, and produces wild temporary delirium, during which homicidal mania is constantly prominent. If the practice be continued, it invariably ends in incurable and rapidly fatal madness. Opium eating and smoking, unfortunately, are not confined to China or the Chinese. There are houses in London, known to the initiate, where the dreamy pipe is always glowing; hot with charcoal, ready for the tiny ball of precious resin, and seldom out of its quoniam, while the statistics of wholesale and retail druggists lead us to infer that much is taken habitually in private in various forms.

The consumption of opium is said to be especially great among the labouring classes in the Fcn districts, by whom, however, it is probably taken not as a luxury, but as the only relief they can obtain for the ague and rheumatism which rack and burn them chronically every second or third day. Quinine costs more than landrum, and so the latter grows on them till, from the relief it gives, it becomes an inextinguishable

vici. The habit of opium smoking is far more pernicious, if persisted in, than that of opium eating, but the ludicrous nausea and headache which follow the tianic, even with seasoned smokers, must often act as a deterrent. The pleasurable effects produced by the pipe are said far to exceed those which follow the internal use of the drug. In cities where this practice prevails, one can always tell an opium smoker at a glance by his glassy pupils, yellow lips, and wandering far off eyes.

Opium, though less expensive than quinine, is still costly enough in this country to prohibit its general use, the best being worth about seventy shillings per pound. Intoxication by this agent seems to be the most absorbing and irreducible of all various propensities, and the victim is obliged to constantly increase the amount of his daily poison in order to arouse the sensations it produces, so that in some cases laudanum has been swallowed by the same gluttonous and still opium by drachms—the medicinal dose of the former being from five to thirty drops, and of the latter, half a grain to two grains. Morphia does not seem to have the same effect in this connection, at any rate, it is not used for the same purpose, though occasionally we hear of those who have become habituated to its sedulous injection during illness, being, until, or unwilling to dispense with it after recovery.

Scarcely one opium drunkard in ten thousand is reclaimed. When a man has once acquired the habit, he may be looked upon as having less chance of it one than the most inveterate masturbator from other sins. Dr. Quincy and others have left us graphic accounts of the agony they endured in giving up the drug and the almost superhuman fortitude necessary to accomplish the sacrifice. In countries where there is much Chinese immigration—China, Cuba, and the Western States—the most stringent restrictions on the import and sale of opium are established; otherwise, John Chinaman would rapidly degenerate, from being the most decent fellow in the world, into a burden and a nuisance.

There is a curious distinction to be drawn between the alcohol drunkard and the connoisseur of brandy, opium, hashish, and other brain heating narcotics. The former drinks for the pleasure of drinking, for the gratification of the palate, and may be said to get tipsy accidentally—though commonly with a sufficient knowledge and recklessness of the result of his potation, to constitute him guilty of 'culpable negligence' at the very least. In spite of all the homilies, a large about 'drowning dull care,' and odes to Bacchus and the 'bowl' and the 'cup,' few men set down with the deliberate intention of drinking themselves into a state of unconsciousness or temporary insanity. On the other hand, he who swallows or inhales the fumes of the above mentioned drugs, which are extremely nauseous,

does so expressly for the sake of the stupor, fantasy, or frenzy they induce, and usually swades the flavour of them as far as possible.

Chinai and Lan do Cologne have been declared to be secretly much in vogue, especially with ladies, but this branch of the subject of Intoxicana has been already treated in No 986 of this Journal.

Inhalation of minute amounts of Chloroform are the latest vices laid to the charge of the fair sex. Ether, no doubt, is more extensively employed, but, for some unexplained reason, its use is almost confined to the lower classes in the north of Ireland, where it actually supersedes whisky to a great extent. Spirit of wine is not allowed to be sold in this country except for medical purposes, unless it is first 'methylated' with wood spirit, which gives it an odour and flavour too unpleasant to allow of its substitution for more expensive and less powerful brandy or whisky. It is a very fortunate circumstance that in sugar growing countries, where the distillate of the refuse—nearly pure alcohol, known as *cacha*, *cane*, *cachama*, *ajualink* or white rum—is cheaper than milk, the inhabitants are not much given to intemperance, intemperance being very fatal in such climates. In the south of Russia, the peasants become intoxicated on a certain kind of fungus, which is found to develop narcotic properties if dried and stored for some time.

The term 'tea drunkard' is well known throughout Russia, and implies not the abuse of reboiling any spirit distilled from the herb, but that the cup which cheers intoxicates also, if recklessly adhered to. Strong tea is well known to be a powerful though fleeting, excitant of the nervous system, and if the reader likes to make the experiment, let him drink a dozen or fifteen cups of tea in the Russian style—that is, without cream or sugar, but flavoured with a drop of lemon juice—in the space of a couple of hours, and he may arrive at the conclusion that there is something rational about such an antithesis as tea drunkard and all.

In many lands, the juices of various plants and trees are collected and allowed to ferment, or are sometimes drunk after undergoing a vinous change in the plant itself. Cocoa nut water, found in the green pod before the fibrous husk and nut as we know them here are formed, is often used in this way, but as it is no means attractive to European palates. Kaidu and Tartars make a fermented liquor from mare's milk, and honey forms the basis of many drinks in different parts of the world, being familiar to us as mead. Real guinea beer—not the sour, scummy stuff sold in bottles under that name, but the really and truly brewed from guinea, and capital stuff it is not to be trifled with. A similar compound is prepared from peppers in the West Indies. In the villages on the banks of the river Dart in Devonshire, white beer—ah, with the yeast remaining in it—is a favourite tipple. Those who are accustomed to drink white beer, hold the cup in their hand, and keep it agitated by a constant circular motion until they have finished the

contents, so that a knot of labourers or fishermen, encamping together outside some rustic skoshen on a summer evening, presents rather a grotesque spectacle to the tourist in this part of England, and lends him to believe that a Home for Paupered Inebriates must exist somewhere in the vicinity.

If there are many things on which to get intoxicated, there are still more forms of intoxication. These vary principally with the individual, and here, again, it is a well known fact that the quantity which a man may drink at one time with impunity will cause to overtake him at another. Much depends upon the state of health, the presence or absence of food in the stomach, the question of habit, as to the time of day, the mental condition at the moment—an excited person being much more quickly affected than one whose mind is tranquil—and the nature of the liquor, for different people are susceptible to spirits, wine, or beer in different degrees, which do not always correspond with the proportions of alcohol which those fluids contain. Mixing one's liquors is proverbially unwise, yet at the dinner table, one may take half a dozen wines in succession with a result which might be different if no food were taken concurrently. Brandy, whisky, holland, rum, gin, &c. contain from forty to sixty per cent of absolute alcohol, liqueurs, about the same amount, wine, from ten to twenty eight per cent, beer, from three to eight, and, from the nearest trees up to three or four, according to its age.

Some men seem to become drunk suddenly, giving no previous indication by the known of articulation or unsteadiness of gait, this being commonly the case where mental excitement from other causes—as a heated discussion—prevails at the time. The most heedful and astounding cases are afforded by these unfortunate people who are never sober. How they manage to survive so long as they do, is a mystery. There are men who have been perpetually under the influence of liquor for twenty or thirty years. Of course, the brain must have become permanently injured, so that we may infer that the drink these persons now take has little or no real effect on them, and that their state would be just the same without it. Others, again, are systematic and punctilious drunkards of regular habits, men who take their quantum and are put to bed unconscious every night, yet are capable of attending to their daily business in the most extraordinary manner. These, as a rule, never exceed a given amount by as much as a glass, and do not suffer so much as intermittent drunkards—at any rate not so soon, for the inevitable consequence is only a little longer deferred. The writer knew an old doctor in Jamaica who used to aver that the climate was the finest in the world 'Yellow-fever, sir?' he would exclaim—'not a bit of it! A vulgar chumera! A malicious libel on us! The fact is, it's the vicious irregular drinking habits of the people here that kills 'em. Look at me! I drink a bottle of brandy every night, and have done so for thirty years. I get tipsy seven times a week, in an orderly and decent manner, and I've never had yellow fever nor a day's illness! And to all appearance he was a fine healthy man of sixty five or seventy, with

a beard as white as snow. Yet he was carried off suddenly by a trifling indisposition incidental to the climate, and it was found on examination of his papers after death that his age was only fifty two.

It does not by any means follow, either, that because a man is never intoxicated he may not be drinking too much. Men employed in the port breweries in London, especially the draymen, consume an enormous quantity of beer. The duty allows one which their employers give them a very large one, but they rarely confine themselves to that, and the draymen, in addition, get much gratuitously from the customers to whom they are always delivering the casks, so that ten or fourteen quarts is no exceptional consumption for one man, yet they are not drunkards, in the ordinary sense of the term. The very nature of their work necessitates the employment of stout but steady men, strength being also a necessary quality. But if one of these men should break a limb, or get confined to bed from any other accident, he is almost sure to get skilium treatment, and a scalp wound frequently kills him. Drunken men are notorious in hospitals as being the worst cases for operation, being prone to exhibit all the most dangerous complications which fetter the success of surgical treatment.

It may be truly declared that no one ever exceeds in the use of intoxicating fluids—the excess little or much—without suffering for it at some time or other. Obviously, not even the broadest general rule can be laid down as to the quantity each may take. There can be no doubt that alcohol is of great benefit to many people both as a medicine and a food, there can be no little doubt that many more would be better without it, and that many might dispense with it altogether without any harm resulting.

Men grow unstable, violent, solemn, sentimental, depending, distrustful, quarrelsome, fitful, or mad in their cups, and some pass through all these phases in turn. The abnormalities which they commit under the influence of these varying emotions are often in the highest degree painful or ridiculous, and have always been a favourite theme with satirists of both pen and pencil.

As living exemplars of intoxication in its two aspects, better examples could not be quoted than Mr Charles Warner's terribly realistic performance of Compeau in *Drunk*, on the one side, and on the other, Mr J B Clarke, the American comedian, as Toodles in the drunken scene of that delightful farce. It would make an exciting laugh to watch his face, in which solemnity seems to struggle with a consciousness that he is not 'quite the thing,' as he stands at the front of the stage for five minutes, never speaking a word, endeavouring to put on his glove. His hand slips from the hem of the glove to his coat cuff, at which he pulls and pulls until it is drawn nearly up to the elbow, while the fingers wriggle as usual to facilitate their entrance in their proper receptacles. His necktie is disordered, one long end sticks out straight, and every now and then his eye runs along this with an expression of surprise that is simply overwhelming, and when at last this end becomes evidently nerved up in his calculations with the number of fingers to

the glove, the house was fairly "brought down" with laughter.

The writer once met with a parallel to the old story about 'got 'em again,' on board a steamer in the West Indies. A passenger, occupying one of the main-deck cabins, experienced certain strange manifestations for several nights in succession after he had retired to rest, so hideous in their nature that he was nearly driven mad. Unhappily, this gentleman had a propensity for intemperance, and feared to mention his nocturnal persecutions, lest they should shame him in the eyes of all his fellow passengers, by turning out to be the product of a deranged brain—delirium tremens. But he wasn't so bad as that, for a huge land crab as big as a dinner plate, which had somehow found its way into his cabin, was at length discovered there. What the poor fellow must have suffered nightly with this awful crustacean crawling over him, must have been enough to drive any one mad.

While the writer was surgeon of a steamer on a foreign station as we lay in harbour one night, some of the officers from another ship paid us a visit. They were sailing for England on the next day but one, and possibly had been sick during the event not wisely nor yet well, at myria, one of them was certainly in that condition which proverbial philosophy labelled as 'a lord, and from which it kindly exempts judges. It is to be feared that shipboard hospitality did not by any means tend towards his recovery. Probably his comrades were a little oblivious of things in general also, for they rowed away manfully at a late hour and left him behind, and about an hour afterwards, our third officer came to me and told me that A—— was still on board. Could I give him anything to 'pull him together?' A glance showed me that the pulling of him together was out of the question for some hours. What was to be done? Work was going on busily on board the ship all night, taking in stores and cargo for the homeward voyage, and if the captain discovered his prolonged absence, it might get him into serious trouble. So, not to disgrace him before the men, we lowered the dingy, put him in, and sculled him across by ourselves. We thought we should have had to carry him up the companion ladder, but when we hoisted him on to the lower step, he seemed to recover himself, and ran up without assistance. Taking it for granted that he would be all right when he got among his friends on deck, we pulled away again, amid the rattle of steam whistles, the clanking of cranes, and shouts of the riggers stowing the heavy bales in the holds.

Restored to sanity next morning, he came on board to thank me. 'I can't thank how it happened,' said [Poor fellow, he never could]. 'I can't thank how it was, but I haven't the slightest recollection of leaving here or of your sculling me over, until my feet touched the ladder, and then I knew where I was directly. I got on deck, and felt as comfortable as possible then, not quite right, you know, but reasonable enough. I know what I was about. You hadn't been long gone, before there was a commotion forward. I knew that some accident had happened, for I heard somebody say there was a man overboard. However, I was wise enough by that time to know that I was not in a fit

state to render any assistance, so I did not take much notice of it—until I felt a boat hook in the back of my neck, and found that I was the man overboard.'

## ATHLETES

### IN TWO PARTS—PART II

THE practice of lofty tumbling without a net is so manifestly reprehensible that it needs neither comment nor condemnation here, but it is a curious fact that many more accidents are recorded of ground tumbling than of aerial gymnastics. A member of the Hanlon Volta troupe, who has been doing acrobatic business all his life, told me that he never met with a mishap but once, and that was in descending from a bar only his own height above the stage, when he sprained his knee rather severely. And it is a significant circumstance, which cannot be too strongly noted, that the comparatively few accidents which have happened to gymnasts have nearly all occurred through defects in the 'lifting apparatus,' the net. When this belongs to the performers, it is generally spread under his own supervision, and the strength of its texture and fastenings carefully tried, and renewed if required, but when the net is a stock property of a place of entertainment, or, worse still, is provided by an entrepreneur who, not a performer himself, farms the gymnast, and undertakes to find all the apparatus, dangerous material and insecure attachments are apt to be overlooked.

The descent into the net itself is said to be not altogether devoid of danger, and an improper use of current opinion, these people that to fall upon the side of the herd will inevitably break the neck. I am not aware, however, that any case has been known to bear out this theory. Many gymnasts now dispense with the rug or carpets with which the net is commonly padded, on account of their interfering with the view of those seated underneath, and come down upon the naked meshes without injury. A certain 'Little Bob'—a fine young man now—who has been celebrated for preeminently high dives ever since he was a very small boy, sometimes making a headlong perpendicular descent of eighty feet or so, where the building is lofty enough to permit of it, says that he would have no objection to plunge from a height twice as great into a net of proper tension, and that he has never suffered any inconvenience from the transit through the air or arrest of motion. He comes down in a slightly oblique direction, with the hand extended for effect, after the fashion of a diver, when he sees the net 'getting' air, the arms are withdrawn to the sides and the head is tucked in on the chest, so that he falls upon the shoulder blades and rolls over. In connection with this part of the subject, the elegant and wonderful 'dives' of Lucul at the London Aquarium will doubtless be remembered by many readers.

Your special communications being taken up by an exceedingly high and dusty plume to see some very ingenious mechanism recently invented by a gymnast, was indicated by the enthusiastic arguments, protestations, and twice repeated example of that individual, to take the direct route to

the lower regions—in plain words, to drop from a swinging bar into the cushioned net some fifty feet below. Fingers seemed to assume an iron grip, and the bar to become immovable, even after the trapeze had been brought to a standstill, and the legs drawn up at right angles with the body in a sitting posture, as directed. "Now then, go!" was shouted more than once, before I could unbend those hands which had apparently acquired a permanent rigidity of their own, then the bar and roof with its beams and girders flew away from me, and a tremendous repulse of the folly I was committing rushed upon me, with a distinct presentiment of every detail of every story I had heard of people falling through nets improperly fixed or ill-mended, and a totally independent calculation of the surgical effect which the legs of the inverted chaise I had observed pick up in the air below the apparatus would produce upon the human frame falling from a height, the whole accompanied by a perception that I was gradually, very gradually, inclining backwards, which opened a new vista of the probabilities of my demonstrating the truth of the skeleton's neck theory. I seemed to be suspended between earth and sky for about a week, and was almost reconciled to the position, when I suddenly and unexpectedly found the crimson netting billowing up about me and surging over my face, and woke to the fact that I had really fallen. I landed on my back, flat, but there was no shock, nor indeed was I conscious of having stopped, which perhaps was due to the elasticity and rebound of the net. The only part of the adventure which was disagreeable physically was the walking, or rather stumbling and crawling, over the net to the ladder at the further end, a very quirky, sea-sick sort of business.

Acrobats and gymnasts usually practise during the morning on the stage of some theatre. Even when not working at any new trick, they always practise once a day, if their engagement does not include two performances. Sometimes they have to go through as many as six exercises. When a man intends to bring out some novel and spectacular feat, and wishes to keep it a secret until he is until its production, he hires an empty school room or public hall, or even a theatre, for his own exclusive use, and there practises with his apparatus and assistants until he is quite fit. No stage performance is ever sickness at home. It is somewhat disappointing to find that the same which seems such an inspiring excitement to the spectators is disagreeable to some professionals, who in fact find they would rather be without "brand clatter."

Salaries vary enormously, of course. Of late years, there has been a demand for female gymnasts, and some have been forthcoming, but, as might be expected, they rarely succeed. Still, they draw good houses, and the morbid taste of the public enables some of them to command fifty or a hundred pounds a week. Troupe salaries run even higher than this in exceptional cases, but managers always want something new, something that no other company has presented, and the art is therefore a progressive one. All manner of things are introduced to impart a spice of novelty to old tricks in every department. Acrobats juggle with balls, knives,

hoops, fans, bells, and burning torches while tumbling, or throw some-valuable while playing the violin or tambourine, or mount themselves on roller skates and in yokes. Gymnasts use "fired" from spring boards concealed within a granite cannon, let off just as in their flight through the air, or go through their evolutions under a beam of quibs and rockets. The various "lines" of business too, while not numerous and diversified, are not as distinct and separate as they used to be. Trapeze, flying rings, and horizontal bar work are now combined, poles and ladders still hold their ground, but tight-rope and chain walking—its more easily acquired than any (these—its performance, scaling stuppers, pedestal acrobatics, and modern Samsons, are a thing in the market. (It is feared, by the way, that the climbing, walking, when at one time created such a sensation, was really performed in atmospheric pressure or by magnetism, as was alleged, springs & hooks having been discovered.)

Equilibrium is rather in the ascendant just now. It seems incredible that any one should be able to do it in a chair and maintain it balanced on its legs upon an overhanging bar, or stand upon one leg in a globe resting on the same unstable foundation, acrobats, therefore, and other similar marvels are scarce. I witnessed fifty shillings, a well-rolling globe and a barrel performer at one of these acts, but French comic acrobats, who mix a little ballet with fun with their tumbling, are looking up. Circus troupes include acrobats, and in their own specialties as well. Of the acrobats may be developed from any of these, many of the famous old ones were acrobats and dancers. But it is the mode now to take new departures altogether, and we find acrobats ballet-dancers, dancers and comedy companies, and minstrels, and strolling players who constitute their repertoire, with acrobats and hand springs. Part of the Haulan Volta troupe, famous in Spain, and led from the company, and under the name of the Hamiltons, have converted the theatre-going world with laughter and astonishment at their marvellous acrobatic, gymnastic, and pantomimic impersonations in *Le Pape en Suisse*.

Although most of those who follow this alluring and dangerous career, they are really all English, and English acrobats, like American circusmen, French actresses, Italian men, and German musicians, are noted all over the world. In many parts they are much more highly esteemed than they are here, in South America in countries, for instance, the arrival of a clever gymnast causes as great a sensation as a new prima donna at the opera. They frequently travel in conjunction with circus companies, which on foreign tour are of more extensive proportions than they are at home, and it is strange sometimes, in remote corners of the earth, to find the walls all aflame with some name that was familiar in the Christmas pantomimes or Crystal Palace entertainments of long ago at home. When they have any talking to do, they crack their jokes in English as usual, whatever they may be, and it appears to go down just as well with the audience, who, moreover, applaud vehemently, as an acquaintance with even any single word of the

native language which a performer may have picked up. If you talk to any number of ten years' standing, you will frequently discover that he has been in every quarter of the globe.

Most of these people obtain their engagements through the medium of professional agencies—men who have portfolios of all kinds on their books, and are equally ready to supply a stilt dancer for a garden-fete, or an entire troupe for a five years' tour round the world, on the shortest notice possible. These agents, of course, charge a commission on the salary obtained, when the contract is signed, and receive a fee from the employer besides. There are also a limited number of individuals—generally men who have been in the profession themselves, and have acquired money in it—who, besides owning perhaps two or three companies, and undertaking to supply various places of amusement with a constant succession of acts and newwrought stunts, make a business of inventing novel spectacles in the gymnastic art, and of turning youth, especially the carry them out. As a rule, these novelties involve the use of elaborate and costly apparatus, which would be quite beyond the performer's means to provide, so that the trainer feels peculiarly secure against any double dealing in embarking on the speculation. Very often, indeed, the apparatus is the only novelty about the feat, the *modus operandi* of an old and well-known trick being disguised by new and effective surroundings. A contract for a long term of years—as much as ten or fifteen sometimes—entered into between master and pupil, whereby the former retains the services of the latter at a fixed salary, and can dispose of him as he will. The mechanism is often patented, and the title of the trick is, indeed, and so strictly is the agreement worded, that it would be well nigh impossible, and indeed is rarely attempted, that it happens that good gymnasts have in some cases made the fortune of their inventors, and are themselves compelled still to keep on inventing for an insignificant wage until they are working for us as usual. On the other hand, the probability of failure, or of the feat not 'taking' with the public, and consequent heavy loss in preliminary expenses, must be taken into consideration. The trainer usually manages to have one or two reserve pupils in process of education to the same end, so that if anything happens to the 'Phantom' or 'Volante' or 'Queen of the Air,' who has been handled with such a flourish of trumpets, another steps quietly into his or her shoes and title, and business is carried on as usual without any interruption.

The relations which exist between employer and employed of this last mentioned class probably demand legal scrutiny more than any other part of the subject, since the artist here commits his safety to appliances which are devised and provided for him by others, who must, therefore, be held responsible for their integrity. But things are not looking very favourable for the profession as a whole, just now. Impending legislation threatens to be disastrous for them, and there is a prevalent feeling abroad that they would be better abolished altogether, since they serve no useful purpose, even if they are in nowise prejudicial to common human interests. It

is a great question, looked at from either side. Nobody can deny that an acrobat might be better employed than in turning somersaults on a carpet, but, unfortunately, the same stigma might be cast upon many of the other occupations of mankind. Again, ought anything which tends to the innocent recreation of our fellow-creatures to be condemned as *st. g. g. g. g. g.*? To deprive some thousands of hard-working people of the occupation by which they get their bread, must always be a grave matter. Let it not be forgotten, either, that for the most part they spring from a class which cannot be said to develop, as a rule, into useful members of society, and that in opening what gives the rugged child of the gutter an opportunity of receiving the wages of a well-paid curate by the time he is fourteen, is not to be despised when it entails no sacrifice of health. By all means, let acrobats, children and adults, be protected, regulated, inspected by law, let their whole education be supervised as rigorously as with any other class. If any performer entails a risk of life on himself, let him be punished with the severity such an offence against morality deserves, but let the regulation of all professional details be submitted, as in other special industries of life, to artists who have technical knowledge on such points.

Apocryphal of the immediately right and proper regulation that a net or quilt shall be used by those engaged in lofty tumbling, a very celebrated performer in this line used to say: 'I have seen it stated in the newspapers that we gymnasts ourselves object to these precautions. This is quite untrue, no man pretends to go up without the net. I don't say that we would be unwilling to take the risk for extra money, or that we would not perform without it rather than lose an engagement. But the biggest risk is never done without it, and there isn't one of us, no matter how plucky, but feels anxious before attempting anything new without something soft below. Let the public who are to blame. They would rather see a man do two or three simple turns with the chance of breaking his neck, than the bravest feat in safety—else why is there such a thing as walking on the high rope? Blown his brains would never have paid if the rope had been only three feet above the ground, yet it would have required just as much skill. I have been among the audience myself when some of the best gymnasts have been up and doing the most wonderful tricks ever attempted, and I have heard them say "Yes, it's all very well, but then they can't beat themselves if they miss"—grumbling, actually grumbling.' It would have been better for everybody if a net had been erected on from the very beginning; better for the public, who would get a finer performance, better for the manager, who would not run the risk of losing their lives when an accident occurs (for the last gymnast will occasionally slip); certainly better for us. As it is now, those of us who use the art are cut out by mere amateurs who are too hardy enough to give the little they can do, without the net. Then some

mean, or won't have us all, on account of some recent mishap that has got into the papers, and others growl and ask if we can't go up without a net, saying it disgraces the house to let it, and can't, no end. But the men and the audience to spread it every night. But I know that I'll go back to the low ha and win my business before I'll take my boys up without a net, and what a more, I'll see myself every day, before it's spread, that every book and staple and ring and mesh would be a threat if not be!

## OCCASIONAL NOTES

### AN AMERICAN PROJECT

A variety of a very novel character is in course of construction at Hastings, on the Hudson, United States, America, for which its originator, Mr Robert Fryer of New York, claims advantage, which, if attained, will go far to revolutionise our ocean traffic. This new steamship, which is called the *Oceanic*, is nothing more nor less than a marine triangle. The hull, which is not intended to touch the water, is supported on three hollow steel spheres, one forward and the other two aft. Each of these is fitted with a circular hull, grooved to run upon rails, to enable the vessel to cross in isthmus, or to run ashore whenever repairs or alterations may become necessary. Transversely, these spheres are fitted with flanges, which almost encircle them horizontally, and which will act against the surrounding water just as do the 'floats' of an ordinary paddle wheel thus propelling the ship, so that these hollow globes perform the double office of supporting and propelling the *Oceanic*. The hull itself is built water-tight and is compartmented, in case of accident, so that, in the event of damage to one of her propellers, she will still float buoyantly. Each of these propellers or floats is reversible, and they can be worked irrespectively one of another, by reason of which the *Oceanic* will be capable of turning completely round in her own water—an obvious advantage in many cases of impending collision. A small working model of the *Oceanic* has been recently tried both on the river and on land, and both experiments were perfectly successful.

With regard to her power and speed, it is claimed for the *Oceanic* that she differs from a vessel of the common type just as a wagon mounted on wheels differs from one which having lost its wheels is dragged by main force along the road, for in the case of this new vessel, there is absolutely no friction at all, since her hull does not come into contact with the water. The result is that unprecedented speed, greater safety, and increased accommodation—from her possibly enormous breadth of beam in proportion to her length—are gained by Mr Fryer's invention. The dimensions of the *Oceanic* are length, two hundred and twenty-four feet, and breadth, one hundred and thirty feet, while the floats or wheels are each twenty-four feet in diameter, and are expected to draw about five feet of water when the vessel is loaded.

### THE MULEBERRY-TREE IN FRANCE

Some calculations that have recently been made at the Conservatoire des Arts et Métiers in Paris,

show, that to produce one kilogramme—that is, about 3½ pounds—of cocoons from the silkworm, twenty kilogrammes of mulberry leaves have to be eaten, and to produce one kilogramme of silk, thirteen kilogrammes of cocoons are required. Taking the annual production of silk at two million two hundred and eighty thousand kilogrammes, we find that the weight of leaves required for the food of the silkworms from which this quantity is obtained, amounts to five hundred and ninety-two million kilogrammes, or five hundred and eighty-one thousand two hundred and fifty tons of leaves.

### BLACK MEN AS EMERGENCY CONDUCTORS

In his *Journal from a South African Journey*, Mr Lionel Winks writes: 'On the road to the Vryburg—first experience of camping out. I am alone in my tent with a glaring sun raising the temperature inside to ninety degrees. The mules have died, being unaccountably killed. I sent Chukky my black driver in search of them in the early morning. He returned with his face as near white as nature permitted, declaring that the Vry One had jumped out of the ground at his feet with four young ones. I suppose it was an antelope. Any way, the mules are lost. He has gone back to my first halting place to look for them. My other youth has started with a rifle to shoot back, which we found us in time to shoot him, and here we fly the wail of a pond which is trampled by the antelopes into mud soup, the only stuff in the shape of water which we have to depend on for our coffee, and, alas! for our washing. To add to the plagues of the situation, the scream of the thunder storms has set in. The lightning was playing round us all yesterday afternoon, and we shall now have a storm daily. Whole trunks of men are often killed. To a white man, they say there is no danger while he has a black at his side, the latter being the better conductor. When one is struck, another must be immediately substituted.'

### A LULLABY.

Rest thee! The daylight has gone from the valley,  
Night from the outward is gliding across,  
Dusky shadows lurk in each tree woven alley,  
Shrieks of wail rule on the night's dark domain.  
Rest thee, thou rest thee western winds sigh,  
Night voices chant Lullaby! Lullaby!

Rest thee! The lake murmurs faint in its dreaming,  
Stars like a child that has visions of joy,  
And Vision is radiance effulgent is beaming,  
Glimmers from night that thy rest would destroy.  
Rest thee, thou rest thee western winds sigh,  
Night voices chant Lullaby! Lullaby!

Rest thee! Sleep on till the gray dawn is stealing,  
And the star of the morning is fainting in light,  
Sleep till the mist arises, breaking and whealing,  
Flies from the hills with the going of night.  
Rest thee! till morning breaks western winds sigh,  
Night voices chant Lullaby! Lullaby!

## THE STEAM-HAMMER AND ITS INVENTOR.

IF it has ever been your pleasure and privilege to obtain permission to inspect one of our great iron-works or engineering establishments, you could not fail, in the midst of the mechanical wonders to be witnessed in these temples of industry, to have been struck with the operations of the steam-hammer. With what ease it works, and with what power! The great square hammer-block, weighing five or ten or twenty tons, perhaps more, and by which the rugged mass of white-hot iron is to be pounded into shape, is raised in its groove as quietly, as smoothly, and as lightly, as though it were only a feather's weight; yet when it comes down it strikes with a thud that shakes the ground beneath your feet, the shock suggesting to the startled onlooker some idea of the vibrations of an earthquake. And as the immense mass of glowing iron is turned on the great anvil beneath it, and blow succeeds to blow at the rate, if required, of eighty a minute, and the sparks and splashes of hot metal are sent hissing around, it might almost be thought that some Titanic agency had been set in motion, which no power of man would be able to control or bring to a stand. Yet, there! a signal is given, and the attendant's hand has touched a lever, and the great thing, whose force and fury were but now like the mighty struggles of some gigantic Prometheus in chains, suddenly pulls itself up, without noise or remonstrance, and stands as still as a statue. A thing of mighty power, yet more controllable than the tiniest child! Without its assistance, many of the most important operations of the worker in iron would be rendered impossible; an invention which has given a greater impetus to engineering skill and a wider scope to engineering possibilities than any other mechanical invention of the century.

We have now, under the title of *James Nasmyth, Engineer* (London: Murray), a memoir of the inventor of this wonderful steam-hammer, written

by himself, and published under the practised and graceful revising hand of Mr Samuel Smiles as editor. The volume is quite equal in interest to the Lives of Dick and Edward formerly written by Mr Smiles, and will probably, from the fact that engineering and mechanics are subjects of more general knowledge than natural history, command even greater public attention than was accorded to the very popular biographies just mentioned. Mr Nasmyth's autobiography is accompanied by a beautifully etched portrait of the author, with numerous woodcut illustrations relative to scenes, designs, and inventions referred to in the work.

Mr Nasmyth, who is still alive, was born in 1808, at his father's house, No. 47 York Place, Edinburgh. The name of Nasmyth or Nasmyth is an old one in Scotland, and has been long and honourably associated with the estate of Pomo in the county of Peebles. Some time in the fourteenth century a branch of the Nasmyths of Pomo is said to have settled near Hamilton in Lanarkshire, and from this source the subject of this memoir traces his descent. The history of the family in its later generations might be held as wonderfully exemplifying and illustrating the law of heredity in mental as in physical character. Mechanical and artistic ingenuity has formed a distinguishing feature in this branch of the Nasmyths for the last two hundred years. The first of these members of the family on record in whom this mechanical ingenuity displayed itself was a female. Her name was Elspeth Nasmyth. Unfortunately for her, she lived in times when the burning of witches was still thought a meritorious adjunct of judicial polity; and because this Elspeth had four black cats, and read her Bible with two pairs of spectacles, she was adjudged to be a witch, and cruelly condemned to be burned alive! The practice of reading with two pairs of spectacles shows, says her descendant, Mr Nasmyth, 'that she possessed the spirit of an experimental philosopher. She was in all respects scientifically correct. She increased the magnifying power of the glasses;

a practice which is preferable to single glasses of the same power, and which I myself often follow.

The Naemyths of Hamilton lost their property in that district by their adherence to the cause of the Covenanters, after which his family removed to Edinburgh, where Michael Naemyth, Mr Naemyth's great-grandfather, occupied a house in the Grassmarket. He was a builder and architect, and his chief employment was in designing and erecting new mansions, principally for the landed gentry and nobility. His high reputation as a builder caused him to be made choice of by the government in the beginning of last century to build a fort at Lavenham, in the heart of the Bob Roy country, to overawe and keep in check the wild Highlanders. The government, however, neglected their promise to maintain a suitable guard of soldiers over the workmen while the work was in progress, consequently, that occurred which might have been expected. One dark and snowy night in the winter of 1703, by which time the work had been well advanced, a loud knocking was heard at the door of the hut where Michael and his men slept. 'Who's there?' he asked. 'A beaughted traveller overtaken by the storm,' was the reply. Naemyth was induced to open the door, when he rushed Bob Roy and his gang. The workmen fled for their lives, and this was granted them, on condition that they should instantly depart, and take an oath that they should never venture within the H.C.'s border again. They were thereupon turned out in the snowstorm, with the recollection that the sufferings to which the builder, along with his men, was subjected as he rushed a piece of safety, brought on an illness from which he never recovered. 'One evening, whilst sitting at his bedside with his grandchild on his knee, a death-like faintness came over him, he set the child down carefully by the side of his chair, and then fell forward dead on his own hearth stone.'

The old mine business was carried on after him, first by his son, and then by his grandson, Mr Naemyth's grandfather, whose name also was Michael. Thus Michael succeeded to the business in 1761, and among other houses which he erected in Edinburgh were the principal number of those in George Square, including the house, No 25, in which Sir Walter Scott spent his boyhood and youth. They still exist, and bear testimony to the elegance and substantiality of the old builder's work.

At his death he left two sons, the younger of whom, Alexander, was the father of the subject of this autobiography. Alexander Naemyth—who was afterwards celebrated as a portrait painter, one of his best known works being the life-like portrait of Robert Burns, so often since copied and engraved—was in his youth apprenticed to a coach builder, where his artistic tastes were trained in the painting of the heraldic blazonry on the panels of the carriages. To improve himself as an artist, he attended in the evenings the Edinburgh Drawing Academy, at that time under the management of Alexander Bannerman. The stock of casts from the antique, and the number of drawings, were then very small, the consequence being that the pupils

had often to copy the same figure or drawing over and over again. To the more ardent pupils this was excessively irksome. On one occasion, Alexander Naemyth had completed, for the sixth time, a fine chalk drawing of 'The Lagoon,' and when it was set for him to copy again for the seventh time, he begged Mr Bannerman to give him another subject. The master, quick-tempered, at once said 'I'll give you another subject.' And turning the group of the Lagoon upside down, he added 'Now, then, copy that!' It was a severe test, but the patient youth set to work, and in a few evenings he had completed a perfect copy. Bannerman was so proud of the skill of his pupil, that he had the drawing mounted and framed, with a note of the circumstances under which it was produced.

The young artist was still following his trade of coach builder. But an important change was about to take place in his career. One day Allan Ramsay, the historical painter, son of the poet of the same name, calling at the coachworks, found Naemyth painting a coat of arms on the panel of a carriage. He was so much struck with the lad's artistic workmanship that he formed a strong desire to take him into his own service, and after some negotiations with Naemyth's mother, this was accomplished, and the youth consequently removed to London to work in Ramsay's studio. Here he remained for some years, returning to Edinburgh in 1778 in partnership as he was called the profession of portrait painter. It was in this capacity that he had the honour of Burns sitting to him for his portrait, and the poet likewise, during his visits to Edinburgh, spent much time in the company of the artist. But Naemyth was more than an artist. He had very high abilities as an architect and designed the Iron Bridge and other prominent structures in Edinburgh. He also worked as mechanical contrivances, and was the inventor of the 'bow and string' arch for bridges and roofs—a form of construction now generally adopted for the covering in of large spaces such as railway stations and the like. He was also frequently consulted by gentlemen as to the laying out of grounds in the vicinity of country mansions, and as one who had, moreover, great skill in works of practical engineering, he was present at the trial trip of the first steam vessel ever seen in this half of the world, which was built to the order of Mr Miller of Dalhousie, the landlord of Burns when in Edinburgh farm, the poet being on board the small steamer, along with Naemyth and others, on the occasion of the trial trip referred to, on Dalhousie Loch.

An instance of what the autobiographer calls his father's 'faculty of resourcefulness,' two anecdotes may be given. When in London, as Ramsay's assistant, he had arranged to go with a sweetheart to Ranelagh, then one of the most fashionable places of public amusement. Everybody went in full dress, the bucks and swells wearing long striped silk stockings. The young artist had only one pair, which he himself washed for the occasion, but unfortunately in drying them at the fire, he allowed them to be so singed and burned as to be totally useless. What was he to do? In this dilemma the happy thought occurred to him of painting his legs so as

to resemble stockings. He got his water colour box, and proceeded dexterously to paint them with black and white stripes, and when the paint dried, which it soon did, he completed his toilet, met his sweetheart, and went to Ranelagh. No one observed the difference, except, indeed, that he was complimented on the perfection of his fit, and was asked 'what he bought his stockings?' Such questions of course he evaded, and left the gardens without any one discovering his artistic trick.

Again, later on in life, the Duke of Athole consulted him, on account of his skill in landscape gardening, as to certain improvements which that nobleman desired to make in his woodland scenery near Dunkeld. There was a rocky crag, called Crugbharran, which the Duke wished to have planted with trees, to relieve the grim barrenness of its appearance, but it was impossible for any man to climb the crag in order to set seeds or plants in the clefts of the rock. 'A happy idea,' says the autobiographer, 'struck my father. Having, observed in front of the castle a pair of small cannon used for firing salutes on great days, it occurred to him to turn them to account. His object was to deposit the seed of the various trees amongst the soil in the clefts of the crag. A tinsmith in the village was ordered to make a number of canisters with covers. The canisters were filled with all sorts of suitable tree seeds. The cannon was loaded, and the canisters were fired up against the high face of the rock. They burst and scattered the seed in all directions. Some years after, when my father revisited the place, he was delighted to find that his scheme of planting, by artillery had proved completely successful, for the trees were flourishing luxuriantly in all the recesses of the cliff.'

The inventive genius—the 'faculty of resourcefulness,' as our author happily phrases it—which distinguished Nasmyth the artist is found still more highly developed in his son, Nasmyth the engineer. The story of the latter's career as told in this volume has a charm which can only be reckoned second in respect of power to the interest produced by reading a first class novel. The events of his early years—his boyhood, his education, his friends, his arguments, and what is of still more importance, his juvenile mechanical experiments—can only be briefly alluded to here. In his father's house, he had the advantage of a workroom in which were lathes and other tools of various kinds, the elder Nasmyth being always in his leisure hours engaged in some work or other more or less mechanical. The boy, moreover, on school holidays, and at every other opportunity, was in the habit of frequenting foundries and engineers' workshops, his mind being from very early years wholly engrossed in such pursuits.

When only between ten and twelve years of age, he could see his father's turning lathe so efficiently as to make spinning tops, or 'poornies' as Scotch lads call them, which poornies were so much superior to those sold in the shops, especially for their ability to 'sleep'—that is, to spin round without a particle of wobble—that young Nasmyth had a rapid demand for them among his fellow pupils at the High School. He was likewise famous among them for the kites which he constructed, as well as for his ability to transfigure old door-

keys into pistols, which were used with shouts of merriment on the king's birthday. He also at this time manufactured small brass cannon for similar purposes, which he cast and bored himself, even mounting them on their appropriate gun-carriages. A workman having shown him how to perform what he calls 'the most important of all technical processes in practical mechanism'—the art of hardening and tempering steel—he likewise added this to his trade resources among his school companions, for out of old files he could forge beautiful little 'steels'—made use of to procure fire from flint before the days of lucifer matches—and these were in great request. The percent of a fine new steel was also occasionally skilfully used by the maker of it, as a gift to his recorder, for the purpose of getting rid of some school task at which he might not be half so expert as at forging and hammering. He admits that this system of bribery and corruption was 'shockingly improper,' but he adds that nevertheless it continued to be one of his 'diplomatic tricks' till he left school.

At twelve years of age he left the High School, but continued his study of arithmetic, geometry, and mathematics at private classes. Under his father, also, he practised drawing till he attained great proficiency. But it was in his father's workshop that he was busiest. There he gradually became initiated into every variety of mechanical and chemical manipulation. As far as lay in his power, he made his own tools, and constructed his own chemical apparatus. He also had opportunities of mental improvement in listening to the conversation of his father's friends, such men as Sir James Hall, Professor Leslie, Dr Brewster, and others, and he was occasionally privileged to join them in their walks, when their discussion of geological and other natural subjects greatly interested him. His life was further diversified by his being at times allowed to accompany his father on journeys through the country, the latter having in his later years devoted himself more to landscape than portrait painting.

Thus his life went on till he reached the age of seventeen. He was by this time very expert in mechanical work, and now set himself to construct a small working steam engine for the purpose of grinding the oil colours used by his father in his artistic work, and the result was quite satisfactory. He also made from time to time five models of a complete condensing steam-engine, each model showing, on one side the exterior parts of an engine, and on the other or sectional side the whole details of the interior, even in full action when the fly wheel was turned by the hand. For these models he received ten pounds each, the first being bought for the use of the students in the Edinburgh School of Arts. He worked at them during the day at his father's lathe, and at night he did the castings up steam in his bedroom—as odd a place for a brass foundry as can well be conceived. When he was nineteen years of age he made a small working model of a steam carriage for road, which he exhibited before the members of the Scottish Society of Arts, whereupon they offered him sixty pounds to construct a machine from the model such as would carry four or six persons. This he did; and many successful trials were made with it,

the carriage being large enough to seat and carry eight passengers.

We cannot follow all his experiments and achievements in detail, but in 1839 he went to London, where he was fortunate enough, through means of the models and working drawings which he took with him, to receive employment under the famous engineer, Henry Maudslay, as his private assistant. This is one of the most interesting portions of the book, but would take too much space to tell here. Sufficient to say that he obtained employment, at a wage which he was content to ask and receive, of ten shillings a week. Determining to make this sum serve for all purposes of lodgings, food, and clothing, he found it could not be done if he was to dine at eating houses, he therefore drew a plan of a tin oven, which he got a tinmith to make for him, and this tin oven, which was heated by a small oil lamp set beneath it, served to cook a good dinner for him every day at a price of fourpence halfpenny. He practised it skill, and after a lapse of more than fifty years it was found, when tried, to cook as sweet a mouthful as ever.

Two years afterwards, and in consequence of Mr Maudslay's death, young Newmyth began to think of commencing business for himself, but he had no capital beyond what he had received for models of engines, and the bit, which he had made. He resolved, however, to make a start at Manchester, and though his belongings were small, yet the class of work he produced, his ingenuity in planning tools, and his expedients to lessen the labour and perfect the results, soon attracted attention, and he rose from more to more till in a few years he built for himself new works on a bit of land at Patricroft, near Manchester, which works have since been known far and wide as the Bridgewater foundry.

It was here, in 1839, that he conceived his great invention. Mr Humphries, engineer of the Great Western Steamship Company, had come to consult the young Scotch engineer, Patrickroft, as to certain machine tools, of unusual size and power, required for the construction of a pair of immense engines for a proposed new ship. The tools were made by Mr Newmyth and delivered to the satisfaction of Mr Humphries, and the construction of the gigantic engines was soon in full progress. At length, however, unexpected difficulties arose. An enormous wrought iron paddle shaft, larger than had ever hitherto been forged, was required, but all the largest firms throughout the country, when asked to estimate for the work, answered, to Mr Humphries' surprise and dismay, that they were unable to undertake so large a forging. In this dilemma, he wrote to Mr Newmyth, saying, 'What am I to do? Do you think I might dare to use cast iron?'

'This letter,' says Mr Newmyth, 'immediately set me to thinking. How was it that the existing hammers were incapable of forging a wrought iron shaft of thirty inches diameter? Simply because of their want of compass, of range and fall, as well as their want of power of blow. The obvious remedy was to contrive some method by which a ponderous block of iron should be lifted to a sufficient height above the object on which it was to strike a blow, and then to let the block fall down upon the forging, guiding it, as its

descent by such simple means as should give the

generally thought out, with the aid of pen and pencil, such mechanical adaptations as I had conceived in my mind, and was then by enabled to render them visible. I then rapidly sketched out my Steam Hammer, having it all clearly before me in my mind's eye. In little more than half an hour after receiving Mr Humphries' letter narrating his unlooked-for difficulty, I had the whole contrivance, in all its essential details, before me in a page of my Scheme Book.'

Such was the origin of the steam hammer. But though Mr Humphries highly approved of the design, the steam hammer was not then made, as about that time the use of the screw as a propeller came into notice, and the required paddle engines were therefore departed from, and the ship of course along with them. It was not till April 1843 that Newmyth saw his invention in actual shape, and this was in France. He was inspecting a large engineering establishment at Creusot, under the guidance of one of the partners, when he was particularly struck with the excellence of a large wrought iron marine engine single crank. 'How,' he inquired, 'has that crank been forged?' To his astonishment, the reply was 'It was forged by your steam hammer.'

His pleasure was as great as his surprise at hearing this statement, and in answer to further questions, the Frenchman told him that he had visited Bridgewater foundry some time before, when Mr Newmyth himself happened to be absent. The latter partner, however, had received the French engineer, shown him the works, and, as was their habit, shown him also the designs entered in Mr Newmyth's Scheme Book. By permission, the Frenchman took notes and drawings of the steam hammer design, went home, and thereupon constructed the one which its inventor had now the intense gratification of seeing at work.

On Mr Newmyth's return to England, he presented the steam hammer, and shortly afterwards made one for himself of thirty hundred weight of hammer block. The valuable qualities of the hammer soon became known, and there was no want of orders. In 1847 the Admiralty ordered one of two and a half ton hammer block and on the day when its erection was completed at Devonport, the Lords of the Admiralty came to see it. 'I was there,' says its inventor, 'with the two mechanics I had brought with me from Patricroft, to erect the steam hammer. I took share and share alike in the work. The Lords were introduced to me, and I proceeded to show them the hammer. I pressed it through its parts. I made it break an egg-shell in a waste jaw without injuring the glass. It was as neatly effected by the two and a half ton hammer as if it had been done by an egg-spoon. Then I had a great mass of white-hot iron swung out of the furnace by a crane and placed upon the anvil block. Down came the hammer on it with ponderous blows. My Lords watched, and flew to the extremities of the workshop, for the splashes and sparks of hot metal flew about. I went on with the

hustling, blows of the hammer, and kneaded the mass of iron as if it had been clay. Then Lordships honoured him with their careful attention as he afterwards explained the details of its working and construction, and expressed their admiration at the hammer's wonderful range of power and delicacy of touch, and the controllable application of the force of steam.

Thus was not the last, though the greatest, of Mr. Naemyth's numerous inventions, but for the further story of his life, we must refer our readers to the book. In this autobiography we are furnished with another example of how good parts rightly and steadily directed to a given end may not only achieve the object aimed at, but in addition may secure some other and much more important and valuable than had ever previously been thought of or hoped for.

## ONE FALSE, BOTH FAIR,

OR, A HARD KNOT

CHAPTER XI.—IN KENSINGTON GARDENS.

ONCE, twice, thrice she read the letter—she mistook it of *Charles Vane and Laurence Howe*, carefully, slowly, she read over every line and syllable of the mysterious note which had been hunkled to her by the groom of the chamber—she had an excellent memory, and, from the first, the words she read had, as it were, burned themselves into her brain, so that they could never be forgotten; yet she read them attentively again and again. It was a slender little letter, highly perfumed, sealed with a big seal, on which was the impression of a countess—a foreign coronet. Foreign, too, were the wax, the envelope, the glossy paper, and the tannaceous, musky scent that clung to all, like a weighty atmosphere of incense. The note was couched in the French language. No misapprehension on a free translation.

DR. MARIOT THE MARCHOVENS—I am in town. You are in town. That says all. We shall meet, and advise ourselves in friendly, if too candid, recollections of the past, of communings and hours spent together among the Pyramids and Painted Galleries of Luxor, or beneath the withered palm-trees of the Desert. Do not be surprised that I know so well your more recent events. No demon has manifested for me your lordly chatelaine—I pine to see it, but, alas! our day-dreams are rarely gratified—of *Castel*—I tremble as I write the barbarous word—*Castel Vane*. But the English newspapers, so loyal to your illustrious aristocracy, keep us poor foreigners as constant as to the dates of your arrivals and departures. Do you know, in Kensington Gardens, a group of elm trees great and ancient, on a sort of sandy mound, where few are to be seen but naturalists and little children, and a few scarlet warriors of your Queen's Guard? There, from five to day, I shall await your coming in all confidence. You will not fail me—Yours, in affectionate regard,

LOUISE DE LALOUVE

Very carefully, if very quickly, the young lady concluded the third perusal of the letter, and then she carefully refolded it, glanced at the

sentimental clock over the chimney piece, and compared the tale it told with that of her own watch, and then she seemed to form a quick mental calculation as to time. Lady Bubara was gone, fairly gone. The large barouche, with the strawberry leaves adorning the coronet on its privileged panels, had rolled off into the hum and stir of the streets and the Park, all alive with the pleasure-making life of mighty London. Now was the time to sit. Cursing up the letter in her mind, she rose from her silken seat and glided away upstairs. Our British aristocracy has this advantage over the rival nobility of Russia, that its members can traverse their own halls and abbeys and castles without encountering, save accidentally, the unwelcome scrutiny of prying eyes. In Russia, a great lady, Princess or Countess, is attended by many servants, who seem to sleep or keep vigil out in her chamber door, like disciplined sentries at their post, and who see from their cushion benches to bow, and answer, 'Your Excellency—*batoucha*, whenever the noble mistress of the mansion goes by. When she of Leominster went up the broad marble stairs to her own room, she met nobody, and she dressed herself, as she had often done in humbler days, rapidly, and without requiring the services of the handmaids that she might have summoned by laying her finger on the bell. In a few minutes, dressed in mourning weeds, and closely veiled, the young mistress of the mansion glided down the palatial stairs, threaded the spacious corridors, passed through the huge marble hall, and was soon outside, and hunkled, alone and on foot, into the roaring current of London life.

CHAR. CAREW and her sister CORA, reared far off in remote Devon, had had very little experience of our modern Babylon, the Great. A rare pup at the metropolis was all that could be looked for by the children of a steady Devonshire house, and it was wonderful that this young girl proved her knowledge of western London as she did. But the art of finding one's way comes by nature. Some of us may blunder, untroubled, for ever, among lanes and streets, where others cut off as if by magic the exact route to be followed. The lady we write of was of the latter variety. Shunning the more crowded thoroughfares, avoiding observation, so far as it was possible to avoid it, she soon reached Kensington Gardens.

Then, on a sandy mound, soared aloft the giant elm—yet old tree, that had perhaps seen Oliver Cromwell's unknown carrier round the Military Park of the Commonwealth, and that had certainly looked down on Sir John Trenchard and the luckless Duke of Monmouth as they ruffled it among the blood and confusion of a later day. Under those trees, in a knoll a little apart, stood a tall, spare, graceful, erect, no other than that of Louise, Countess de Lalouve. That lady came forward, and with a gracious inclination of her head that would have done honour to a royal nuptial, held out a large hand, the glove white, man-buttooned, of supple kid, fitted exquisitely well. 'My dear Maryana.' was all she said, but she managed, as Frenchwomen and Russians can, to put an expression into the words that suggested much.

'You wrote to me, dear Countess,' said the other hurriedly, but replying in the same language as that in which her former acquaintance had begun the conversation, 'and you see I am here.'

'How readily you speak French, dearer,' returned the Sphinx, with what seemed sincere commendation. 'You accent, without beautiful ones, you learned from me, but your pretty grammar, that is quite your own, really, it would satisfy the *Panbourg*; *le Germain*. Most of your countrywomen speak a jargon, believing it to be French of Paris, which— But never mind.' Is it not true that we two should understand each other?'

There was a pause. The foreign Madame surveyed the English lady with great dark burning eyes. The blue eyes of her whom she addressed were turned earthwards. Presently they looked up, and frankly confronted those of the foreign lady of title. 'That you mean well and kindly, dear good Madame de Lalouve, I am very certain, she said, 'that you know I am in trouble, I can guess too. My sorrow springs from a very unexpected quarter. My dear, dear sister!—and here she had her face, but went on, after a pause—'my own loved Cora, has been lurid away by the glitter of wealth and rank, till she has forgotten her twin sister's love, forgotten honour and truth, and—'and—Countess, how can I tell you—at the moment of our arrival at my late husband's house, at Castel Vawr, she—'

'Ah! what did she do?' asked the *Bonno* Frenchwoman, with keen curiosity and a flick of her black eyes.

'She claimed to be—'gasped out the speaker—'to be, not Cora, but Clara—poor Wilfrid's wife—the Marchioness of Leconminster, and no tears, no prayers, no reasonings could make her swerve from the wicked obstinacy of her assertion.'

'It was monstrous,' said Countess Louise, never removing her fiery eyes from the beautiful blanched face on which they looked. 'What? the Lady Barbara was there, and the notary—family lawyer—and—'

'How, you know it?' asked the other, surprised.

'I know most things. I am the Sphinx, am I not?' returned the foreign lady, with one of her meaning nods. 'Never think, My Lady Leconminster, that you are alone, unseen. You great English folks live in houses of glass.' She fixed out them last words with passionate, brilliant earnestness, and indeed, as she towered over the small fair haired girl, she looked much like one of the great serpents of India, up reared, with horrid head and menacing eyes, ready to strike.

But she whom she thus seemed to menace merely answered. 'Do you know, dear Countess, that even before your note reached me, I had been wondering, how I could seek you out—how I could see you, and talk with you, and induce you, if you only would, to use your influence, so good, I know, over my poor lost sister Cora.'

'Over your—poor—lost—sister—Cora?' repeated the foreigner, with cruel emphasis. 'Bon! Miledi the Marquis, why, with all your grand friends around you, with Lady Barbara, so sympathetic,

at your side, have recourse to me—to me, a poor stranger here in your lovely London, and suspected, as all of us are who are not of insular birth, as if we were refugees in dread of the police—why come to me, when it is a question of Mademoiselle Cora, your sister?'

'Because,' pleaded the other, 'you were so unselfish, together, dear Madame de Lalouve, and when I was beside my poor Wilfrid, acquired her confidence and her admiration, as you did, far off in Egypt. Because you are so clever. Because Cora would hearken to you, and—'

'You are clever too—very clever,' muttered the foreign Countess, with a flash of her burning eyes and a lifting of her expressive shoulders.

'Do help me, dear Countess Louise, dear friend, do try to get Cora to give up this mad girlish fancy, which has led her to wreck the happiness of both, for a mere dream,' said Clara imploringly. 'Advise her, urge her to be true to me, true to herself, to come back to me, and trust her future to me, and indeed—Countess—the dear girl should never know an instant of reproach or blame. I myself should be the first to shield her—from—' And here she was foud to conceal her emotion.

'Upon my word,' exclaimed Madame de Lalouve, with what seemed a genuine ring of approbation in her voice, 'you are a very remarkable—young lady. I had my own notions of Englishwomen, but— Never mind! Do you know what your sister has done to you?'

'She—tried—'

'Tried to rob you of name, wealth, title, identity—a robbery most base, heinous, cruel, and deliberate, said Madame de Lalouve severely, 'and thus to you, unoffending—to you, her twin sister, and you would forgive her, and you would have me use my influence, if I have any, to bring her back—What should I be myself the better for that?' She asked thus so abruptly that the compression of her thin lips resembled the sudden snap of a rubber strap.

'I should be so grateful!' murmured the other faintly.

'I have lived long enough to know what an idle word is gratitude,' retorted the foreign lady bitterly. 'Those who have climbed, kick and the marcher as no longer needed. Why should I care whether one sister or another wins in an affair which would have been settled of old by

What,

fact, have I to gain by it?'

The question was barely put. It was steadily answered.

'Much,' answered the girl, looking into the fiery eyes of her Egyptian acquaintance with eyes that were able to meet her own with equal courage, as if the light of truth shone in them—'much.' My gold—and I have much of it, I believe—in dress to me, compared with a sister's love. I am rich, they tell me. My gratitude, Madame, shall be solid and substantial, if only you will help me to get back my lost darling, to persuade poor Cora that—'

'Comrade! Your hand upon it!' cried the *Bonno* Frenchwoman, suddenly stretching out her own. 'Come, let us be frank, *mon amie*. We ought to understand each other.'

'I think we do,' answered the other, and again their eyes met. 'This is my brother's address in Bruton Street,' she added hastily, as she pressed a piece of written paper into her friend's hand, 'there you will find poor Cora. Use your influence, be her good angel, in a word, and when you have news, we will meet again. Now, as you understand, I must hurry back. Adieu!'

'Adieu! You are worthy to be Lady Leominster,' muttered the swarthy Countess as they parted.

Half an hour afterwards, the beautiful mistress of Leominster House, divested of her walking attire, was again sitting, half crouched, in her low arm chair, when Lady Barbara's carriage creased, and that stately she-dragon of aristocracy sailed into the room, not in the best of tempers.

'Shall I tell you, my dear?' she said. 'I think, if you had come with me, it would have been pleasant.'

'Perhaps,' said the girl, smiling. 'I am certain of it,' said Lady Barbara doctorally. 'The few old friends she had called on had been from home, she had seen no one in the Park worth bowing to; the frivolity of the younger generation had revolted her, as it always did. She had come back even more out of temper than when she sailed forth. Then came the tea-drinking, the long evening, the late dinner, solemn, stately, and which went on almost in dumb show, so slight was the conversation at that sumptuous board.'

'You never told me, Clara, love, who was your mysterious correspondent?' said Lady Barbara, with a clumsy solicitation of playfulness, before they went to bed. But the other coldly made answer that it was a mere nothing—a note from a lady whom she had known abroad, and who happened to be passing through London, and then Lady Barbara felt that she had neither the right nor the power to pursue the subject further.

## ROYAL CHILDREN

MANY a boy must have thought that he should like to be a Royal Prince, many a little girl must have imagined that it would be delicious to be a Princess. Royal children are not, however, except in England, a very happy race. One must make a distinct exception in favour of the little people belonging to our English royal family, because, whenever they are seen in public, their healthy, happy faces indicate clearly enough that they have no cares on their minds. They have not been appointed to commandments of regiments in their cradles, grand ordons have not been hung round their necks before they could toddle, when they go out with their governesses and nurses, there are no armed escorts to protect their lives, and to make them ascend, if not precociously nervous. Imagine what the life of a Russian child-prince must be at the moment. Parents threatened daily with assassination, may grow callous so far as they themselves are concerned, but they cannot for a moment diminish anxiety about their children. The dread lest harm should befall these little ones has retroactively led to the taking of such precautions that the

Czar's children must play in the midst of a very circle of drawn swords and loaded firearms, and what is worse, they must see on the faces of all around them such an expression of uneasiness, that if they be impressionable, as children usually are, there is a danger that their minds will early acquire a chronic tinge of melancholy.

Even in the days before nihilism had commenced its dastardly outrages, the children of the Russian imperial family were guarded in a way that must have seemed very irksome to them. It was no uncommon thing in St Petersburg to see a whole troop of light horse in full trot along the Newsky Prospect, to escort three carriages containing a couple of imperial children and their suite, and on the birth-day of an imperial child, it frequently amused foreigners to see a baby in swaddling clothes solemnly borne by a drum major at the head of the regiment which the little mate was supposed to command. Getting thus early familiarised with court pomp, the children became preternaturally grave. It was a wonder to observe how coolly they bore themselves in public, and how extremely attentive they were to acknowledge every mark of courtesy shown them. But indeed this punctilious observance of the laws of etiquette is one of the first things taught to the young members of reigning families in all countries.

Ordinary children who envy the lot of Princes and Princesses, may console themselves with the reflection, that these favoured young mortals have a terrible number of things to learn. The curriculum of a Prince's studies would dismay any public schoolboy. Very little time is left him for play, and still less for that solitary loafing about and meditation in which most boys delight. If he disappeared for a couple of hours to go on some frolicsome expedition by himself, he would rouse an alarm throughout the palace where he resided, and possibly cause his governor or tutor to be flogged.

The late Prince Imperial of France when he was ten years old once walked out of the Tuileries for a ramble in the streets, having been seized suddenly with an irresistible temptation to go and join some boys whom he had seen snow-balling. He returned after an absence of four hours, but in the meantime a hundred detectives had been scouring Paris for him, and he found his parents almost frantic with terror. The little King of Rome, Napoleon I's son, once wanted to play truant in the same way, but was checked in time. He then declared, with much weeping, that he wanted to go and make mud-pies with some dirty boys who were playing on one of the quays of the Seine. Young Princes of course have their hours of recreation, but it is often much of the same kind as that of which Sandford and Merton partook in the company of their tutor Mr Barlow. Charles Dickens, in one of his Uncommercial Samples, has ridiculed the terrible propensity of Mr Barlow to improve every minute of the day by casual sermons, but this is really the kind of thing with which young Princes have to put up constantly. The eloquent Fénelon, who was tutor to Louis XIV's grandson, the Duke of Burgundy, was an actual living prototype of Mr Barlow. He composed *Mémoires* for his pupil's edification, and was probably the inventor of what we now call object-lessons. There are

excellent, most interesting things when taken in school time, but little Princes and Princesses may be pardoned for finding them rather irksome when inflicted on them during all their walks. It is said that Louis II, the present king of Bavaria, took an utter disgust in his boyhood to history and politics, through the indomitable zeal of a Professor who discoursed on these subjects in season and out of season. He would cry, pointing to a haystack, 'Can you give what is the height of that?' 'Thirty feet,' perhaps, the boy would answer—'Well, does the number thirty remind you of anything?' 'Well, there not thirty knights on both sides at the Combat des Trentes?' 'Well, there not thirty virgins at Athens?' 'Well, there not a Thirty Years' War?' And so on, till poor little Prince Louis lost all pleasure in the sight of haystacks.

Napoleon III's hair was also sorely taxed by a couple of most accomplished but too earnest tutors, General Frossard and M. Monnier. One day he had been sent out to see a villa on the Rhine. 'Well, what have you been doing?' and his father, when he returned home. 'Oh, we have been talking of tricaracs,' said the boy wearily, 'and I have heard the story of Darius over again.' The Prince Imperial, however, was quite intelligent enough to understand that in two days the hair apparent to a throne must not be a dance, and he was perhaps one of the most amiable pupils any court tutor ever had. Comparing notes with the young Prince of Asturias, now king of Spain, he one day asked the latter what he won he found it hardest to learn. 'It is, not to laugh in the theatre when I am unwell, and the future king of Spain humbly. 'They let me laugh as much as I like,' said the Prince Imperial, 'but what I don't like is to be obliged to smile and look pleasant to men who I know are my father's enemies.' He was alluding, then, to Count Bismarck, who had come on a visit to Napoleon III at Fontainebleau, and had been received with a cordiality which the boy knew to be more apparent than real.

It is a custom in the Prussian royal family that every Prince shall be apprenticed to a trade, in order that he might be able to earn his living in case of a revolution. The present Crown Prince was taught watchmaking, but whether he could obtain the wages of a skilled journeyman, if his father's crown failed him, is another question. During the first French Revolution, the Duke of Orleans, who afterwards became 'King of the French' by the title of Louis Philippe, had for a time to earn his living as a schoolmaster in Switzerland. Doubtless most German Princes in three times would be able to do the same, for they are all capital linguists and arithmeticians, besides being uncommonly expert in horsemanship, fencing, and drill.

It may be remarked of the smaller German courts, that etiquette is studied and practised there in a very serious fashion. There is possibly in Grand Ducal nurseries a handy book with some such title as 'The Thirty six Different Methods of Bowing and Courtesying,' for it is certain that the little Princes and Princesses are cleverly taught how to graduate their salutations in nice shades to suit different categories of people. If only a little occasional jollity were allowed to relieve the tedium of these lessons in smiling

and posturing, the lot of a young Prince might still be regarded as a pleasant one, but by all accounts, it seems that some of the German Princes are brought up with a military strictness that would have commanded itself to the approval of a Spartan. The king of Bavaria, when Crown Prince was made to live on beef and mutton, and his portion of the latter food was never allowed to exceed one mutton chop. It is related that on the day when he became king, his first act of royal prerogative was to say to his equerry, 'I mean to have two chops this morning.'

## THE MAN IN POSSESSION

IN TWO CHAPTERS.—CHAPTER III.

As I sat for a moment after my discomfiture, the singular construction of the roofs, as they appeared to me on my first view of them, recurred to me. 'The very thing!' I said to myself. 'It will be very odd if I don't manage to get into this house again.'

With me to resolve was to act, and I immediately divided into the shrubbery, in order to work my way quietly and unobserved to the back of the premises. It was well that I did so, for scarcely was I concealed by the foliage, when the front door was again opened, and George Wintock and Benetta—the former bearing a light—stepped out upon the gravel walk, and commenced making a circuit of the premises. Holding my breath, and crawling upon hands and knees into deeper shade, I contrived to avoid them. At length, apparently satisfied, after their scrutiny, that I had made off, they retired into the house. I overheard enough of their conversation, however, to inform me that it was Benetta's hand which had struck me to the earth.

I watched the window of George Wintock's bedroom till I saw by its shadow on the window blind that he had entered. After a while, the light was extinguished, and I concluded that he had retired to rest. I knew that he, his father, and the Italian went heavy sleepers, as they were accustomed to indulge in deep potations at night. How it came about that Benetta had discovered and frustrated my scheme, I never was able to fathom.

Having reached that part of the premises which I judged most convenient for my attempt—a low outhouse, used as a woodhouse—I lost no time in cautiously climbing on to its roof, which I was able to do very easily, as its lowest edge was not more than seven feet from the ground. Fortunately, none of the rooms in which the inmates slept looked out upon that particular angle, so that I did not much fear detection, if I could only make progress noiselessly, and attain the higher roof before daylight. I could then hide behind its high parapet. Dark as was the night, or rather morning, it was sufficiently light for me to see what I was about. Slowly and with some difficulty, I dragged myself from roof to roof till I reached a stack of chimneys that rose up by side a few feet from the parapet, and which had been belted with an iron girdle, and fastened with thick iron

rods to the wall just below it. By the aid of the rods, I managed to reach the parapet just as the dawn began to break. Here I was compelled, from sheer exhaustion, to lie down a short time and rest in the leaden gutter made. Truly, I was but in a sorry plight—my apparel soiled from crawling in the shrubbery, and from them bearing over the dirty roof, and saturated with the blood that had flowed freely from the blow I had received. I began also to feel extremely faint from exertion, loss of blood, and excitement. What would become of me, if strength failed me? I might lie and die and rot on the summit of this old mansion, before any one discovered me. Yet not for one moment did a thought cross my mind of showing the white feather and giving up the adventure, my feelings were indeed too overwrought for this, partly by an almost blind infatuation for the hapless Mrs. Wintlock, and partly by that longing desire to retaliate, which, whether rightly or wrongly, is generally felt by any one who has been put *hors de combat* at an unfair advantage.

A little rest and the cool fresh morning air somewhat revived me, and I commenced creeping along the gutter. With my pocket knife I loosened the leaden frame of a pane in one of the gabled windows and crawled the *plum*, meeting my aim, I was able to undo the catch and obtain ingress. Finding the coast clear, I glided softly down to my room, locked myself up, bathed my head and face, and taking a pull at my flask of excitement, I had my. If down which to rest my weary bones in at night, had I was much bruised, yet could not help inwardly chuckling at the surprise the Wintlocks and their worthy conjugal would experience during the course of the day, when they found that, in spite of his summary rejection, Jack Meredith was once more the Man in Possession.

And just indeed was the consternation of Beulah, when, on waking, she awoke and feeling urgent need of refreshment, I walked down into the kitchen where she and Martha were sitting at dinner. Neither heard me approach, as I purposefully trod softly. Martha had just helped the Italian to a slice of mutton, when, slipping in, I coolly took a chair and acted myself at the table. Both of them started and stared as if I had been a ghost.

'Very fine joint of mutton, indeed, Martha—capital! and so delightfully cooked—not over done. I should so like a taste just where it's so nicely browned on the under side,' pointing to it. 'Ah! you haven't a third plate. Never mind, I'll reach you one,' and I accordingly rose and handed her one from the dresser. The Italian muttered something in his own language, which if translated would, I suspect, have been anything but complimentary. 'Extremely happy to see me at your social meal, no doubt you are, friend Beulah! I reciprocate the sentiment most warmly. Here's to your very good health!'—taking up the ale jug from the table and filling myself a glass—'Admirable! Right good stuff!—smacking my lips—'Pay, Martha, don't let the mutton get cold,' seeing that she had not complied with my request. 'There's nothing in the world I dislike so much as cold mutton.'

I could see that both were for the moment thunderstruck; and as I took up my plate and

held it imploringly, Martha proceeded to cut me the coveted slice.

'Now, a couple of potatoes and a few greens, with just a dash of gravy—Thank you, Martha. You are a good soul! I think, in future I will always take my meals with you and Benetti, instead of giving you the trouble of waiting upon me upstairs. It will give you a great many steps, and be so much more comfortable for us all for it's rather lonely sitting up there by one's self so much.'

My companions were at first disposed to be rather glum, but seeing that I was determined to be on good terms with myself and them, they at last gave in, and we conversed amicably, though reservedly. I could see, however, by their occasional glances at my physiognomy, that both, and especially the Italian, derived considerable gratification in noting how severely I had been punished.

Acting up to my promise, I did not, during the remainder of the time I stayed at Bristol, Hall, trouble Martha to wait up on me, having one object in view, namely, the discovery of Miss Wintlock's whereabouts. I did not think it probable that she still occupied the same room above my sleeping apartment, or she would have devised some method of giving me at least a hint of it. Early next day I was in my old post, the window. In an hour I hummed and whistled away time I was accustomed with. In vain I looked up to catch some slight token of her presence. I felt that she was not there. She knew her case to be desperate, and if the window were fastened, failing other means, would doubtless have shattered a pane of glass as a signal. Yet was I convinced that she was confined somewhere in the upper part of the mansion, and for the following reason. Early, when I started to go up into the lumber room on the following morning, after I had closed my second entrance, I found the door at the top of the staircase locked, thus precluding all communication with the upper suite of apartments except by the back or servants' staircase. It was not so on the previous morning, when the inmates thought me safely shut out, as I had passed through it on getting down to my chamber. Hence there must be a motive for endeavouring to prevent me exploring them. How I wished that I had made the circuit of the roof, and peeped into every attic through its window, before descending to my own room, and yet I felt that perhaps I had acted for the best, as my strength would not have held out much longer. Secondly, I took occasion to observe this old Martha, when she thought herself unperceived, often put aside some of the best portions of her vessel, as if for some other person. With these she would suddenly disappear, but always in the evening. I endeavored to ascertain that she invariably made for the back staircase, and arranged my plan, desperate as it was, accordingly. It was destined to be put into execution much earlier than I had anticipated.

The fifth morning, after my clamber over the roof, Mr. Wintlock sent for me into his room. As I entered, I fancied that a smile of suppressed triumph flashed his countenance. Addressing me in a grandiloquent, sneering style, he said: 'Good morning, Mr. Meredith. I am sorry that your stay at Bristol, Hall has

been so protracted. But what cannot be helped, must be endured. I have been able to arrange my little affair with your principal, and consequently your presence here can now be dispensed with. I shall be glad if you will leave the premises at once.

Taken aback, I was at a loss for a moment or two for words to answer, as, from what I had heard previous to my coming to Brackley, I had not the remotest idea that Mr Wintock would be able to liquidate the heavy demand upon him. Had Miss Wintock at last thoroughly crushed and broken in spirit, decided to one of her propositions, and either consented to become the bride of his son, or at least some document which gave him absolute power over her property? The thought was horrible. Yet it might be so, for as I had not been able to effect any communication with her since that unfortunate night, her energies, physical and mental, might have collapsed in despair.

Mr Wintock, seeing that I was dumfounded, at once followed up his advantage. 'I wish to make one observation before you go. You have introduced most unwarrantably and unpardonably in the domestic arrangements of my family since you have been in the house, both in intruding yourself upon the privacy of a young lady resident here, and in endeavouring to intimidate her (except from her natural guardians). Possibly, you may not be aware that the young lady in question is a dangerous lunatic, and that a degree of wholesome restraint is absolutely necessary for her well-being and safety, though at times she may have apparently lucid intervals. I have no doubt you were misled by the craft peculiar to that affliction; hence, I am disposed to make due allowance for your extraordinary conduct. Otherwise, I should feel justified in communicating the circumstances to your employer, which would probably result in no very agreeable consequences to yourself. I say all for your satisfaction, that the young lady will shortly be placed in a suitable establishment, where she will be properly cared for. I hope, however, as you are a young man, that a due consideration of the extremely absurd manner in which you have acted, and the slight in consequence you have suffered'—here, with a blind smile, he passed his hand significantly over the upper part of his face—'may prove a warning to you to conduct yourself more discreetly in future.' He looked me full in the face and waved his hand towards the door.

How I repressed the fierce tempest of passion that inwardly shook me, I cannot tell. 'Sir,' I replied as calmly as I was able, 'I am not in a position to doubt your word, but—'

'But what?' he eagerly demanded. 'I tell you, man, that I posted a cheque for the amount last evening, and that I expect a discharge and receipt by to-morrow's post. Will that satisfy you?'

'Then no doubt, sir, the same post will bring me from my principal the usual release, without which I am not justified in deserting; my post immediately upon its arrival, I will comply with your wishes.'

'You were ready enough, however, to have it to suit your own insolent purpose,' he hotly spat out. 'But one day will not make much

difference, I daresay, therefore, to-morrow be it.'

I bowed, and withdrew to the kitchen, indignant, bewildered, and with a sickening sensation at the heart. I was completely foiled and beaten. 'The last night I shall be here—young lady mad—confined in a madhouse—tell my employer—slight inconvenience,' kept echoing through my brain, till I felt dizzy with the whirl of confused thought, and mechanically passed my hand over my face as Mr Wintock had done. The remembrance of the indignity enraged me beyond endurance, and I determined, if human craft could accomplish it, that I would trace out Miss Wintock that very night, and ascertain from her own lips whether, when I left the house, I could do any thing for her. Might not a solicitor, upon proper representation, take her case in hand, and forcibly obtain the release of her person from the fiends who now held her in confinement? Doubtless, much energy and skill would be required, but the strong arm of the law was, or ought to be, all-powerful. Yes! I would see her. Old Wintock might storm and rave as he liked. I should bid him farewell on the morrow, and if he tried to injure me with my employer, I hoped my statement would be believed, and if not—supposing I, of my disfigure and was thrown out of work—the world was wide, and I should be a kind of martyr in a good cause—the cause of decency in divorce.

Puttin; a good fire on the hearth, I told old Martha and Benita that I was to depart on the morrow, as Mr Wintock had settled all claims upon him. It was evident by the covert smile on the face of each that the intelligents gave them great satisfaction. In the course of the evening, I counted out of the kitchen as if to go to my room, and no doubt as I beat them good evening, they concluded that I had retired for the night. Instead of doing so, I quietly slipped up the back staircase. Here, as in the other, there was a door at the top, which shut the upper range of apartments from the lower. The staircase itself, however, was much darker. This door was also locked, confirming my suspicion that Mrs Wintock was above stairs. As is often the case in ancient mansions, there were several nooks and recesses in this old circular staircase. Within one of these, on the landing, I concealed myself and waited patiently. I did not much fear discovery, as old Martha's night was none of the quietest, and she usually wore a bonnet and shawl of an evening, as she suffered somewhat from rheumatism. At length I saw her coming, hobbling slowly up the stairs, and bearing a lighted candle and a covered dish.

'All right, Jack, my boy, you're on the right secret,' said I to myself. 'Los clue!'

And close. I did the ever weary in a hole. Old Martha reached the landing, put down her dark and candle, drew the key from her pocket, and proceeded to unlock the door. Then entering with her burden—which she again put down for a minute made—was about to relock it, when I emerged from my hiding place and stepped in also, shutting the door after me. The old dame turned deadly pale and would have screamed, but my hand was on her mouth. I learned that track from Benita the night Miss Wintock was forcibly carried back from my room.

'Now, my dear soul, don't make a riot, because there's no need for it. I mean you no harm, and wouldn't hurt a hair of your old grey head for the world. I only want a little private conversation with you—There, now'—taking the key from her trembling hand, and transfixing it to my pocket, after locking the door—we can have it all quietly to ourselves without fear of interruption—It's no use, Martha,' I added sternly, seeing that she was about to remonstrate. 'It's my turn for a little while now. What is the use of your calling out? No one can possibly hear you.'

Martha's teeth chattered and her knees trembled. 'What is it you want with me, man?' she asked.

'Now, be civil, old lady. No "manum," if you please. Just take up the dish and candle, and I will bear you company. I want a few minutes' speech with your young lady.'

'I cannot! I dare not!' Mr Wintock would kill me!

'Stuff! He'll do nothing of the kind. Pshaw, he is not obliged to know anything about it, unless you are silly enough to inform him.'

Old Martha bent as if she picked up the dish and candle. There was a slight noise below. Possibly Benetta had returned for a moment into the house for something. In an instant her mouth was at the keyhole, she was about to shriek for assistance, but I was too quick for her.

'You treacherous old villain, I whispered, 'if you try that dodge again, I'll gag you—Now, just listen to me. I know all about the rascally doings in this house. I know that Miss Wintock is forcibly confined somewhere in one of these attics. She is no more master than I am, so that tale will not serve Mr Wintock's purpose. To-morrow, I'm off to London, and I'll move earth, sea, and sky, till I set the authorities on the right track to find and release her. I know Mr Wintock's motive—but property. He won't have a feather of it to fly with, he is more likely to land in jail. You shall come in for your share of punishment in illegally confining her. Let me see her for a few moments, and I promise you, on the word of a man, that whatever transpires, you shall be held free from blame.'

After some further expostulation on her part, and renewed threats and promises on mine, Martha took her dish and candle and proceeded to Miss Wintock's apartment. I kept close to her, crying heavily every moment, for I felt that if only half a chance occurred, she would play me false.

Never shall I forget the sight that presented itself on my entering Miss Wintock's wretched garret. Stratched on a miserably narrow pallet lay the beautiful but haggard girl, dressed as I last saw her, but with a stout leathern girdle bulged tightly round her waist, and which, fastened with a thick strong cord passing round one of the bed posts, effectually prevented her from moving except within a very limited area. The casement was strongly barred on the inside, and the catch securely fastened. In this remote room, at the very top of the house, there was not the slightest opportunity of communicating with the world without.

Old Martha noticed the start I gave on first

entering the room, and commenced a hypocritical whimpering. 'Indeed, Mr Meredith, it's no fault of mine, nor could I help it. The all master's doing and Mr George, and I am too old and too feeble to do anything but obey orders.'

'Silence, woman!' I stately retorted, as I thrust her into the only chair in the room, and advanced to the side of the poor suffering and ill-used young lady.

The death-like pallor of her countenance, the drooping of the long dark eyelashes, and the listless rolling of the languid eyes, evinced the intense mental anguish that racked her. The instant her eyes rested on me, a sharp faint cry of joyful recognition escaped her, and she stretched out her hand. In the tumult of my distracted feelings, I seized it and pressed it warmly to my lips. A deep flush came rushing into her cheek and she until she commenced to the temple. The next instant she was, if possible, even paler than before, and her short, rapid breathing told of the excitement under which she laboured.

'O Mr Meredith—I was afraid that—I thought—I hoped you would not desert me, she whispered.

'Not while I have life dear Miss Wintock, was the prompt reply. While I spoke, my pocket hank was out, and I was sawing like a maniac at the cord to sever it.

Old Martha began to wipe her hands and to remonstrate, but her remonstrances I speedily checked.

The cord was speedily cut through, and gently raising Miss Wintock to a sitting posture, I said: 'Are you able to stand?'

'Yes, thank you very much. At least I'll try. She gave me one glance of appealing trustfulness, and turned into a pale mask fit of weeping. 'Oh, take me away with you from this horrid place! I shall go really mad, I know I shall, I am so now, almost. O my poor brain!'

I tried my utmost to soothe her. Even old Martha aided me. Perhaps her womanly feeling was touched, for I believe she was more the unlucky victim and tool of circumstances than of an intrinsically bad and hardened nature. She produced her old fashioned smelling bottle, bathed Mrs Wintock's hands and face, and induced her to eat some of the food she had brought, and I persuaded her, with some difficulty, to take a sup or two from my spirit flask, which I had previously put in my pocket in case of emergency.

At length the young lady became calmer. But I saw that it would be necessary to use extreme caution, or she would suffer a relapse, as she continued to entreat me, in the most pathetic language, not to leave her again in the power of the Wintocks. I looked at my watch, it wanted about twenty minutes to nine. Precisely at nine, in readiness for the evening ride, Mr Wintock's gig and mare would be in the yard near the side door, and Mr George's horse shortly afterwards. Mr Wintock would probably, as he often did, keep his eye waiting for him till a quarter past. George Wintock would be off shortly afterwards. Though I had spoken so confidently to Martha, I was not at all sure that some unlucky accident might not intervene if I remained where I was. Benetta might miss Martha. In fact, I was terribly uneasy and in a sad dilemma.

belly when I was for any length of time I dared not leave Miss Wintock in her present state of mind, I could not. Indeed, I think she would have attempted to force her way with me, had I shown any indication of leaving her. A lady, and perhaps rash resolve took possession of me. I could only get Miss Wintock below and conceal her till after the departure of the Wintocks, we might succeed in getting away unseen down to the village, where I hoped to house her safely and obtain assistance in protecting her, for surely none who knew her would refuse to aid, and even if discovered, I should then only have the Italian to deal with. Our time had been singularly ill chosen before. We had waited till both Mr Wintock and his son had returned home before making our attempt.

I spun out over Miss Wintock, and asked, 'Do you think you could walk a little?'—at the same time giving her a warning look.

The rapid glance of intelligence with which she replied reassured me.

'Now, Martha,' I said, 'I'm extremely obliged to you for all you have done, and depend upon it, you shall not be forgotten. But I must have the loan of that bonnet and hat for a little while, removing the one from her head and the other from her shoulders.'—'It's no use to scold, old lady! A wifful man must have his way, and so you may as well be quiet. Now, sit down again in that chair, and don't stir unless I bid you, for time is precious.—For my word, Miss Wintock, that bonnet becomes you as well as it does Martha,' placing it upon her head. 'Rather a little undid compliment to you, though. There, tuck up your hair softly out of sight in the crown, don't show any of it, on any account. Now for the shawl, slip up to the throat—so. Here's a pin. That will do admirably. I declare I should not know you from Martha herself at a yard's distance, if I did not see your features.'—Now, Martha, old girl, I'm just going to lock you in this room a little while—only a little while, you know, for I will leave the door on the landing open. Benetta will be sure to find you by and by, as if you don't make your appearance below, he will no doubt seek you here, guessing that something has happened.—Nay, Martha, as she rose from her seat in great trepidation, 'I don't wish to do anything, no gentlemanly. I do not at all fear your giving an alarm from this window, it is too strongly guarded for you to force. You wouldn't like to take Miss Wintock's place, I suppose,' pointing to the pillow from which I had released her. 'Very well. Then keep quiet, and no harm will come to you of this. You can tell Mr Wintock that you were overcome by fatigue and force, if you like. We will leave you the light, as we can do better without it.'

The hunt was sufficient. Perhaps, too, in her heart the old creature might not be unwilling that her charge should escape. Before I had done speaking, Miss Wintock and I were out in the long corridor. The door was locked on old Martha, while Miss Wintock carried the dash and cover, to enable her to impersonate Martha as faithfully as possible.

'Now for it once again,' I said to my companion, 'and I trust with better luck. But you must be as cool as you can, and keep your wits about you.

A hitch now will spoil all, for I fear this is your last and only chance. Whenever you feel inclined to faint, think of your liberty or a lunatic asylum.'

'Do not fear me,' she whispered. 'I will do my utmost, or perish in the attempt. They shall not tear me from you a second time.'

'Very good. Be as quick as you can, till we reach the last turn at the bottom of the stairs. Then, if the coast is clear, I will go forward and reconnoitre.'

Hurriedly whispering these and other hints, I led her to the turn of the stairs, and then went forward by myself. A few seconds afterwards, Martha's double came limping down and along the passage into the scullery as directed. The improvisation was excellent and complete, and but for the nervous shake at first, I could have laughed outright. However, this was no time for indulgence in levity, but for nerve, wit and silence, in action.

The outer door of the kitchen passage, which Benetta usually kept it so while he went to get the horses and ride to early for his master, I stole softly towards it, to get a bird's-eye view of what might be going on without, endeavouring the while to arrange some definite plan. Proceeding, I found I was informed that the elder Wintock had not yet departed. The dog, with the fine high-bred mien he was accustomed to drive still stood in the yard. The animal was a noble specimen of his strength, speed, and spirit, but would stand as quickly as a lamb in the Hall yard while waiting its master's pleasure, though it required a strong hand. I held the ribbon when once upon the road Benetta was busily engaged in the stable, milking and bridling Mr George Wintock's horse. I could hear his 'Whin, Dandy!' and other ejaculations as usual, in his broken English, as the animal seemed to be giving him some trouble. In another five minutes he would bring him out into the yard equipped ready for his rider.

Instantaneously an idea whirled through my brain like a streak of light, suggesting whatever scheme or intention I might have already formed. In a moment I was at the scullery door. 'What! Now—quick! Here, take my arm. Jump into the gig, the instant you catch it. Trust to me for the rest.'

Miss Wintock looked up at me in wonderment, but unobtrusively obeyed.

Out at the open door and across the yard with Miss Wintock on my arm. 'In with you, now, quickly, for dear life!'

She needed no second admonition, but half lifted by me, sprang nimbly into the vehic. I was about to follow, but as luck would have it, we were not to get away so easily. The mare, hearing our footsteps, had begun to paw the ground, impatient of delay, and the face of Benetta immediately appeared at the stable door. Probably he thought his master had come out, and might require his services.

I should have been unconscious of the fact, but in stepping into the gig, Miss Wintock slightly turned her head and caught sight of the Italian's swarthy visage. Her short suppressed cry and eager finger once pointed out to me the cause of her terror. Benetta comprehended the state of affairs at the first glance, and with a

fiere whoop, came rushing at full speed to seize the mare's head. There was not time for me to mount. Stepping forward a pace or two, and exerting my utmost strength, I dealt him a buffet which fairly balanced that which he had dealt me at the Hall door, followed up by a kick upon the shins, as he staggered backward and fell, literally yelling with agony. The mare snorted, and began to move. Smothering the mare, I sprang into the pig, and had just closed the yul as George Wintack came rushing out to ascertain the cause of the disturbance.

## HOME RULE

FROM A HOUSEKEEPER'S POINT OF VIEW

WITH a large portion of the working community in our cities and towns, economy is frequently a difficulty, and when further weighted with the responsibility of wife and family, too often an insupportable one for the necessities of life. The class which appears to suffer most is that in which, unfortunately, some degree of outward appearance—in the head of the family at least—is to be maintained, for the credit of the establishment in which he is engaged, as well as for the support of his own position in it. There are the persons who make immediately those the labouring classes—the clerks and waiters in mercantile houses, who, untrained or unfitted for manual labour, have more expensive and scarcely better salaries than the wages of a moderately skilful artisan, and without some of his advantages, for the latter's wardrobe may be confined to his suit of working clothes, with a change for Sundays, whilst the tools of his trade, once obtained, are of a durable character, and his avocation, excepting in a few instances, healthy and invigorating.

It is noteworthy, however, that this class, poorly paid as it frequently is, is yet open to the charge of careless extravagance, if not actual extravagance. It may be the reflection that the remuneration, though small, is sure, and that the end of the week, month, or quarter will furnish funds for another turn of toil, which gradually conduces to a condition of unhealthy conservatism whereby so many are enabled to endure a hard to month existence, patiently looking for the dawn of a better day, or gradually becoming ensnared in the straitened circumstances in which their lives have been passed. To this, the subject of domestic economy properly undivided is most important, and it will be well to bear in mind the proper distinction between that word and parsimony, for which it is sometimes used, and with which it is not unfrequently confounded.

The better to illustrate our view, we will suppose a family in the lower order of the middle classes, with whom careful management is a matter of the first importance, consisting of the parents, one servant, and four children, and we will commence with the article of Food, for here economy is most requisite, and very frequently but little observed. Wholesome food, and plenty of it, cannot be too highly estimated, and in no particular of household economy can the 'penny wise and pound foolish' system be more pernicious. The prudent consideration

that what is not cheap in price should be made profitable in every available way, comes in here, and to this let the careful housekeeper direct her attention. The most substantial sorts of food, such as meat, for instance, can be purchased more cheaply from the large markets than from the solitary shop in the neighbourhood where fresh competition does not step in to the advantage of the purchaser, and thus in the matter of a large family dinner yields an important saving. There is of course to be remembered the expense of the journey by bus or tram car or district railway, but that will be amply covered by the saving effected.

As roasted or baked joints are found to be more profitable than boiled ones, the nutritious juices not being so much exhausted, and a greater variety of dishes being procurable from them in that form, we will suppose the housekeeper purchases that kind of beef known as the 'rich bone,' and weighing, about twelve or thirteen pounds. In the first place, this is sold more cheaply than any other cut, in account of the bone it contains. Roasted, and served up hot, it supplies a good dinner the first day. Cold, with salad, and the vegetables that are in season there is a wholesome dinner for the second, while for the third day, thick pieces will be found which, fried with onion, or stewed, afford another variety. Of what remains, separate the fragments and fat from the bone, and the first will contribute to a roast party on a subsequent day, the fat melted down, and added to the dripping, from the roasted joint, which should have been carefully preserved, is available for use in puddings, crumbles, and, in winter, as a pleasant substitute for butter on hot toasts, and quite as wholesome, while the bone itself, having been well stewed down, with others, forms the basis of good soup, and then, having quite completed its culinary mission, and perfectly clean, can be placed in its particular receptacle, to be eventually disposed of to the itinerant pancher who makes his duty, and for the purpose.

The fat carefully strained from the surface of the water when cold, in which pork or ham, poultry, or rabbit have been boiled, is excellent for pastry, the liquor itself, and the residuum, together with the poultry and rabbit bones—and where the observant habit of saving and sucking bones is still in not permitted, there can be no objection to its employment, thus most materially in the stock for soup. As an accompaniment to the hot roast and boiled joints, a serviceable dish will be found in plain pudding of meat and flour which, with the gravy if the joint is much liked by children, and as all flour food is good for them, is wholesome as well as economical.

Bread that is home made is generally preferred to that supplied by the baker, and if a pack of flour is added a pound of rice, boiled, it will render the bread close and white, whilst the water in which potatoes have been boiled, imparts a light and spongy character to the loaf. Of course the usual salt and yeast must be used as well, but bread thus prepared will be more palatable than is usually the case with that which is made in the ordinary way. Having mentioned rice, we may remind our readers that besides the many forms of mush, mince, puddings to which it

may be applied, it is the cheapest, best, and simplest substitute for vegetables to meat. Very moderate in price, of no trouble in preparing, and without any waste whatever, it is far and away the best resource if potatoes fail, or in that season of the year when they are 'waxy' or heavy. What is useful to the Scotch, rice is the land of its cultivation, for it can be used in many forms, and is always salutary and pleasant. Oatmeal, by the way—which, excepting in the North, is associated generally with slops and messes of a sick-room—is scarcely appreciated with us who live more in the South. The rough meal has a sustaining power far beyond our ordinary bread, and it would be well if 'porridge' could be generally used as the breakfast of our little ones. Served up with milk or with treacle, it is quite probable that it would speedily supersede the more expensive and less nutritious tea, coffee, and even cocoa. Here again, as with rice, there is no trouble, no waste, but cleanliness, simplicity, cheapness, and nutriment.

If there is any garden ground attached to the house, it may be worth while to cultivate the more hardy vegetables, such as beans, potatoes, or cabbages, which require little time and attention and yield a plentiful return, but the more expensive asparagus and peas, as also fruit, it will be more satisfactory to purchase from the greengrocer, they require more care and attention than, as a matter of economy, they are worth. The greens, cauliflowers, and potatoes that have been left at dinner, can be redressed for the following day. Warned with bacon, they will afford an acceptable dinner, or will be very well come to your poultry, if you keep any, and if no other use can be devised for them, they will, if placed on a heap at the bottom of the cask with their parings and peelings, and with the bones, skin, and offal of fish, &c.—otherwise of no actual use—and now and then covered with a thin coating of mould, contribute their portion of sustaining power towards next year's produce.

The mention of poultry reminds us that many persons living in towns keep fowls, under the impression that they will be provided with the best and cheapest than can be bought. This frequently is an error. Unless poultry have a skilful 'run,' they are a questionable investment. Besides the first outlay for the birds, with the expense of providing them with a proper roost, and perhaps a wire fence to keep them within bounds, is the purchase of their food. There is scarcely any domestic animal to which fresh air and exercise are so necessary as the common fowl. Give her a handful of corn in the morning, and the same at night, with perfect freedom to rove through a paddock or orchard, and she will furnish for herself during the day and repay you with good eggs. But if, as is too frequently the case in towns, we insist on her residing in a cellar, with the 'local option' of a back-yard or a street gutter, we must not be surprised if she loses her sleek and comfortable appearance, and if the eggs she presents us with are few and coarse-flavoured.

Another opportunity for the exercise of judicious economy is furnished by the clothing of a family. Many of the clothes of the parents, or even the elder children, which have become too

much worn or too short for them, may with a little sagacity be adapted to the younger branches in such a way that the identity of the cost or frock is concealed. We regard it as a matter of no small importance in home education to prevent as far as possible the feeling of humiliation which a sensitive child suffers, if made aware that its appearance is grotesque or remarkable. We cannot forget the days when by the law of succession as it prevails in many families, we inherited the trousers or coat of our elders. But, to avert this contingency may by dexterous manipulation be avoided, and when the hereditary garment is past all further service, there is still the old clothesman to bid for the heap of disused clothes, or the poorer children of the neighbourhood, who have no scruples on such matters, or the transmutation into cloths for the poorer household, or, last, the rag bag—the contents of which can always be converted into money.

If the string that secures the diaper and grocery parcel is simply untied, or it least only cut at the knot, many a penny may be saved. If the old letters, envelopes, children's copy books, and all manuscript work, which choke up drawers, desks, and boxes, are regularly transferred from the waste paper basket to a sack kept in the lumber room for the purpose, from half a crown to three shillings per hundredweight may be obtained for them from some of the waste paper dealers. Nearly every family takes in its daily or weekly newspaper; when done with, let it be neatly folded, and placed aside till the bulk amounts to a considerable weight, when it may be disposed of at the butcher at the rate of perhaps a halfpenny a pound. If all the prunings thus obtained are put in a drawer or box kept for that special purpose, at the end of six months they will represent a sum quite sufficient to add some useful or ornamental article to the house, and without any remittance from the pocket of the master. The ordinary brown paper in which the grocer and ironmonger wrap up their goods, unavailable for the purpose we have mentioned, becomes, when placed between wadded clothes or blankets, an excellent preservative of moths, and is an admirable disinfectant when burnt, and is useful in various other ways.

In every house there is necessarily an accumulation of rubbish which is difficult to dispose of, and of which we who profess to be tidy persons are only too glad to be rid. Broken crockery, old toothbrushes and table knife handles, fragments of broken window panes, tin, unlike the tin, boxes, or old metal, find no purveyor, nor are they readily convertible to other purposes like the old clothes. For these, however, the garden finds a use. For the most effectual drainage of the flower beds, it is a good plan to have a substratum of rubbish, about six inches deep at a distance of, say, two feet from the surface of the soil, through which the run may percolate, leaving the upper part sufficiently moist for germination, but not so continuously wet as to injure the seeds and young plants. This is particularly important with a stiff soil that has no substratum of gravel or sand. For an artificial humus of this kind there are no better materials than the broken crockery and the other

worthless articles referred to, and thus most unrightly objects are got rid of in the first place, and turned to good account as well.

The boards of packing cases or wine boxes may be converted into book shelves, or painted green, into window boxes, for nasturtiums and marigolds, or as borders for the garden beds. Nails and screws, not wasted, but kept in a box where they may readily be found, will, with the assistance of a gimlet and screw driver or hammer, save many a shilling that would otherwise be paid to the jobbing joiner who works by the hour, and whose occupation, like that of the gardener on the same arrangement, is very frequently of a most elastic nature. It is a common thing for servants, in taking out the last evening's fire, to carry all the cinders to the dust lun, to be thrown out. Now, a large quantity of these are only partially burnt—indeed, in fact, for which we pay as a rule about a shilling a sack—they ought to be saved by sifting them from the mere dust, and be used again as backing for the kitchen fire.

Neglect or procrastination is one of the worst enemies to the order and economy of a household. Dolls, hinges, and the more intricate mechanism of locks, become troublesome or useless from the rust which neglect causes to accumulate. There is really no cure for this, for they make their grievances known in their own voice of complaint, or, as in some human ailments, by their indisposition to move. As soon as a bolt or a hinge creaks or a lock refuses to obey the action of the key, there is a temporary derangement that a little sweet oil will remove, but which, neglected, will become chronic and necessitate a visit from the locksmith or joiner.

It may be considered that undue stress has been laid on matters of slight importance, but it is in the apparently unimportant details where so much saving may be effected, and it speaks for itself, we could name many more. If our method could be tried for a twelvemonth by a family of the class to which we have referred, we should be quite satisfied to submit to the arbitration of experience, whether our theory is mainly one of those fanciful schemes that, in the abstract, look well, but will not bear the test of practice, or whether it affords useful and profitable suggestions for an economical system of householding.

Now, but is money a paper quantity?

Various views and opinions that have been put forward from time to time within the last year or two.

First, then, how the forecasts are made. Every body knows that the barometer is essentially an atmosphere weigher. The envelope of air which incloses our globe has weight, and consequently presses upon the earth's surface. Torricelli found that this pressure is the level of the sea is sufficient to force mercury up an empty tube—empty of air, that is—to a height of about thirty inches. In such a column of mercury, therefore, we have a constant index of the weight of the atmosphere. If we take it up a high mountain, it falls, because there is then less

air above us than when we are at the sea level. If we take it down a deep mine, it rises, because the vertical height, and consequently the pressure, of air above us is increased. But even at the sea level the column, when it ceases to be attractively stretched, was found to vary in height. Sometimes it rose sometimes it fell. At one time it moved a very little, and at another, a great deal. The variation, however, was not regular or periodic—it did not agree with the rising and setting of the sun, nor coincide with the phases of the moon, it was quite erratic. But a little further observation showed a marked correspondence between these mysterious movements and the state of the weather. A great fall of the column, it was noticed, was invariably followed by rain or wind, or both, while a steady rise generally accompanied clear, sunny, up of the weather. Careful observation soon resulted in the deduction of rules, by means of which the probable weather might be inferred from its movements. And so originated the 'weather glass.'

Why the movements of the barometer are related to the weather might never have been found out, had not the invention of the electric telegraph made a new departure possible. The meteorologist

When the readings of the barometer—reduced to sea level—at various places throughout the country are taken at the same hour, the day, and telegraphed to our main office in London, when these synchronous readings are marked by him upon a chart of the British Isles, the figures for Limerick at the place of Limerick, that for Liverpool at the place of Liverpool, and so on, and when all the places at which the barometer was at an equal height are connected by means of dotted lines—the result is not, as might almost be expected, a hopeless network of lines crossing and uncrossing each other in all directions. It is always one of four distinctive types. The dotted lines are called 'isobars,' and the figures which they form are the 'cyclones,' the 'anticyclones,' the area of wedge-shaped 'lobes,' and the area of straight 'nodes.' The two former are most

may be applied, it is the cheapest, best, and simplest substitute for vegetables to meat. Very modest in price, of no trouble in preparing, and without any waste whatever, it is far and away the best resource if potatoes fail, or at that season of the year when they are 'waxy' or heavy. What oatmeal is to the Scotch, meal is in the land of its cultivation, for it can be used in many forms, and is always salubrious and pleasant. Oatmeal, by the way—which, excepting in the North, is associated generally with slops and mounds of a sick room—is scarcely appreciated with us who live more in the South. The rough meal has a sustaining power far beyond our ordinary bread, and it would be well if 'porridge' could be generally used as the breakfast of our little ones. Served up with milk or with treacle, it is quite probable that it would speedily supersede the more expensive and less nutritious tea, coffee, and even cocoa. Here again, as with rice, there is no trouble, no waste, but cleanliness, simplicity, cheapness, and nutriment.

If there is any garden ground attached to the house, it may be worth while to cultivate the more hardy vegetables, such as beans, potatoes, or cabbages, which require little time and attention and yield a profitable return, but the more expensive asparagus and peas, as also fruit, it will be more satisfactory to purchase from the greengrocer, they require more care and attention than, as a matter of economy, they are worth. The greens, cauliflowers, and potatoes that have been left at dinner, can be redressed for the following day. Winned with broom, they will afford an acceptable change, or will be very welcome to your poultry, if you keep any, and if no other use can be devised for them, they will, if placed on a heap at the bottom of the cart with their peat, and peat, and with the bones, skin, and offal of fish, &c.—otherwise if no actual use—and now and then covered with a thin coating of mould, contribute their portion of fertilising power towards next year's produce.

The mention of poultry reminds us that many persons living in towns keep fowls, under the impression that they will be provided with eggs better and cheaper than can be bought. This frequently is an error. Unless poultry have a clean 'run,' they are a questionable investment. Besides the first outlay for the birds, with the expense of providing them with a proper roost, and perhaps a wire fence to keep them within bounds, is the purchase of their food. There is scarcely any domestic animal to which fresh air and exercise are so necessary as the common fowl. Give her a handful of corn in the morning, and the same at night, with perfect freedom to rove through a paddock or orchard, and she will forage for herself during the day and repay you with good eggs. But if, as is too frequently the case in towns, we insist on her rousing in a cellar, with the 'local opinion' of a back-yard or a street gutter, we must not be surprised if she loses her sleek and comfortable appearance, and if the eggs she presents us with are few and coarse flavoured.

Another opportunity for the exercise of judicious economy is furnished by the clothing of a family. Many of the clothes of the parents, or even the elder children, which have become too

watchful look, and the roughened outlines of the thorax, which served to complete the illusion so perfect was the deception, that I really could not feel confident that the black spot I was examining was what I believed it to be. Only one little circumstance reassured me. There was some hole or imperfection in the outer covering, through which one spot of the inner brilliant margin could be seen shining like a star. Certain now as to the identity of the moth, I advanced still nearer, and finally I found that it was not till the point of the elixir was near to move and shake the earth on which it lay, that the creature could believe that it was in danger. Then, in an instant the crumpled leaf became a living moth, with powers of flight which would have defied capture.

#### ALYRIAN GAME

The following is an extract, obtained by a contemporary, from a Report recently issued by the Austrian Minister of Agriculture, regarding the quantity of game, &c., killed in 1880 in the Austro-Hungarian provinces. Though it does not claim to be absolutely exact, it still affords an interesting proof of the abundant use of game in these countries. In 1880 there were shot: Game, 1,027,000 head, including 940,805 hares, 48,015 deer, 27,463 rabbits. Feathered game, 912,346 head, including: 717,393 partridges, 84,587 quail, 78,789 pheasants, 48,015 wild ducks, 2,070 snipe, woodcock, &c. Venison, 43,464 head, including 21,079 fawns, 12,801 roes, &c. (242 martins, 2308 buzzards, 165 wolverines, 61 lynx, 28 bears. Of particular interest, Bohemian partridges very abundant in game. It produced in 1880, 280,568 hares and 43,961 partridges.

In addition to the above, there were bagged of fur and feathered game in 1880, in Lower Austria, 264,170 head, Styria, 84,980 head, Moravia, 363,510 head, Upper Austria, 66,191 head.

The greatest number of chambers was in Tyrol and Vorarlberg, 2007 head, Styria, 1658 head, Salzburg, 1058 head. The largest number of bears and wolverines were killed in Galicia.

#### THE WILD CURLEW

On the first spring day 'mong the couching hills

For the morning sun drank the glistening dew,

On my ear there fell the soft rush of rills

From afar the cry of the wild Curlew

are 'only too glad to be rid. Broken crockery, old toothbrushes and table knife handles, fragments of broken window panes, can, unlike the rags, bones, or old metal, find no purchaser, nor are they readily convertible to other purposes, like the old clothes. For these, however, the gardener finds a use. For the more cheerful drainage of the flower beds, it is a good plan to have a substratum of rubbish, about six inches deep at a distance of, say, two feet from the surface of the soil, through which the run may percolate, leaving the upper part sufficiently moist for germination, but not so continuously wet as to injure the seeds and young roots. This is particularly important with a stiff soil that has no substratum of gravel or sand, for an artificial base of this kind there are no better materials than the broken crockery and the other

## OUR WEATHER FORECASTS

PUBLISHED weather forecasts are of two distinct kinds. We have those made fully a year in advance and embodied in *Revue Almanacs* and similar publications, and we have the twenty-four hour forecasts which daily appear in the news papers. Both find numerous believers, and both justify themselves by a certain percentage of success. But it must not be supposed that both emanate from the same quarter, or are even based upon the same source. The former is founded upon the curious misconception that it is the moon and planets that regulate our weather—a surviving fragment of astrology, the latter have their origin in an application of the laws of meteorology as disclosed by weather-ology.

We cannot at present enter into details regarding the systems adopted by the two, period or quick forecasts, but we have something to say about our daily weather warnings, which concern us all pretty directly, seeing that we pay some fifteen thousand pounds a year for them. Our forecasts may be conveniently arranged under three heads: (1) How the forecasts are made, (2) What degree of success has attended them hitherto, and (3) How they may be improved. We write for the unscientific. What follows, therefore, is not new, but is merely a popular summary of the various views and opinions that have been put forward from time to time within the last year or two.

First, then, how the forecasts are made. Every body knows that the barometer is essentially an atmospheric weigher. The envelope of air which encases our globe has weight, and consequently presses upon the earth's surface. Torricelli found that this pressure is the level of the sea is sufficient to force mercury up an empty tube—empty of air, that is—to a height of about thirty inches. In such a column of mercury, therefore, we have a constant index of the weight of the atmosphere. If we take it up a high mountain, it falls, because there is then less

air above us than when we are at the sea level. If we take it down a deep mine, it rises, because the vertical height, and consequently the pressure, of the air above us is increased. But even at the sea level the column, when it came to be attentively studied, was found to vary in height. Sometimes it rose, sometimes it fell. At one time it moved a very little, and at another, a great deal. The variation, too, was not regular or periodic—it did not agree with the rising and setting of the sun, nor coincide with the phases of the moon, it was quite erratic. But a little further observation showed a marked correspondence between these mysterious movements and the state of the weather. A great fall of the column, it was noticed, was invariably followed by rain or wind, or both, while a steady rise generally accompanied the clearing up of the weather. Careful observation soon resulted in the deduction of rules, by means of which the probable weather might be inferred from its movements. And so originated the 'weather glass.'

Why the movements of the barometer are related to the weather might never have been found out, had not the invention of the electric telegraph made a new departure possible to the meteorologist.

When the readings of the barometer—reduced to sea level—at various places throughout the country are taken at the same hour of the day, and telegraphed to one man, say in London, when these synchronous readings are marked by him upon a chart of the British Isles, the figure for Limerick is the place of Limerick, that for Liverpool is the place of Liverpool, and so on, and when all the places at which the barometer was an equal height are connected by means of dotted lines—the result is not, as might almost be expected, a hopeless network of lines crossing and recrossing each other in all directions. It is always one of four diagrammatic figures. The dotted lines are called 'isobars,' and the figures which they form are the 'cyclone,' the 'anticyclone,' the area of wedge-shaped isobars, and the area of straight isobars. The two former are most

frequently met with in British weather, the two latter are somewhat rare.

The cyclone, when perfect, is a circular or oval area, the isobaric lines forming concentric circles. In the middle, the barometer is lowest, on the edge of the area, it is highest, and in the space between, the readings pass by slow or rapid gradation from the one to the other. Mark the variable gradation. Its importance will be seen directly. Now, the direction of the wind and the distribution of the weather throughout this area, we have all in variable. The wind circulates round the centre in the opposite direction to the hands of a watch. On the east side, the wind is southerly, on the west side, it is northerly, on the south side, it is westerly, and on the north side, it is easterly. This is a slight inward motion, however—the wind really blowing in a sort of spiral—which gives the easterly current on the north of the area a slight touch of the north, the westerly one on the east side a slight easterly direction, and so on. Then the force of the wind is regulated by the steepness of the gradient just alluded to. If the edge of the cyclone be forty miles from the centre, and the difference in pressure between the two about an inch of the barometer, the wind will be far stronger than if the distance be eighty miles and the difference in pressure the same, or the distance only half as much and the distance the same. To make this a little clearer, suppose the barometer at Edinburgh to be 29.50 in Hg, and at Glasgow 29.30 inches; that would be a very steep gradient indeed, and the gale might be expected to be severe, but if the distance at Edinburgh were only twenty miles in, the gradient is not very steep and the wind might not be violent. Thus, by looking at a chart on which the isobars are drawn and the isotherms read, we may, indeed, the meteorologist can tell with approximate correctness the direction of the wind and its force over the entire area of the cyclone. In the centre, as a rule, the air is calm, with stifling heats.

Generally speaking, the weather on the eastern side of a cyclone is cloudy, warm, muggy, and subsequently wet, while on the west side it is clear, cool, and showery. Now, were the cyclone stationary, so far as our knowledge of the weather is concerned we should not gain very much by all this knowledge. We might gather from the chart that rain was falling here, and that it was showing there, but we could not have that knowledge that the sun or the showers had actually set in. As it happens, however, cyclones move. They pass over us generally from west to east, or south-west to north-east, and it is the fact of this motion that renders forecasting possible. We shall have occasion to return to this point presently.

Having so fully described the cyclone we need only indicate the chief features of the other figures. In the anticyclone, which is stationary, the characteristics of the cyclone are exactly reversed. The barometer is highest in the centre,

and lowest at the edges, being abnormally high throughout the whole area. The wind circulates in the same direction as the hands of a watch, and with a slight outward motion. The weather throughout is calm and fine—frosty in winter, warm in summer, with local thunderstorms. The weather that accompanies such a sharp isobar is 'too fine to live,' being what is called a 'pet day' between a cyclone just passed and one approaching. Then, lastly, the straight isobars—which invariably run east and west—mark a high barometer in the north with blue sky, and a low barometer in the north with fastidious cirrus clouds—'grey mares tails'—and sometimes blustering winds. This distribution of pressure is favourable to the passage of cyclones, and so is generally preceded by rain and wet.

We may now see in a general way how the forecasts are to be made. Suppose that the returns from all the stations show a normal state of things, except those from the west of Ireland, where the barometer is reported to be falling, the temperature rising, the wind southerly and increasing in force, and dark masses of cloud rolling up. These indications mark unequivocally the approach of a cyclone. It has travelled across the Atlantic, and its 'front' has just reached Ireland. Now, we know well enough that as the disturbances cross our islands a storm of wind and rain—of greater or less severity—must be in the way, while showers and squalls with blinks of sun shall bring up the rear. The forecast, therefore, has only to determine what part of the cyclone will be over us at certain places by a certain time, in order to forecast the weather that will prevail at that place at that time. In order to do this, it is absolutely necessary that he know the centre of the cyclone, its direction of motion, and its rate of progression. Unfortunately, these are particulars which our irregular position renders it impossible to get. The disturbance is brief over us before we know any one of these elements with certainty, so that we have to guess. In the case of an anticyclone, given such holds a still more important place, for it is weather that then allowed to set in, and if it the forecast has no knowledge whatever. We thus see that although our forecasts are founded upon a sound principle, the circumstances of our position renders them to a great extent mere guesses.

Of the errors which are attended the daily weather predictions we have not very much to say, for so far as any practical benefit is concerned, they are prodigiously small. Until quite recently, the most conflicting opinions were held on the point. One person said he found them to be fairly accurate, another maintained that they were as often wrong as right. Generally, however, the tide of opinion has turned against them. The official Reports, which may be assumed to put the best face on matters, show a percentage of success very far from satisfactory or encouraging. Early in the year, Sir Edmund Beckett published a letter in the *Times*, in which, by a direct comparison of the forecasts and the actual weather for twenty-four days, he showed the probability to be ludicrously wide of the mark. And since then, the opinion has been generally expressed that they are little better than random guesses, and are practically useless. It seems, then, that one of two things must be done,

either the attempt ■ was duly succeded must ■ abandoned, or in effect must be made to effect an improvement. The ways in which the latter can be done, we propose considering, in a future paper

## ONE FALSE, BOTH FAIR;

OR, A HARD NOSE.

CHAITIN VII.—IN REGENT STREET

It was the noon tide of London life, the time when idlers and toilers, the great and the gay, and those who are neither gay nor great, but none the less important members of the social hive, swarm about among the burning streets, while the dull, never ceasing roar of wheels and tramping feet and human voices blend in the deep dissonant chorus that a great city sends forth, floating on the summer air. Before one of the well known shops in a gay thoroughfare stood a cartage, on the panels of which gleamed the mahogany leaves of a Marquis, but what attracted most notice was the exquisite beauty of its solitary occupant, a slender, useful girl, dressed in black, and whose bright hair flashed golden in the sunshine.

'Who is she?—Why, I'll be my dear fellow, the very thing on the carriage door might tell you that much,' said one self-satisfied lounging idler to a whiskered journeyman from a friend, new to London, who was held by him and who evidently regarded him as a well known Member of Council. 'That's young Lady J., my man, or a near—the Marchioness, don't you know?—only left a widow. Pretty as mine, but she's and charmingly rich, as I happen to know. Saw something of them, the Leominsters, up the Nile, and came home, too, in the same ship with her and a charming sister, Mrs. Osborn, I'm happy, and I can assure you.'—And then the speaker, who was no other than little Dick Tittle, poked out of curiosity, and the rest of his conversation, useful or not, as to the circumstances, characters and prospects of the Marchioness and her sister, reached no other than his companion.

The lady whose prospects were thus being discussed had not seen, or at least had not long missed, her former fellow journeyer Tittle, indeed, her beautiful eyes took little heed, in their daily gaze, as it into the face of the familiar features, of the proverbial. There was a sad and painful expression in her face, and there was something almost touching, too, in the marked contrast between her looks and the proud position to which her rank and wealth and family gave her an undisputed claim. There was a great income and vast hereditary influence at her disposal. She was young and noble, and she was free, as free as any girl, to give her hand where her heart should accompany the gift, or if she chose, to reject sole suitors of Cassel Vaux and its wide domains.

It was plain that she had no personal interest in the fact that her baronet stood opposite to the renowned Regent Street shop, for her companion Lady Barbara had just quitted the carriage to enter it. No obsequious male satellite of Alceste Show and Squanderish came bustling deferentially to the carriage door to exhibit shawls, or a hand in dress of jewels likely to

tempt a customer no less. It was clearly not on her own account that the mistress of Leominster House, and (sic) Vaux remained a stranger in that crowded thoroughfare.

Presently, along the Regent Street pavement, there came, with measured tread, the figure of a young man, tall and manly and handsome, with a face as sweetly a little as in that of Priam, no other, in fact, than Arthur Talbot of Oakdene in Hampshire. With a start of surprise, and a glad look in his thoughtful, steady eyes, Arthur Talbot came up to ■ carriage, lifting his hat as he did so. 'This is quite an unexpected pleasure ■ me,' he said, as his eyes met hers.

The young lady moved herself a little from her brother's looming attitude. A sudden change came over her face, and there was no solution in her eyes and no cordiality in her tone as she said softly, 'Ah, Mr. Talbot, you here—in London?' while at the same time she slowly surrendered her little hand to the young man's eager grasp.

A wit of cluck, as it may be called, suddenly began to idly, came over Arthur Talbot as he noted the change of his companion. 'What had he done, that his frank and sunny wit, his own gallantry, to whom he had sold of many a willing service in the field, I told it thus, in his presence? He had never turned away from the sternness of that old return in a country where travelling, his parents are of necessity the more much together, and had never known the respect he owed to her and her unprotected sister and poor Wilkes's mother. That she had never really loved, as lovers love, the late Marquis, than this as he had done her duty by him, and much as she mourned for his Arthur more than expected, yet he dared not have a word in more from what he did not had told him, that he was anxious, he had ever gleamed fit in the world or manner, or his wife how well he could read it that day, among the painted terrors of Italy, when the stars were seen, on a the church of the noblest diagram, and in Michel de Lorraine's company, among the dark woods of the Sacred Isle, and he and the young driving lord sat together, looking out over the waters of the lake.'

'I was a selfish fellow, a selfish fool—to attach that poor child to a man, as some still might be tempted to a sinking ship.' Such had been Wilkes's words as he bowed with downcast eyes over the journeyer. 'He never loved me, never he would know what love is.'

'And yet — Arthur Talbot had begun, despite attempts, but in an unobtrusive manner, for it was awkward subject on which to talk.

'And yet he is a generous, you will say—did not, in the presence, many more my memory, Arthur,' interrupted the young lord, a slight flush came to his cheeks. 'No,' Talbot, I know that she did not. I told it all over really understood her heart, in my daily dealings and peace point of view, was the place which she had made her for dinner, in the matrimonial history. But, poor child, she had a poor home, and no mother, no able sister, to counsel her, and was of a plastic nature, and so, I fear, said "Yes" to the first man of sufficient rank and

king; and he knew also that Wilfred had never liked his townhouse.

'It makes me shudder, I feel always as if I were entering a museum,' the wily young lord had said, once and again, to his last friend. There certainly was something opposite about its very appearance, something picturesque in the respectful grimaces of the well-to-do denizens. It was all very fine, decorous, and well, as it were, funereal were going on—ill, as Arthur thought, unbecomingly to the glib masters of so much dusky splendour.

## THE AGEING OF THE EYE

THE department of science which is busy wrestling with the production of a new light for the world is a great sensation in the world, while the bunch of it which has to do with the miraculously delicate organs by which alone we are able to avail ourselves of any kind of light has attracted the attention of comparatively few but those who are professionally interested in it. Yet, if we look back over the past twenty years, or less, and attentively consider the progress that has been made in each, we may almost be inclined to doubt whether, after all, ophthalmic science has not made somewhat quite as wonderful in this way as the which have advanced the kindled science of light—produced by electricity.

The subject is far too wide a one to be dealt with as a whole within our limits here, but there are one or two points of special interest that may be touched upon, and we cannot do better, perhaps, than present them in their general outline—given in a valuable publication, entitled *I might Good and bad*, written in a popular style by Mr. Woodman Little, well known as a leading authority on ophthalmic science.

The chief features in the constitution of the eye are, we suppose, generally understood. In principle, says our author, it almost precisely resembles the common camera obscura of the photographer, which, we may explain, is merely a dark box with an adjustment of lenses in the front of it, and a ground glass screen at the back. The ball of the eye is the box of the camera. The transparent cornea in front is a bow window admitting light into the box. The iris is a coloured curtain to be pulled back when too little light is entering, and to be drawn forward when there is too much. The pupil is the aperture surrounded by the curtain. It need, until quite a recent period, to be supposed that the blueness of the pupil and the darkness of the interior of the globe of the eye were due to a power of absorbing light possessed by its inner parts. It was thought that none of the light passing into the eye was reflected, and hence it was supposed that the interior of the living eye could never be seen. This, however, was altogether a mistake. It was a perfect error and an amazing amount of honesty, the late Mr. Charles Brücke discovered a means of rendering every detail of the interior of the eye visible. It was found that there was no such absorption of light by the interior of the eyeball as had been supposed, that light was in fact reflected, and the observer could not discover the fact without being himself sight,

in front of the pupil, and then, of course, he perceived the light entering in the interior of the eye. In the writer of this had an opportunity the other day of making a minute inspection of the interior of the eyes of a patient at one of the large London hospitals, where—as everywhere else where ophthalmic surgery is practiced—the 'ophthalmic eye' is so commonly in use, that eye doctors of the present day cannot but wonder how their predecessors could have got along without it. This simple and beautiful instrument—which, when Philæus invented it, singular to say, was thought to be of so little practical use that the idea was almost to be lost, and had to be re-invented by another philosopher, Professor Helmholtz—has resulted in many most important discoveries connected with the mechanism and diseases of the eye.

The inside of the eyeball is filled by transparent liquids, in the midst of which is suspended a beautiful crystalline lens, through which must pass all the light that enters the eye from the front. This crystalline body, and the fluid before and behind it, may, for our present purpose, be compared to a camera obscura—more exactly, one lens—corresponding to the lens of the photographer's camera. This transparent medium, just as in the camera, there is upon a screen behind it an image of whatever is in front. The screen is the retina, which receives the optic nerve—the nerve coming from the brain to the eye, and spreading over the inside of it like a very delicately sensitive lining.

Now, if we take a perfect human eye and a very accurately fixed camera, the giving out, so to speak, of the distinct image, the two instruments will in principle exactly correspond with each other. In each case, parallel rays of light coming in from the distant object will fall upon a convex lens, and will be refracted—thus, being—towards each other, and will meet in a focus which falls exactly on the screen behind when a clear, sharp picture of the object will be produced. In the case of the eye, the screen, as we have explained, will be the retina which will receive the picture, and will convey it to the brain, and the distinct object will be clearly seen. Thus much has long been understood quite well. But here now is a remarkable difference between the two instruments—the eye and the camera. The eye may be taken from the distant object and turned upon the finger nail or a book in the hand, and instantly this near object will be seen with perfect clearness. Turn the camera upon some near object, and nothing can be seen at all clearly till it has been re-adjusted. How is this? If the camera requires re-adjustment, why does not the eye? The fact is the eye does require it. It is just as necessary that the eye shall be re-adjusted as it is that the camera shall be. That this is really the case, has long been recognized. Indeed, if we observe closely, we shall be quite conscious of some kind of adjustment taking place when we turn the eye from one object to another. The light is almost instantaneously adapted to the fresh object, but until it has been adapted, we do not see the thing. 'If, says our author, borrowing an illustration from Professor Donders, 'we take a piece of net and hold it between the eyes and a printed page, we may see pictures as distinctly the fibres of the net or the printed letters on the page, through the interstices of the net,

but we cannot clearly see both at once. When we are looking at the letters, we are only conscious of the net as a sort of intervening film of an uncertain character, and when we are looking at the net, we are only conscious of the paper as a greyish background. In order to see the one and then the other, we are quite aware of a change which occurs in the adjustment of the eyes; and if the net is very near, and we look at it for any length of time, the maintenance of the effort of adjustment becomes fatiguing. The fact that some alteration in the eye, having the same effect as the refocusing of the camera really does take place, was known only established, but the nature of the alteration and the mechanism by which it was effected are quite recent discoveries.

We mentioned just now a crystalline lens suspended in the midst of the transparent fluids which fill the globe of the eye. 'LAW' says Mr. Carter, 'is a solid body, which is enclosed in a delicate, transparent, and thin tunica membrane. In shape it resembles an ordinary convex lens, except that it is less strongly curved in front than behind. In youth it is a soft or modelled firm and highly elastic body, perfectly transparent and colourless, and its surface is the bright crystalline. This is now known to be the little focusing apparatus of the eye. Let us now look at this perfect eye giving us a distant object. The eye is in repose, there is no strain upon it of any kind, and this lens is in its normal position, and is held easily, so to speak, just inside the pupil by an elastic membrane stretching from it and attached to the wall of the eye. If now, we suppose the eye to be turned upon some near object, then the rays of light coming from that object instead of being perfectly parallel, as they were before, will be divergent, and the lens in its normal condition will not be able to direct them sufficiently to bring them to a focus on the retina. Either the retina must be moved back a little, or some change in the refracting power of the eye must take place. Various theories have been propounded from time to time, but it has only been of late years that the real facts have been known. It is now certain that this little crystalline lens has a most wonderful power of changing its form. The moment the eye is taken from a distant object and turned upon a near one, a ring of muscle, hidden round the edge of the lens, pulls at the elastic membrane which holds it taut, as a violin would say. The elastic membrane stretches a little, and the lens bulges out before and behind. It becomes more convex, and the more convex the lens, the greater will be its refracting power. Thus, the divergent rays from the near object will be brought to a focus in a short space in the practically parallel rays from the distance. In other words, the eye has adapted itself to the altered distance, the image falls as before exactly on the retina, and the thing is again clearly seen.

If this simple and beautiful mechanism be understood—and after all, it is only the same mechanism of the thing that we can pretend to any knowledge of—the power by which the muscle and membrane pull against each other with such a nicety of balance as to perfectly and instantly adjust the focus, is a mystery as profound as it ever was; but if we understand

this simple and beautiful mechanism, we shall be able to understand something of the changes in the power of vision which usually take place with advancing years. It is a common observation that short sight has a tendency to improve as years go on—that it has a tendency to lengthen. It is worth also to speak of short sight as an exceptionally strong sight. Both assumptions are pronounced to be erroneous, and it is easy to perceive where the error lies. The power of the eye never varies in its distant range—apart of course from disease. As we have said, a distant object is seen by rays that are practically parallel, and an image is formed on the retina merely by the passive reception of those rays. So long as the media of the eye remain transparent and the optic nerve unimpaired, the distant range of the eye will not vary, because it depends not upon any muscular power of accommodation—not upon any effort of the eye—but upon the natural formation of the eyeball and its merely passive power of reflecting light, precisely as an ordinary glass lens does.

The sight of a near object, on the contrary, involves in the case of a normal eye an actual muscular effort. A near object is seen by rays that are more or less divergent, and which require to be more powerfully refracted than the parallel rays in order to bring them to a focus within the same space. We have seen how this refraction is brought about—by an alteration in the shape of the lens. In youth, this alteration is easy enough. Elastic membranes yield readily, membranes are vigorous, and at all ages, the lens itself is soft and highly elastic. But, as years go on, a gradual hardening process takes place in this crystalline body. It gradually loses its elasticity, and becomes more and more rigid, and the power of accommodation is constantly diminished. It is found on an average of observations, that at ten years of age the crystalline lens may be considered so convex as to give a clear image of an object three inches from the eye. At twenty years, it will only accommodate itself to an object four and a half inches from the eye. Anything nearer will be obscure, because the lens will not assume a firm sufficiently convex to reflect to a focus on the retina rays of light so divergent as any nearer object will radiate. At forty years of age, the 'near point' has reached a distance of nine inches, and at fifty, to thirteen inches. At sixty years of age, the lens has so far lost its flexibility, and therefore its power of responding to the muscle, that it cannot ordinarily give a clear image of any object less than twenty inches

but only when it comes in parallel rays. Parallel rays it can converge on the retina, but divergent rays require that extra refractive power which the aged eye has lost by the hardening of the lens.

Not so a matter of distance, then, but in the ordinary course of years, and in every eye alike, as the bodily weight gradually waxes from the country of near objects around, and permitted to turn a clear vision only upon things afar off.

When the eye has so far lost its power of assuming sufficient convexity to bring a clear

image to the retina, a pair of convex lenses in the shape of spectacles carefully adapted to individual requirements will make up the deficiency to a merely; and one of the strongest impressions Mr. Carter's book is calculated to leave on the mind of the reader is, that an immense amount of discomfort would be avoided, and as many a good pair of eyes would be saved, by a reader resort to the aid of spectacles, provided only that they be selected under skilful advice.

## THE MAN IN POSSESSION.

### THE LITTLE CHIEF—CHAPTER IV.

We started off as for dear life. At first, the mare seemed a little, and seemed inclined to be troublesome. But she found that it was a practical hand that held the reins, and resigned herself to obedience accordingly. Instead of driving down the avenue to the gate which led into the village, and which was only about three hundred yards from the house, I turned off sharply on leaving the yard, and chose the gravel road which led to the principal entrance of the manor, passed on through the entire breadth of the park to another gate on the far side of it, and which opened into the high road. By adopting this course, the odds were considerably in my favour, for I hoped to reach the park gate and emerge into the high road before any one could start in pursuit. Once fairly on the road, I would try the mottle of the mare. If, unfortunately, we should be overtaken, and it came to a close fight—which I seriously doubted—the better way was from Blackthorn Hall the better, and the greater chance I should have of dividing our pursuers, and grappling with them singly. Of one thing I was certain, and it rendered me sanguine of success—as Mr. Wintock only kept two horses back the mare, only two mounted horsemen could follow. He would not try a vehicle, for his others were heavier than the grey, and would give our pursuers as a great deal of trouble.

"Hush, hush, hush!"—as the mare, being fresh from the stable, began to lay her ears back, and to ridicle myself in her work. It was with difficulty that I could restrain her from dashing off at full speed. We should require her utmost vigour, and by "I did not wish to wind my animal as starting, but to husband her strength in a long pull."

Blackly across the park at a sharp trot. The gate was reached. Throwing the reins to Mrs. Wintock, I lay down, under the gate, and led the mare through. Up again and off, but rather faster than before, though I still held the mare in check, for I could not then use a heavy drag for her up a long steep hill a few miles distant. If we can only reach its summit, we will then be not more than a dozen miles from Rikish station, whence we can reach the metropolis. It was rather a trying task for the mare, but she must and shall do it. Mrs. Wintock had a really spoken sense, and it was from the hill, ascending and it was of distracting my attention, but evidently in a state of great excitement, and every now and then she looks back repeatedly and earnestly through the looming darkness, and starts nervously at the slightest sound.

The foot of the hill is gained. It is a much

heavier drag for the mare than I had anticipated; for the road on this path is but a level gravelled, and with a vehicle behind and two persons in it, no animal can fairly be expected to ascend it at full trot. Suddenly, Mrs. Wintock clasps my arm. "Listen!" They are already on our track.

I turn my head. The sharp pines are singing, horses' hoofs strike furiously on the road. We are pursued, and by more than one person, there are at least two on our trail, and they are following us at full speed. No doubt the Wintocks have saddled the extra horse, and will have without no means, but on foot, to regain their captive.

The mare tails and pants as the sheep activity begins to tell upon her power. It is brutal to give her the whip, but it must be done. She must strain every muscle to the utmost, even though I feel that I am doing the plucky animal a great injustice.

We are now at the half-way up the hill, and the remainder is not really so steep, in fact, nearly a gentle rise. With a son in, a proud town of her driving mare, and a loud wail of defiance, she puts up her ears, and increases her speed. She has caught the clatter of the riding boots behind, and, with the instinct and intuition of all spirited animals, she determines not to be deceived. "Come, come!" Is it not that strike with the whip, if I have to fight our battle out on foot on the road. In fact, there is no occasion, on gaining the ridge of the hill she has looked. The sound is nothing but dispiriting in effect from her but, the whole is now whirling with a fierceness that renders us dizzy. I can hear and feel the strain upon the shafts as her iron-clad heels dig the spurs in the flanks on the road, and every instant expect them to snap like rotten twigs. Will the riders fall and the springs strain? The strain is enough to make the wheels and spokes fly round.

The moon is just rising above the horizon. By her light we can discern two mounted men coming on behind at a great pace, one is considerably in advance of the other. No doubt they are the Wintocks. They are gaining rapidly upon us. Ah! the foremost is Mr. George. I recognise the horse also, and the swift supple way he usually rides, and which is more than a match for the mare at any time, much more so with a vehicle and two persons behind her. There is no help for it, and we cannot escape an encounter.

How fast were our pursuers' ride! George Wintock is within a hundred yards. I fancy I can see by the light of the moon that his mare is steadily with mine. I can see his quadruped strike the road's surface in the flanks of his charger, and order me to come up with him. The mare is getting over her pet, and is slackening her speed. I tighten my grip of the reins and speak courageously to her. She is under a wound and well in hand. Shall we pull up at once and do better? No, we will hold on till the last minute.

The foremost rider is close upon us, the second is not far behind. With loud imprecations, they shout to us to stop. I glance at my companion. The cool night air and the hope of escape have wrought wonders, the stern, almost fierce light on those luminous dark eyes reassures me.

'Can you take the reins for a minute?'

She stretched out her dexter fingers by way of reply.

'Pull evenly and not too tightly. Keep her in the middle of the road, if you can. Be cool, and let her go her own pace.'

'Draw up, or you're dead man!'

I turned. George Wintock was within a yard of me, his hunting whip raised, the heavy handle about to descend upon my skull. Springing to my feet and balancing myself as best I might, I parried the blow, parrying his blow and keeping him at bay. I knew that I had the longer weapon, he must have changed his tactics for a dastardly mode of attack, of which I was, let alone a sportsman, who is supposed to love his horse, could not possibly be guilty. Springing, his steel, he rode past me to the mare's head, and raising himself in the stirrups, aimed a crushing blow just behind the ears, intending to fell her to the ground, in which case we should in the nick of time have been at his mercy. It was well meant, but it the critical moment the animal swerved slightly, so as to crush its full force. It was, however, most readily powerful to make her stumble and sink almost upon her knees. But the instant she fell once reckoned without his horse. He was within reach of my whip handle, and, as the mare rose, I brought to a point of desperation by our position, and incensed by his cowardly and brutal act, swung the butt end with such force, striking him on the side of the head, breaking the whip handle into several pieces, and knocking him sprawling against the bank by the roadside. I had the satisfaction of seeing his horse gallop sleekly away.

A shock burst from Miss Wintock, and I clutched the reins. It was high time, for the poor mare, mad with agony, was up on her hind legs, fighting with her snout in the air for a second it seemed as if we should topple over, the next she was straying from side to side like a drunken man. Mechanically, I drew one of my small pistols—in my excitement, I had left that morn'g entirely forgotten.

'Keep off, sir—keep off, or you value your life!' I shouted to the old Wintock, for he was close upon us.

His reply was a torrent of imprecations and threats.

'Give it to me!—You are not to the mare, and the horse girl is the wickedest petal quickly from my hand! I know how to use it, and will not be beaten alive!'

In truth, there was full of opinion for both my hands, so momentarily I checked the poor animal to fall in her flurry. It was as much as I could do to keep her on her legs.

Encumbered with the mare, there was no chance of defending myself in the gap. I was about to pull up short, jump into the road, and face the enemy on foot when a heavy blow from the butt end of Mr Wintock's whip across the back of my head struck me from my seat. Had I not let go the reins with one hand and caught at the side of the mare, I should have fallen on the mare's back. As it was, I slipped sideways to the bottom of the gap, leaving marks upon the splashboard. The mare gave a kick, and was nearly down, but with a struggle recovered

her footing. Mr Wintock's arm was raised to repeat the blow. I gave myself up for lost, for he struck with tremendous force. Suddenly there was a vivid flash and a loud report. Miss Wintock had fired straight at our assailant, who on the instant had pulled up short, so that the ball struck the animal instead of the man's thigh, with the wound, alighted at the noise, it uttered a loud snort, bounded aside, galloped a short distance, and then fell, Mr Wintock narrowly escaping being crushed as it stumbled and tumbled upon the ground.

The report of the pistol startled the mare and seemed to arouse her fury. Pricking up her ears, she shook herself till the harness rattled again, then started forward at a brisk pace, though not nearly so fast as before. The Wintocks had got the worst of the encounter. Yet our plight was but a sorry one. I could scarcely keep my seat in the gap from the effects of the blow, which had almost stunned me. My wound, too, bled profusely, saturating Miss Wintock's white kerchief, which, as we rode along, she had contrived to bind around my head, in spite of her own nervous agitation.

We had gained the level road and our progress was easier. But the mare had been cruelly used, and it was evident we did not stand a long journey without rest. The station was still many miles distant. In her present state, she must knock up long ere we could reach it. Indeed, I was far from feeling sure that I could myself hold out during such a journey. There was, too, just a chance that Mr Wintock, being well acquainted with the locality, might, by misrepresenting the case, or by bribery, or by an admixture of both, procure fresh horses and aid without returning to Rutland Hall, and then communicate the parents. It was an ugly fact—I had literally stolen his mare and gelding. I had also eloped with his maid, for so he might term it, though she was an English nurse. There, on the face of things, were plausible pictures by which he might make command and resistance from any reasonable person. Before we reached a long day's journey, which we must cross. There might be either danger from traps or from gang of rascals, who not infrequently encamped in that locality. In my present state I could be but of little use to my fair companion as a defender.

Miss Wintock seemed to share my unspoken thoughts. Turning to me, she said 'Mr Meredith, you have let a beautiful maid and trouble on my account. It would have been better, perhaps, for you to have left me to my fate.'

'My dear young lady, do not pain me by indulging such a thought for a moment. The occasion demanded it, I would gladly do the same again. The task to me is nothing. I only wish I could see my way clearly what next to do for the best. But I confuse myself totally. I am.' I spoke faintly and irresponsibly.

'Can we not seek shelter for a while, at least till the first morn'g happens up? Your wound could be looked to, and the mare might rest a little.'

'I fear that would not do. The Wintocks, knowing that we are on the high road, will probably guess that we shall make all haste to the metropolis. Dependent upon it, they will not part with you without another effort. It is now getting

very late. If we stop at all, we must put up till the morning, for I do not know how we could start again from a strange inn till early dawn. No doubt our pursuers will make every inquiry in following us, and will be quickly on our track. What if they should overtake us, and give us charge to a constable for skulking the horse and girl? Not that I care for myself, but you would be left without a protector, and entirely at their mercy. And yet I fear that I could do but little in that way just now. Indeed, I am at my wits' end, for it is plain that we cannot travel much further in our present plight.

'Then why not leave the high road at once? See! there are lights in that valley yonder to the left, and there is a turning a little further on, which apparently leads this way. Let us try it. Possibly, we may find a safe refuge. They will not dream that we dare stay so near the Hall. If they hunt for us at all, it will be further away.'

The suggestion struck me as a capital one, and in fact there seemed to be no alternative. 'Good!' I said, 'very good.' A lady's wit creates a man's invention, any time! So saying, I turned the horse's head, and leaving the high road across the common, drove steadily down the spot where the lights appeared.

At about two miles' distance we found a scattered village. The lights we had seen were reflected in from the windows of the only inn in the place. The house was just about to be closed for the night, for the one or two who always stay to the latest minute to drink in extra glass were departing, some of them with rather an unsteady gait. Ringing the bell, I gave the man and girl into the cheery landlord's keeping, and, with Miss Wintock in my arm, walked into the house. Besides a small parlour in the low parlour, taking it very coolly. Making myself quite at home, I handed my companion to a chair and called for refreshment. While he was waiting, he said, 'Landlord, I want a sleeping apartment for this young lady.'

The fellow was a mere dol, sheepish, courteous, and blundering, apparently a good tempered kind of elf, yet sufficiently wise when his own interests were concerned. He eyed us both for a moment very suspiciously. Truly, neither of us cut a very respectable figure. Miss Wintock, her plain dark dress, unmounted by old-fashioned antiquated corset and thin blue skirt, and I with my wounded head bound up in a blood-soaked handkerchief. There was sufficient reason for the man's distrust. 'Very sorry, sir—very sorry, indeed! can't have it. Never let beds to strange folks these times on night.'

'Well, but my good man, you see?—I command a monstrosity.'

He gruffly cut my speech short. 'Nay! I don't, and I don't want. You can't have any beds here, and that's that.'

Just then the landlord entered the room. She seemed to be rather a grating sort of person compared with her spouse, and to be about ready to rest. I at once appealed to her.

'Madam, I am requesting the landlord to oblige me with a night's accommodation for this young lady. We have been attacked on the

road, and compelled to turn out of our way, and we cannot possibly reach our destination to-night. I am a sick man, and with any shift myself—a sick woman in my hand, or a scratch on the neck by the fire here. Put me anywhere you please, so that you make the lady comfortable. You have our man in the stable and our girl in the yard, put them under lock and key as security if you like. We are willing to pay to the full any reasonable charge as well in advance. What more can you require?' As I spoke, I took out my purse, not very heavily lined, truly, but sufficiently so for present need. 'Monty Mrs Wintock had a son.'

The landlady glanced suspiciously at Miss Wintock. She could not make her out at all. Her costume was decidedly not that of a lady, but the word 'attacked' awakened her curiosity.

'Is my son' attacked by them rascals? I am glad they did not rob you, for I see you have still your purse. How did you manage to get away from them? And then she hurriedly proceeded with a string of eager questions, scarcely waiting for a reply.

'She is really a lady, I am inclined to say. I interrupted. 'You surely will not turn her out again into the road at this hour of the night!'

'But I cannot understand why a lady should come abroad in such dress as this, she replied crestfallenly, while she spoke, in order seemed to force its way into her mind, and she archely added, 'unless it is a runaway match. In that case, my husband and I would rather have nothing to do with it. We might, I suppose, be able to help.'

'I shall think of it. I shall think of it. No runaway folks in Bob's house, if he knows it. Come, young people, you must go further, we can't have folks like you here, I think I cut the landlord, moving from the room, and calling to the boy. 'Now, put that 'ere wine in the lady and I will run a good one.'

I was about to remonstrate further and more strongly, but Miss Wintock rose indignantly to her feet. 'Hitherto, her natural shyness, combined with the false and very unpleasant position in which she was placed, had kept her silent. Unhappily the old fellow, and running the hideous bonnet, she shook her long black hair until she hung down in clattering masses on her shoulders. 'Yes, landlord, I am a lady—though you seem to doubt it—and a very shamefully injured and injured one. I was not compelled to enlighten you as to my respect for my own affairs, but this gentleman has just asked his life in my service. I am in a fit state to drive to the next town, even if it were not so late. I beg of you in a manner if you have any manhood in you—and for humanitary sake, to accede to his request. I pledge you my word, my honour as a lady, she continued proudly and proudly, and with a short and loud laugh, 'that you must not rob. We are not burglars, that you should dread us.'

The moment Miss Wintock thus spoke her bonnet and began to speak, the landlady fixed upon her an earnest scrutinizing look, bending forward with parted lips and scanning her features narrowly. 'Why—why?—in it be!' she exclaimed in wonderment, eagerly seizing the young lady by both hands. 'Why, Bob, 'tis Miss Wintock, as I'm alive! Don't you remember my

dear young mistress, that we'll be at the Hall?—Oh! my dear young lady, who could have dreamed of seeing you in such a public! Whatever has happened! Where have you been so long! They say you left the Hall and went abroad, after your poor pa's death—say here! Yes, that you shall—for a twelvemonth if you like, and have the best bed in the house!

The sudden outburst of the landlady took Mrs Wintock by surprise, and she was bewildered as to the nature of the attack in such a public style as to admit of no reply.

Bob Simpson had returned to the bar-pullover, after howling out his evidence to the hostess from the passage, and had stood as if stupefied during Mrs Wintock's transformation and passionate appeal. It was more than his very limited stock of business could cope with. He had half turned away again, possibly with the intention of hastening the hostess's movements. But his wife's exclamations brought him to a sudden halt, and he remained staring and goggling with open mouth, as the mutual recognition took place. Mrs Simpson, in her delight, almost forgot Mrs Wintock took into the chair from which she had risen.

'Oh! What! I love me! Mrs Wintock! Jump up my way, who'd be thought it!—I'll do it! do more! Glad to see you, and thank you kindly,' and he took her tiny hand in both his great iron clamps, and moved it up and down, as if he were slowly playing a pump in the flesh. She started up, and then she saw the hostess, who had been which led into the yard. 'Ben!' he shouted, 'take that tin mine out again, for a rub down and feel her well! Lady and gentleman wait a moment!' and he went on again.

It was a lucky hit, and turning off from the high road, for the landlady's pet to have in a man of such a servant of Mrs Wintock's parents, who had lived with them first when quite a girl, had grown to a manhood in their service, and afterwards married a countess's daughter, not very unkindred partner. The man was handsome, and had received from his dear young mistress, as she still fondly termed her, and who a special attendant she had been, now best great friend, and she was most a friend in her kind attentions to us both, though it was evident that her curiosity was excited by the highest pitch by Mrs Wintock's sudden appearance at such a time, alone, in such company as mine, and above all in such strange attire.

'We've been housed for the rest of this night, my dear, and our hostess, as pressing his glass to drink the young lady's very good health, has glared up at the old-fashioned blind-brother suspended over the mantel-piece, and to which was appended a card with 'London' scribbled upon in legible characters. 'I shall like to see any little half-down on 'em to get you out of Bob Simpson's house! I'd make 'em—I'd make 'em!—' But here the action of his hand did not keep pace with the warmth of his feelings, and he was at a loss for a simile. 'Ah!' he blurted out at last, 'I'd make every one on 'em grin like a monkey with his head on a chopping-block!'

'Blessed my worthy friend, you're a Briton to the bone,' I replied, grasping his hand. 'Once safe in London, we do not fear. It is

the getting there. I don't think it likely we shall be traced till daylight. Then no doubt the Wintocks will be on the alert, and scour the neighbourhood far and near. A thousand unlucky chances may happen to bring us together, or they may even now have procured fresh horses and proceeded to Reading, and intercept us when we arrive in the morning, as we enter the suburbs.'

'Now, listen to me a minute, Bob,' interrupted his better half. 'It is only five miles across country by the byroads to Slough station [This I did not previously know]. The train passes through on its way to London about eight in the morning. I will lend Mrs Wintock another dress and a bonnet and cloak. You let Mr Meredith hire your loose gig, and the lord himself hummed the counsel that you drove to market in. It is too large for him, but we can easily put it. Ralph shall drive the pony and cut over with them the first thing in the morning, so as to be in good time. He needs to know nothing. As soon as this is fairly on the road, let him start with the mare and gallop for Thistle-leigh Hill. It won't do for them to be found on our premises, that might get us into an awkward way. Should he meet any of the Wintock people on the road, he can speak the truth, and say that a lady and gentleman left them here to night, desiring them to be sent back in the morning. And if not, let him drive them on to the Hall, and leave them in the yard with the same message. Tomorrow being market day, he is sure to get a lift put of this way back at night.'

Shortly after settling our plan of action, we retired to our several rooms, but only for a short space, for we were called upon before daylight. Bob and his spouse insisted upon giving up their bed to Mrs Wintock, whilst I lay down in a spare one.

Punctual to the minutes agreed upon, Ralph was at the door with the pony and cut, and we took a careful and affectionate leave of our host and his wife. We reached Slough just in time to catch the train, and by noon we were within the precincts of the metropolis.

## SNAKES AND SNAKE LIFE

There cannot be the shadow of a doubt that snakes form a group of animals which do not occupy a favorable or elevated place in the estimation of the public. Indeed, the reverse position, that which regards them as a source of unloveliness and poisonous repulsion, more accords with the popular verdict regarding these animals. Poetry, too, has lent its aid and influence in instilling feelings of unfriendly character towards these reptiles. But we know that poetry is not always true to nature, and it may be sufficient to add that in the present instance poetry has simply followed the popular lead.

The appearance of a handsome volume—*Snakes, Characteristics and Wonders of Serpent-life*, by Catherine Hopky (Griffith and Farrer, London)—devoted to an exposition of the wondrous ways and works of serpent-existence, and the fact that the volume

in question has been written by a lady who for many years has taken a deep and practical interest in snake life, must, either be viewed with a high degree of interest by naturalists and popular observers alike. It is of course an old adage that one man's meat may be another's poison, and of intellectual studies it may also be said that the dislike of one person may be the delight of another.

To zoologists, and to those who have learned something of the chain with which the observation of living nature is at all times surrounded, the family of snakes has always presented from its objects for study. Hence we must be very careful of assuming that prevailing prejudices, or popular ideas regarding serpents, are to be esteemed correct. Indeed, so far from this, the case, that even groups of animals and plants which to the popular or uninitiated eye would present no phase worthy of a moment's study, are found to them with an interest that may endure a lifetime. The fungi that grow by the wayside, the lichens on the wall, the animalcules that people our ponds and ditches—each and all of these and many allied groups of plants, have afforded intense delights to hundreds of observers who have learned the delights of nature study. In a similar way we do not learn to recognize that the disgusting snake is in a field of study, which, either in respect of its curious anatomy or of its interest, is second to none in the range of the natural subjects. And Miss Hopley's volume only serves to reinforce this latter conclusion. Instead of being, merely so, it is a well up of interesting and venomous elements, one influence shows us that in the realm of snake life, there are features of the deepest interest to those who care to learn. It will therefore prove one of the most important results of the publication of this volume, if it may be enabled, by Miss Hopley's aid, to study some of the phases of snake life, and to learn some of the principles which such a study is well calculated to teach.

A serpent is in reality a highly wondrous piece of natural mechanism. If we regard for a moment the lithic flexible spine, the ribs which on it, sit in a bicarbonyl, but in the great scales of the lower surface of the body, the beautifully adjusted scales covering the prone up status in those species in which it is developed, and the muscular layers through which serpent movements are effected, we cannot fail to see that we are viewing one of nature's "strong fellows" and one of the most interesting of the children of life. Taking even the tongue of the snake, to the examination of which Miss Hopley devotes no fewer than three chapters of her book, it is astonishing to find the amount of popular misconception which prevails regarding the nature of this organ. Persons who see a snake in a reptile house, are a welcome to see, and the thick, black, forked organ, which whips in and out of the snake's mouth as it moves about, as the "fang," "sting," or "poison-dart" of the animal—ignorant of the fact that no snake can sting. Now, we can only see the poison fangs—which in all snakes that possess them are situated in the upper jaw—when the mouth of the snake

is opened wide. The forked organ that is continually pressing out from the mouth and which is as rapidly withdrawn, is the animal's tongue. Yet hundreds of persons visit zoological gardens, and learn them, under the impression that they have seen the creature's "sting."

The tongue of the snake is in itself a very beautifully constructed organ. That it is as an organ of touch, few, if any, realize, and from its soft sensitive structure, it would seem to be admirably adapted for this tactile office.

Situated near the tongue, is the glottis or opening of the windpipe of the snake. The windpipe, as every reader knows, is the road to the lungs. Snakes as a rule have only one of these two lungs well developed, the second lung remaining in a rudimentary condition. Miss Hopley tells us that on one occasion she was watching a large python at the Zoological Gardens swallowing a duck which had just killed, when she was struck by an singular something peeping on bringing it in the side of the snake's mouth. It looked like a kind of tube or pipe, about an inch and a half or two inches of which were visible. The python had either an snake and hold of the duck, having begun at the breast with the neck doubled back, the head forming some temporary impediment to the progress of the jaws upon the prey. So the strange protrusion gave one a "sort of turn" and a shudder. It looked as if it might be some part of the crushed bird, and then when it had the appearance of a most unusual arrangement, and another shudder swept over me as the protrusion itself that the snake had ruptured its throat in some way.

Reflecting on the curious phenomenon which the discovery of the snake had brought to light she recalled that in a game, which she had seen, as a child, in process of being prepared by the cook, a similar structure was used. The remembrance of this fact awoke our enthusiasm in her search after the cause of the phenomenon in question. The keeper informed her that he had often observed the structure which had excited Miss Hopley's attention. In pursuit, let us express the regret that "keepers" are not instructed in natural history, elementary anatomy, and physiology. The valuable nature of such an education would soon be felt in the number of interesting observations on the animals under their charge which keepers would, even in the rudiments of natural science, be enabled to make. So our author, in consulting scientific books, soon found that the extension of the snake's windpipe in its upper part, was by no means an occurrence unknown to naturalists. Professor Owen remarks the fact, and all comparative anatomists know, that the trachea of the snake's windpipe, in its upper part, is so loosely connected, that this important breathing tube can be made to project, and thus freely communicate with the lungs while the creature's mouth and throat are gorged with food. The incident we have quoted goes to show that Miss Hopley's observations were not of a high order. Indeed from such a loss of observing nature and life, it may be said the best results in natural science often spring.

A perusal of the headings of the chapters in Miss Hopley's book serves to show how varied

are her studies of the serpent tribes. She has a very curious chapter on the 'suits of snakes,' and shows us therein how different are the characters which the candid region of serpents may exhibit. The popular reader will undoubtedly turn with great interest to read what Mrs. Hopple has to say about 'water snakes' and 'sea snakes' at large. In the Indian Ocean reside the curious sea-snakes which are highly venomous, and which possess flattened tails serving as a propelling apparatus. But many land snakes swim with ease and grace. Adders are not unfrequently seen swimming from one island to another on our Scottish lakes. We have seen the common British Ringed Snake (*Tropidonotus natrix*) swim with rapidity after an unfortunate frog which had contrived to obtain a brief respite, but which was seized and devoured in a very short space of time. Even the big pythons and anacondas, which crush their prey in their great coils, swim with apparent ease. Very curious must have been the experience of a Captain Pitblair of the steamship *Mexico*, who, as quoted by Mrs. Hopple from an American newspaper, stated that he had passed through 'a tangled mass of snakes' off the Tortuga Islands, at the entrance to the Gulf of Mexico. These snakes are described as having been 'of all sizes, from the ordinary green water-snake of two feet long, to monstrous, gramine "sea-serpents" of fourteen feet in length.' We are certainly inclined to agree with Mrs. Hopple that such a shoal of snakes must have constituted simply a mass of those reptiles which had been drifted out to sea on land-wood by some river flood or 'spate.'

The 'great serpent,' whose annal appears and is elucidated with particularity, receives full and complete justice from Mrs. Hopple. We are glad to find our authorities in the side of those naturalists who maintain that there is no general impossibility in the doctrine that great marine snakes may and do exist. In support of marine snakes we may find the explanation of many of the marine appearances which have been authenticated by the acts of credible witnesses. Mrs. Hopple takes, after supposing this theory to be correct, 'How long would the person stung of such a reptile live?' But there seems no need to make the existence or absence of poisonous power a question. What we desire to know is, 'What is the sea-serpent?' With the plain talk before us of endeavouring to find a natural solution of this query, before rushing into the clouds, it would seem that those zoologists who have in the huge development of marine snakes, possess a distinct advantage over all other thinkers. That snail-fishes, some of which measure thirty or forty feet in length inclusive of their 'tails,' are now known in plenty. A few years ago, such animals were believed to have been evolved from the little brim of Victor Hugo, who makes a giant octopus the nucleus of vengeance in his novel, the *Trouble of the Sea*. It is not too much to say that with the evidence of jaw and recent discoveries in cuttlefish life before us, we should at least be very cautious in denying the possibility and probability of giant sea-snakes being also man-bred amongst the fumes of the ocean.

Only about one fifth of all known species of snakes are possessed of poison fangs, a topic with which Mrs. Hopple deals in a highly entertaining

manner; but though comparatively few snakes possess poison fangs, some of the so-called 'harmless' species, such as the huge pythons and anacondas, become quite as dangerous from their power of crushing their prey by means of their huge and powerful bodies. Mrs. Hopple satisfactorily disposes of the old idea that these great snakes 'licked' their prey over before swallowing it. The tongue of a snake is never adapted for 'licking,' being, as we have seen, a lithic, rounded organ. The poison glands of snakes are modified 'salivary glands'—that is to say, they are not new and special structures, but modifications of organs which other animals and reptiles possess. It is a notable fact, that as in a poisonous snake the secretion of these glands is permanently venomous, in a 'mad' dog the saliva becomes temporarily poisonous; and it is well known that the bite of an enraged human being may be most difficult of healing, owing to the apparently violent character which the saliva acquires. We thus see that one and the same organ and secretion appears to become modified for poisoning properties and functions in very different groups of animals. The rationale of snake poison in its action on other animals appears to consist in its paralyzing effect upon the nervous system and in its effects on the circulation of the blood. It would appear that it acts by preventing the absorption into the blood of the oxygen gas we breathe, and which is a vital necessity for us and for all animals.

Amidst with two poison fangs in the upper jaw, the bite of certain foreign kinds is dangerous, and even fatal, in Great Britain, the viper or adder is happily the only venomous species. The remedies which have been proposed for snake-bite are of course very numerous, but Mrs. Hopple is probably right in following Dr. Seveling when she asserts that, as the poisons of different snakes vary in their effects, it is hopeless to look for any one specific for their varied bites. But it is impossible that underlying the variations in the effects of the venom, there may exist a common type of structure. For our own part, we should like to hear of Comely's Fluid (or permanganate of potash) having a wider trial in snake-bite than has yet been accorded it. Injected into the veins, this fluid appears to counteract the effects of the less deadly kinds of venom in a marvellous degree. Possibly it does so, because it throws off oxygen in large quantities, and may thus neutralize the effect of the snake poison just noted. But the difficulties and dangers of research in such a field are numberless, and there are few persons who, like Dr. Seveling, are bold enough to risk being bitten and to experiment on their own persons on the remedies they deem most efficacious for snake-bite.

In Mrs. Hopple's previous paper, the general reader will find a mass of information regarding serpents and their locally wonderful history. Stories like these dwell in the volume before us, readers good service. The cause of science, in so far as they encourage observation and turn the faculties in the work of noting facts, and correlating ideas. But of all, it is in the study of living nature that the poetical canyons may be sought and found. What of poetry Wordsworth found in nature, and what of humaning Ample discovered in his studies,

may be found in some degree at least by every earnest mind that approaches the fields of animal and plant life. A thousand wandering people the last, a museum of curiosities finds a home in the water drop, and the pleasure derived from a search in nature's fields is one that no accident of life can mar, and no misfortune of existence take away.

## THE STORY OF JOHNNIE ELLIOT, THE PILLAR

It is the lonely and rarely visited buryard of the parish known as Lillikham, in Dorsetshire, and among the little hills of that district is a rough hillside grave, at the head of which stands a pillar of stone, on which may be read the following inscription:

'In Memory of JOHN ELLIOT, Poet, a young man much in years of age, who came from the neighbourhood of Basing, in Northampton, and travelling in company with a man of the name of James Gordon, and to have come from Mayo, was barbarously murdered by him at Woodhill, on the farm of Upper Cusack, on the 11th day of November 1820.

'After the greatest exertions on the part of Sir Thomas Kirkpatrick of Clowburn, Bart., Sheriff of the county, the Honorable Captain William Napier of Thirlestoun, and many others, the above named James Gordon was apprehended at Narn, and brought to Dorchester, where, after an interesting trial, he was sentenced, and executed on the 6th day of June 1821.

'The inhabitants of Lillikham, in order to convey to future ages their abhorrence of a crime which was attended with peculiar aggravation and their veneration for those laws which permit with equal solicitude the murders of a poor friendless stranger as of a peer of the realm, have erected this stone, 1st of September 1821.

Some years ago, the circumstances attending the murder of the lad Elliot, together with those which led to the capture, trial, and conviction of his murderer, were repeated to me by a gentleman intimately acquainted with the matter, and as those circumstances may not be generally known or remembered, we venture now to narrate the story.

John Elliot, whose remains lie buried in the old buryard of the wild and thinly populated parish of Lillikham, was born at Basing, near Dorchester on Tuesday. His parents were poor, but respectable, and had previously lost by death one or more of their children. Their last-born was a sickly lad, weak in body as well as mind, but good and gentle to his parents, to whom this double weakness seemed to have indicated his doom. As Johnnie advanced in years, his health did not improve, and his parents were advised by a neighbouring medical man to endeavour to obtain for him some out-of-door employment, which, without being too hard, would at the same time afford him plenty of fresh air.

The parents were very reluctant to part with their sickly child, but finding that the boy was

quite unfit for regular manual labour, and being told by the doctor that outdoor exercise would alone give him a chance of life, they finally resolved on purchasing a colt intended for Johnnie as a small pack, and sending him to a pillar in Dorsetshire. In those days, this business was much more common than at present, many of those engaged in it had their regular bits in the country districts, where the inhabitants not only depended almost entirely on the pillar for their groceries, hardware, drapery, &c., but also for their supply of news and literature. John Elliot's parents did not anticipate that their boy would make such a fortune as many others had done in this trade, but they hoped that as an independent merchant he might in some measure lessen the expense of maintaining him in his ordinary life.

Equipped with a small self-painted box containing, in course of the usual description, Johnnie had made a rapid short journey among the neighbouring hills, when, at the time of my story, he determined to penetrate the wilds of Lillikham, and cross the hills to Moffat Water, intending to return home by Aunrill's.

On the 11th of November, the lad arrived at Woodhill, in the parish of Cusack, where he was he pitifully received by a farmer named Thomas Lamb. As he had Elliot received him well of his pack and consequently to make himself comfortable in the farmer's warm kitchen, when there came a second visitor, also an applicant for shelter. This was unhesitatingly granted, as usual with the custom of the time, a custom which would present itself of hospitality to no one. The new comer was an Irishman, who, from the description all round given of him, could not have been otherwise in appearance. He was short in stature, of a swarthy but fine cast, of which the sight was good, and his pitifully

poor, and as he with a remarkable temper, peculiarities which did not seem to improve a man's position, however they may serve to improve it up or rather. In spite of these blunders, the new arrival, who gave the name of Gordon, was made welcome to a share of the evening meal, and afterwards to plenty of clean dry straw in the byre or cowhouse, which latter place he shared as a sleeping place with Johnnie Elliot. The next day being Sunday, both Elliot and Gordon remained at Woodhill, continuing their journey on the following Monday morning.

It had become evident, from the conversation on the Saturday night, that Elliot and Gordon were up to that time complete strangers to each other, and it was believed that during the halt on the Sunday, the Irishman had by some means ingratiated himself into the kindly heart of the weak pillar boy, and that Gordon, under promise of showing the lad the most direct route of Lillikham, had accompanied him on his journey on the Monday morning. These two companions, the man with the marked and unpleasant features, and the lad with the conspicuous red box slung across his shoulders, were met by several individuals on the road between Woodhill and Cusack, at which latter place they arrived on the evening of Monday the 13th of November. Here they stopped and slept, and started again together from Cusack on Tuesday morning the 14th, apparently with the intention of finding their way across the hills to Moffat Water.

\* Thus on the tombstone, though the Clowburn family name is usually written Kirkpatrick.

It is not known whether Gordon had from the first determined on the murder of his companion, it is perhaps more likely that, believing the red box to contain property of greater value than it in reality did—as a matter of fact the lead stock in trade was not of more than a few shillings' value—Gordon determined to poison himself of it at any cost, and finding that secrecy was a very important factor in the robbery, he may have finally decided upon the murder of the boy. Under pretence that he knew a direct route across the hills by an unfrequented path, very much shorter than that usually followed, and which would take them past the house of a gentleman of the name of Napier, whose they were sure of obtaining food and shelter for the night, Gordon persuaded the boy to accompany him to a spot called Steel bush cleft, on a farm of Upper Cawock. What happened at that place can only be partly conjectured, but there, it all events, on the following Sunday, was found the body of poor Johnnie Elliot, lately murdered. It was first discovered by William Glendinning, son of the tenant of the farm of Upper Cawock, who came upon it by the merest accident, for the body lay on a most unfrequented part of the moor, across which there did not even run so much as a footpath. On examination of the remains, it appeared there was a cut or contusion on the chin, a cut above the right eye, and a great many wounds about the back of the head. Both Glendinning, father and son, examined the body in that of a pellar fil who, in company with a man, had visited the farm of Upper Cawock. They also noticed in the mud near where the boy's body was found the prints of heavy clogs strongly bound with iron, shod on the heels with the same metal, and with a peculiarity in the two heel plate marks, that of the one clog being circular, whilst that of the other was horseshoe shaped. It further appeared that both father and son had noticed this peculiarity in the clogs worn by the man who had visited the farm of Upper Cawock in company with the pellar boy.

The conclusion arrived at by the doctor and others in the neighbourhood was, that the poor lad had died from the effects of severe blows inflicted on the back of his head with some blunt instrument, and suspicion as to the perpetrator naturally attached itself to the Irishman Gordon, as being the last person seen in the boy's company.

On the day on which the body of John Elliot was interred in Ekeddenmair kirkyard, William Glendinning happened again, in company with a shepherd, to be in the vicinity of the scene of the murder, when they came upon a pair of clogs. These they did not remove, but at once returned to the farm and reported the matter to the elder Glendinning. Dr Graham was sent for, and he, in company with the elder Glendinning, proceeded to the spot, and brought away the clogs, which the latter recognised as those worn by the pellar when he had visited the farm of Upper Cawock.

Information having been given to the sheriff, the body of Elliot was disinterred, and again examined by two surgeons. These gentlemen were both of opinion that the wounds on Elliot's head had been inflicted by an instrument not

very sharp, such as the iron hoop of a clog, and having applied the forepart of one of the clogs found to a semicircular wound on the back part of the head of the deceased, they found it to fit exactly. The clogs in question being those believed to be worn by the deceased pellar, it was inferred that he may have sat down to remove, for some purpose or other, the clogs from his feet, when the murderer seized upon one of them as a weapon of assault. At least, there remained little doubt that whoever had committed the murder, had held one of the poisonous clogs by the heel, and had beaten the poor boy on the head until his was extinct, that the murderer had then dropped the clogs on the spot where they were found, and after rifling the lad's box, and keeping it in his possession for a day or two, had flung it into a small stream on the road to Strick, where it was found a short time afterwards.

All the circumstances attending the boy's death seemed to point to the Irishman Gordon as the murderer, and an advertisement was published in a local paper describing Gordon's appearance and offering a reward for his apprehension.

Time went on, no clue had been discovered which might lead to the murderer of Johnnie Elliot, nor had anything been heard of the Irishman Gordon, who, it was supposed, had left the country. The horrible death of the poor pellar boy on Ekeddenmair was becoming an event of the past, which would in time be soon forgotten, when the remarkable capture of the criminal in the manner we are about to relate took place. An agent travelling for some firm in the north, happened to be in the town of Naam on a pouring wet day. He had traversed his business, and was apparently at a loss how to get through the remainder of the dreary afternoon. The traveller's room in the inn in which the agent was staying, was upstairs, and he had cut out to the market place. Hearing the bell, the agent in despair asked whether he could be supplied with any sort of book or newspaper, and after some delay, an old copy of the *Dumfriess Courier*, which by chance had been left behind by some former traveller, was produced, and handed to the agent, who seated himself near the window and began to study the old, but to him in lack of a fire, still interesting paper. Coming at last to the fourth page, the advertisement short, he read as follows.

Dumfries, December 12, 1880

Whereas the dead body of a young man apparently about sixteen years of age, who had travelled the country as a chimney, was on Sunday afternoon, 26th day of November current, found about two miles to the north of Upper Cawock, and about one mile from Strick Park, both in the parish of Ekeddenmair, in the county of Dumfries, and from the number of wounds upon his head, there is every reason to believe he had been murdered about eight days ago. The deceased wore a dark green corduroy jacket and waistcoat, dark jean trousers, and a bunnet. The person who was last seen in company with the deceased, and who has not been heard of, spoke the Irish accent, was of low stature, middle age, dark complexion, much pitted with the smallpox,

when the magnificent carved screen which separated the Chancery Court from the rest was removed.

The appearance presented by Westminster Hall, with the judges arrayed in all the majesty of the law, sitting at its further end, along which was placed a marble bench, upon which the king in person occasionally took his seat, is well depicted in the well-known drawing by Gravelot, as well as in many another well authenticated print. The scene was unique, and to our senses inconceivable. All the courts were held at the upper end of the Hall, facing the great door, the Chancery Court, as we have stated, being partitioned off from the rest by a screen. Each court was covered by a canopy, and was contained in at the sides. The roof of the Hall was a bazaar for the sale of books, fruit, flowers, and millinery, in which the vendors showed rivalry as keen as that of the opposing litigants higher up the Hall. By the increasing pressure of business, the courts were at last driven to seek better accommodation, and about sixty years ago, the building, which has just been demolished, was designed by Sir John Soane, and the judges shortly afterwards removed from the Hall with all the pomp and circumstance of law. As a market place too, Westminster Hall has since that time gradually lost its glory, and at the commencement of the present year, the only signs remaining of its grandeur were in such were two old fashioned fruit stalls provided over by two equally old fashioned Hicks, whose occupation was to supply buns and ginger beer.

And so the 'old courts' were built, and after centuries of legal and constitutional struggle in Westminster Hall, its history as a court of law was for ever closed. Sir John Soane's courts were at best little more than a makeshift. They were stuffy, badly arranged, hideously decorated, and utterly inadequate for their purpose. They were the result of necessity, and were designed without any provision for the future. Very soon, new courts had to be built in Lincoln's Inn for the Chancery judges (who have since not parted from their Common Law brethren) until they have again been brought together by the building of the new temple of justice opened a few weeks ago. Even after this migration, the courts at Westminster proved inadequate for the Common Law business, and within ten years from their building, an agitation arose, which waxed ever greater, until it culminated in the scheme for the lumping together of all the courts under one roof, which has since been carried out. The old courts have thus proved to be but a link between the glories of legal history of Westminster Hall and the future of the Royal Courts of Justice. 'Rafus Hall' has been for ever rendered famous by the judgments of such men as Brougham, Eldon, Mansfield, Coke, and Hale, as well as for such historical trials as those of Sir Thomas More, Wilkes, and Warren Hastings. The 'old courts' have also been later the scene of historical events, amongst which may be mentioned the remarkable Tichborne trial, which is still fresh in the memory, and of Arthur Orton's subsequent indictment for and conviction of perjury, and their short history only closed on last Christmas Eve with a trial of a nature unprecedented in more ways than one, a trial which converted the Court of

Exchequer into a sculpture gallery, which lasted—including the vacation—from June till after the close of the Michaelmas sittings, and which resulted in the award of enormous damages in an action for libel.

With the demolition of the 'old courts' expire several of the old quaint customs, which, though of reasonable origin, have for long outlived their reason *à dire*. Amongst these are the offices of 'Tubman' and 'Postman,' held by two barristers, originally appointed by the Lord Chief Baron to their places in the Court of Exchequer, as presidents of the standard measures of capacity and length. For long, these offices have merely entitled their holders to precedence in the court, and now they have for ever disappeared. The old custom of 'fagot chopping' was also in force in the old court. It was a symbolical punishment in the same court by the same address on the occasion of the presentation of the shrieves of London and Middlesex. Gradually tending, the way of other old customs, the chipping of a fagot 'did survive for the tenants' twenty years ago, and the custom has now altogether vanished. It remains to be seen whether another time honoured custom—that of the Lord Mayor's visit to the courts with his retinue on each successive 9th of November—will perish with the migration of the judges to the new, though it may be interpreted that if the custom does survive, some death in the route of the 'show' will probably have to be met.

Thus, after a short history of less than sixty years' duration, have the 'old courts' utterly disappeared. They have served their purpose, and few people will regret the demolition of the miserably built house which, hidden in thanksgiving, did much to obscure the beauty of the grand old Hall of Justice. There is now a central place for the trial of all actions and matters brought before the High Court of Justice, and as long as the old room of legal strife at Westminster will have given place to the bloom of a London flower garden!

# A MODERN MADRIGAL

Come, for the birds are here in the spring,  
And the hum's first bleat is heard in the mead,  
Come, be Phyllis and I'll be Coryn,  
Though flocks we have none to fold or feed.

Orme fit a ramble down through the dingle,  
For Spring has taken the I with to I with,  
Leave the cuckoo to chirp by the mile,  
And forth with me to the arbut's side.

Lo! how the dew has put from off her  
Her virgin tunic of Winter white,  
And hangs in the open of the Spring, her lover,  
Who sings her a garland of flowers and light.

Hark how the lark in his first vespers  
Fills heaven with love songs, hovering on high,  
Treat to us for the Spring's intention,  
Treat to the morn for a stormy sky.

I know the meadow for daffodownilies,  
And the heart of the cow is purple and gold,  
It'll be Coryn, and you'll be Phyllis,  
Springs to day are as sweet as of old.

## VENICE IN CARNIVAL

Our inhabitants had told us that the spirit of Carnival was as dead in Venice as were the majesties and glories of the city, lonely, old palaces on the brink of the Grand Canal, so that we were prepared to be disappointed in a sight of which we had heard and read so much all our lives.

'But,' said one of our informants—that fine-headed old fellow who during the summer months sits to scores of painters as an Apostle or a Doge, but who in winter time is reduced to haunting the gondola landing stage opposite Saint Mark's, pulling in the craft with his black hook, and hailing forth his graying old cap for copper—'it may be better this year, for all the prospects of the booths and shows are to go to the poor people who have been washed out of their homes by the inundations in the north.'

At any rate, we resolved to see what fun there was, and, as the evening gun boomed from the arsenal by the church of San Giorgio Maggiore, we linked

the efforts of man were to be disappointing, nature at least did her best to favour the course of events, for a cloudless, deep blue, star-studded sky stretched overhead, and the 'Bora,' which had been blowing for some days, had given place to the gentlest of breezes, and a temperature very much milder than our own at home in early spring. Although the actual Carnival proceedings were not to commence until half past eight, a very considerable crowd had assembled under the piazzas in the great square and about the open spaces surrounding the ancient Palace of the Doges. Yet it was not the Carnival crowd which we had pictured to ourselves. We were of motley was very few and far between, and by far the greater proportion of promenaders were ordinary citizens, soldiers, country folk, peasant women—painted and powdered hideously, as in the Venetian fashion from highest to lowest—and onlookers like ourselves.

For some days previous, the students, who seem to take the lead in all public festivities in Italian

towns, had been busily engaged in rigging up booths with wood supplied to them gratis by the government upon the condition that they should do all the carpenter work themselves, and from an early hour of morning these booths had been doing a roaring trade.

As fortune favoured us, we were in duty bound to patronise each and every show at the modest outlay of one penny per head for each, not to mention the risk, of similar sums in lotteries, of which the principal feature seemed to be the tampering dishonestly of prizes obtainable and the very few prizes obtained, and the purchasing of all sorts of worthless gewgaws from voluble gentlemen in motley, who pounced upon us with eagle eyes, and who simply compelled us to buy by the process of thrusting the articles into our hands, and reminding us in pathetic tones that it was all for charity. As might have been expected, the penny worths which we saw in the booths were very dear at the price, but even if it was only to reward the energetic gentleman who roared and sang and danced and gesticulated on the platforms outside, it was worth the outlay. They were far more real caricatures in our eyes than the peepshows, the gymnastics, the collections of stuffed animals, the comic pictures, the broad farce acting to be seen within. Only men with the native, fervid warmth of the southern sun in their veins could have kept the game as they did, and they were amply rewarded for their headstrong exertions by the crowds of chattering, laughing people who streamed in and out incessantly.

The Venetian portion of the public entered thoroughly into the fun of these exhibitions, but the stolid peasantry from the great poultry-breeding farms on the mainland did not all seem to appreciate why they should pay a penny to look through a glass only to see the words 'Please, don't tell,' written on a card within, or why they should take the trouble to arrange themselves carefully in a chair to be photographed, and after much 'business,' be shown their own reflections in a piece of mirror.

Most assuredly, if there was little to be seen for a penny, there was plenty to be heard, for every booth had its big drums and French horns and cymbals, to which penny whistles, speaking, trumpets, and Jew-horns might in most cases be added. In fact, to make as much uproar as possible seemed to be the general object, and the more discordant the sounds, the better the public seemed to be pleased.

But the real fun of the fair was centered in the Place of Saint Mark, and in the quaint old illuminated clock showed the minutes gradually creeping along to the half hour after eight, the booths began to be deserted, and the human tide set for the square. Here a huge platform had been built for dancing, and all around it surged and swayed a dense crowd, a small proportion of which was fully dressed. As the great bell in the campanile tolled the half hour, a hundred gas-jets were lighted at its base, the crowd pressed to the entrances with their fifty costumes in their hands, and a really fine orchestra, dressed in half red and half white, struck up the famous and familiar *Carnaval de Venise*. The dark masses of people seem to leap suddenly into party colour d costumes, and we begin to think that, after all, Carnival is not so dead as it is reported, especially when we notice that amongst the crowd of dancers there are very few who have not either a costume or a mask. Evidently, aristocratic Venice does not patronise the dancing platform, for although the time kept is admirable, the performance of the steps is rudimentary in the extreme, and one can scarcely recognise the apparent grace and vigour with the refined drawing-rooms of such Venetian palaces as are not inhabited by Hebrew curia sellers. There seems, too, to be a lack of ladies, although gent men in outrageous female costume are plentiful enough, so that the spectacle of two big fellows whirling round and round with the most ingenuous faces imaginable is very common.

Meanwhile, the strains of the band have tended to swell the outside crowd immensely, and it may be fully supposed that the whole of plebeian Venice is here present. We are not very much struck with the style of fun prevalent, and the chief impression we carry away is one of marvel that men of presumably reasoning powers can bring themselves down so nearly to the level of monkeys. The great joke seems to be for a group of men or women—sometimes it was hard to tell which was which—to surround a drunken old woman or a stray boy, to gibber, jabber, and groan, and to offer consolation in the shape of sweetmeats. Or they would invade the great *cassa*, the *Quadra*, or the *Aurora*, or *Florant's*, drinking up every one's beer, mixing free with stray hats and sticks, and generally turning things upside down. However, there was universal good humour and happiness, and we rather cry off instituting a comparison between their behaviour and that of an English crowd under similar circumstances. During the whole four evenings, and we were there until midnight upon each, we did not notice a single case of intoxication or misbehaviour, or hear a solitary angry expression used. Carnival levels all men, and actions which at other times would have produced fierce jabbering and possibly shilleto work, were upon these evenings treated with good-humour. Say—there were two excep-

tions to the general rule of good behaviour, and these were two firemen from an English ship in harbour, and they were just sober enough to be able to stand.

One very distinct evidence that Carnival is dying is that very few 'good' people don masks or play the fool. With the exception of a company of student Pierrots—of whom more anon—the disguised gentry seemed to be of very low degree, and this was palpable, not only from the tawdry nature of the garments worn, but from their style of fun. A Venetian rough is probably more refined than an English rough, but if he is given home, he will come out in his true colours just as clearly as a man of any other country. Occasionally we came across a really good costume or saw a bit of genuinely comic acting, but upon the whole the Carnival fun of lively Venice was very inferior to what we subsequently saw at stolid, phlegmatic Brise. To talk in a speaking flannel, to take people by surprise by suddenly lawling into their ears, to jump and dance frantically about, to blow tin trumpets, and wind watchman's rattles, seemed to comprise the notion of Carnival fun entertained by most of the makers. Allegorical designs, political and patriotic processions and effigies, were conspicuous by their absence, probably on account of the want of wheeled vehicles in Venice.

The traditional Englishman with his yellow whiskers, his projecting teeth, his tall white hat with the green veil, his umbrella and opera-glass, was of course represented, as was the English man, a hideous being, outrageously dressed. A quack doctor with his apothecary, a party of men dressed as giants, and some old ladies with huge coal-scuttle bonnets, created some amusement, but it seemed to us that the majority of spectators seemed to look upon the whole affair with pity and contempt, although it did afford them an excuse for taking many more turns round the piazza than they would ordinarily have done.

An Italian crowd is rather 'crisply' and very hot, and as the cereolas did not get going, we thought ourselves of a certain German restaurant famous for its beer, situated some little way from the centre of action. We were somewhat surprised to find all the lanes and alleys leading out of the square crowded with makers and spectators, and still more so to find that the restaurant itself was crammed to overflowing, and that such luxuries as a vacant table or chair had to be waited for and pounced upon when found. The waiter confidentially whispers to us that there will be fun presently. We are glad of this, and wait for it. At the expiration of ten minutes, there is a roar at the other end of the huge room, and a company of Pierrots, a dozen in number, make their way frantically up, chaffing, right and left, tipping a hat off here, drinking up a glass of beer there, stretching through tin horns under the direction of an admirably got-up individual with a white milk standard. These men are of a better class, for their white suits are of fine flannel, they have white kid gloves, and their feet are incased in dandy pumps. One of them is evidently an acquaintance or relative of an old lady who is sitting with her family at a table next to us. She beckons to him and whispers something in his

ear, nodding significantly towards us. The young fellow starts a scotch in his hand, and immediately the whole troupe, jumping over tables and chairs, surround us, jabbering away in horrible French and worse English, gesticulating, and expressing burlesque delight at seeing us. The result is that we are taken with bonbons and souvenir cards, and shake hands affectionately with each one. We could not help wondering whether solitary foreigners in the midst of a festive excited assembly of English students would have been treated with similarly marked courtesy and politeness.

From us they proceeded about the room, playing all sorts of jokes and antics, and creating roars of laughter wherever they went, and when they left the room, other troops of merrymen came in, and the same scenes were repeated, until the noise became so deafening, and the atmosphere so powerful, that we dashed out into the comparatively fresh air.

At midnight, when we gradually made our way towards the landing place, the fun was at its height, and long after we were ensconced in our bunks we could hear the sounds of shouting and music wafted across the water.

For four days this buffoonery was kept up. Upon the last day, Sunday, the first buy-the-races that had ever been held in Venice took place round the square. Although the racing was ludicrous in the extreme—and the performers were members of the considered to be crack Milan Club—the excitement of the English mob upon Epsom Downs during the race for the Derby is but as the effluence of a ginger beer bottle when compared with the excitement of the good people of Venice over these races. Men tore their hair, and cried and exulted, and shouted themselves hoarse over the various events, the winners of which seemed to be regarded as popular heroes for the time being, the nearest parallel to it which the writer can recall being the scene at Kewington Oval after the victory of the Australian cricket team over the London last year.

Thus ended the Venice Carnival of 1887. We saw very similar scenes enacted subsequently at Paris, Vienna, and Milan, but not until we arrived at Basel did we get a fair idea of a continental Carnival. Basel, however, does not come within the scope of this paper, so the writer may conclude, merely stating that although disappointing, we were enabled to see the Italian people under conditions not very frequently witnessed by English travellers, who, as a rule, choose the summer and autumn months for their exploration of the fascinating 'Queen of the Adriatic.'

## ONE FALSE, BOTH FAIR,

OR, A HARD KNOT

CHAPTER VIII.—ANOTHER VERSION.

LADY BARBARA was really pleased to see her nephew's direct friend beneath the roof that she had learned to think her own. Technically, of course, and in a legal point of view, it was the widow's, at least for his, and would then be at the disposal of the objectionable Dolly Montgomery, newly inducted into the Montgomery

of the clerk branch, and keeping up his new income as he might in the strictly untold revenue of the immensely Lancashire estates. But the Lady Barbara had been born at Leamington House, had resided there in July Parliament during the latter years of his invalid father, and might be expected for her, a line, herself, the typical Montgomery, as much as the melancholy mansion that had been born so full of life and light, and colour and joy and revelry. She made Arthur welcome, then, with an urbanity that she easily displayed, talking, pleasantly enough, of Egypt, that she had never seen, and London, of which she really did not know very much, regarding the society of that capital as she had ever done, as from the highest pinnacle of an iceberg, and listening assiduously to whatever Talbot had to say.

The other lady's behaviour was perplexing to Arthur, and would have been so to Lady Barbara, had that disguised damsel been able to study her companion's present demeanour by the light of previous experience. For a while she would be listless, brightly, still, and then, by a swift transition, the same sweet girl that he could remember her, when the flush came so quickly to her beautiful face, and her eye would brighten or grow sad it would. He recollected well how kind she had been to the poor tawny natives of the country that was her temporary home, and how he had seen her, with large-eyed Egyptian children clustering round her knee, and how strangely the little brotherly friendships had seemed to live the noble lady from Kensington. His own feelings, where she was concerned, were a thorn, yet. But he had begun, before Egypt was laid behind, to feel that Clara was very dear to him, and he had hoped that she might even be his wife. As for the pomp and state that surrounded her, he had it, as one might dislike to see a lovely rose bright by heavy settings of gold and jewels. But now, what a change had come over her!

'Her sister—Mrs. Core Carew—is the cause of all,' said Lady Barbara, in a lower voice, when the other lady was seated at a distant side table, writing a letter, which she had craved leave to write, according to the dictates of ordinary politeness. When a hostess cares much for a guest, she does not ask his leave to undisturb an epistle to somebody else, but Arthur was almost reconciled to the perplexing demeanour of her whom he loved, when that seemed to be a valid reason for the change. He, like others, had been struck by the astonishing likeness between the two sisters, who were, for the first time in their young lives, had been considered. To him there had appeared, always, a marked difference in character. Clara had been her own noble self, and Core Carew a charming, sweet-natured girl. How very great was the puzzle now!

'You were saying, Lady Barbara,' for the aristocratic spinner had sunk into a reverie, during which she kept her black brows closely, and looked like a maiden edition of Lady Macbeth, her shrewd narrow mind manifestly absorbed in some train of deep thought as to the honour or dishonour to accrue to the ancient House of Montgomery.

She responded to Talbot's words as the war-

home to the trumpet call 'Yes, I was speaking of Miss Carew—whom you may remember, I daresay.'

'I knew Miss Carew very well, she was always with her sister, Lady Loomister. I only wondered not to see her here to-day,' replied Arthur.

'You will never see her here,' was the answer of Lady Barbara—'never, unless she repents of her sinful scheme, or, unless, as I sometimes fear, her sister's weak indulgence.'—

'But, Lady Barbara,' broke in Arthur Talbot hotly, 'you forget a thousand pardons for interrupting you—that I am in total ignorance as to whatever may have occurred, or to what you allude. Can it be possible that Mrs Carew has—'

'Sir Pagan Carew!' announced the soft-tongued, unassuming person in solemn black whose duty it was to usher in visitors, and the strong-limbed, swarthy young baronet made his awkward entry.

'I forgot to tell you, I'm afraid, Lady Barbara, that's it,' he said, in his rough stammered way, as he touched Lady Barbara's cold finger—'Clare, dear, so glad of course. What an age it seems!' And the baronet bestowed a most fervent handshake on his sister, and would have kissed her, for there was a young brotherly kindness in his tone and in his eye, but he was too shy to do it before company. 'What an age it seems!' repeated Sir Pagan, seeming to hug the expression, his luck of the draw succumbed it, and then, catching sight of Talbot, whom he knew well, he took a dash at his hand in a muttering, 'Didn't know you had got back from Egypt—awfully pleased to see you old man!' And Sir Pagan finally did seem glad to see Arthur, whom he liked, and with whom he felt at home, for he was more comfortable in the society of men than of women.

'So good of you to come to me, Pagan,' said his sister, turning herself near the dark, shy, young man.

'Umph!' muttered the baronet, looking askance at Lady Barbara, who had done his very best to smile during the interview, and who now said, blandly enough, 'Indeed, Sir Pagan, you are very welcome here, and I have—we have—always wished to see you. I trust we shall persuade you to regard this as a second home, and to spare us some of your idle hours on your next account—By the bye, I hope you bring good news of Miss Carew.'

The baronet flushed pink to his very ears. 'I don't quite understand, she is pretty well,' he said.

Sir Pagan Carew was extremely embarrassed. He was one of those well-born gentlemen of whom Thackeray said, long ago, that they never enter a lady's drawing-room. The number of these young men augments very much in these modern days, when London teems more and more to become no single town, but a vast agglomeration of many Londons, an immense catharine wheel revolving with more or less of sparkle and glitter. There was much of good soil lying fallow, if the metaphor may be pardoned, in that rugged, honest nature. He was very true, too, to the uses of limited, and it was on his sister's account that he had

ventured now to so formidable a palace as Loomister House, known to be the den of so terrible a social dragon as Lady Barbara Montgomery.

'My sister is pretty well, dull for her, though, in Boston. Great deal of fun,' said Sir Pagan, and he really spoke as if he had been the humane but cold keeper of a private lunatic asylum, of which that sister of his had the misfortune to be an inmate.

'My darling—if I had her with me here!' was the low rejoinder to the mistress of Cavalier View, and Sir Pagan, who thought such an arrangement an eminently desirable one, glanced furtively at Lady Barbara, to see whether that dragon of old-fashioned aristocracy sanctioned the suggestion.

But Lady Barbara looked exceedingly grim. 'There is something to be extracted, and—excuse me, Sir Pagan—something to be repeated, before Miss Carew can be a welcome guest here.'

'Oh, upon my word, Lady Barbara,' blurted out the baronet, for the whole affair was a pun and a bewilderment to him.

'Of course, if you ask with her!—Lady Barbara began, in her slow dignified way.

'But I don't, begging your Ladyship's pardon,' interrupted the astonished Sir Pagan, 'I don't ask with anybody, and I wish with all my heart!—Put back the baronet noticed that Arthur Talbot—who probably felt uncomfortable in his present position as an auditor—had risen, bit his hand, and was about to take his leave. The devil of being left unprotected to the tender mercies of the awful Lady Barbara, overpowered Sir Pagan. Had he been a modern Aristonoxia, he could not have shown more punk fear of the dragon. 'I must be going, then,' he exclaimed nervously, as he scrambled from his chair—'Good bye, Clare.'

'I have seen nothing of you, brother,' returned the sister, with soft reproach, as she took his proffered hand.

'I'll come again, very, very soon—see you often, now you are in town,' qualified the baronet, prodigal of promises, now that he saw a chance of escape from his present predicament—'Good bye, Lady Barbara—no need!' And it was with a wave of one relief that Sir Pagan passed out at the gates. 'I should have a bit of some kind soon, if I lived in that—jail,' said the baronet bluntly to Talbot, as the two walked on side by side.

'Have very great and good houses, without company to cultivate them, are miserably alone, I dare say,' answered Arthur, smiling at the baronet's reluctance.

'Melancholy!' My own poor old barrack at Carew is a jovial place in comparison, and as for your house—Oakdene—it's a perfect howl of blues and miseries, whereas at Loomister, what do you call it, I had an ugly sensation of being buried before my time,' said Sir Pagan, who had hunted much in the New Forest, and had thus come to know Talbot, as a hospitable connoisseur of small means and good manners, fairly well—'Do you know, Talbot, I used to envy my sister her stroke of good luck—to hook a Masquise was luck. But I pity her now, almost as I do the other poor girl that lives with me in that bachelor den of mine.'

Arthur Talbot was full of curiosity, but you cannot much more easily ask questions as to a man's affairs than you can propound them as to a man's wife.

They were in Puccini's by this time, amidst the roar of voices and the roll of whisks, and all the myriad sounds that go to make up the hum of London.

'I am only at a West End hotel, the Grosvenor, for a few days,' Arthur said, in answer to an inquiry on his companion's part. 'You, I think, are in Euston Street still, Caw. I'll look you up, then.'

'Come to-morrow—to dinner, I mean—if you're not engaged—Awfully glad you're not. Meet some men. It's not often I ask any one, it seems, I am, but one must keep up one's old friends—This your way—this is mine. Don't forget, old man—Euston Street, till past eight.'

(He is continued.)

## ACTING ANIMALS

WHEN a linguist of the old school, strolling in a country town, complained of playing a quieter hour, a sympathising friend lamented that his living should happen to be there at the same time. 'Living,' exclaimed the linguist. 'I'll star against him anywhere, but who can star against twelve performing elephants?' Biped actors naturally have the same anxiety for their four-footed rivals as puerile Hydon felt for Gamal Tom Thumb. One popular player, however, owns to having good reason for entertaining kinder feelings for them. 'One memorable night,' says Mr Toole, 'I was destined to take part in a performance at Aschley's for the benefit of the veteran equestrian Cook, and while waiting for my turn, I took to walking in the back of the stage, to pass away the time. All was darkness and gloom. I heard the distant tramp of the horses below, but I could see nothing, and eventually lost my way. In trying to retrace my steps and to avoid a pitfall, I came across a wooden partition, which I thought would guide me to a safe retreat. Presently I found the ground beneath me slightly moving. I seized the edge of the partition, or I must have fallen heavily—I knew not where. Suddenly there came a flash of light from a passing lamp—a glimmer of hope to me—and I realised my position. I was standing on the back of a performing elephant, placed under the hayloft, into which I had wandered, and from which, but for the kindly creature, I must have fallen some fifteen or twenty feet into the open arena below, probably never to rise again.'

The sight-loving public have always taken so kindly to performing animals, that we may be sure the amusement seekers Queen Anne's time fully appreciated the little marmoset, from the First Indies, that danced the Chinese Rommle and performed several other pretty tricks, and very much applauded the plying horse, which, being told there was a warrant come to pass him into the service of the French King, fell so lame he could hardly set one foot before another, and thereupon knowing he must go if alive, threw himself down, with his legs stretched out stiff, and his tongue hanging out of his mouth, lying as if he were dead, until told to

rise and serve Queen Anne, when he jumped on his feet, and became 'extraordinary' brisk and cheerful.

Animal performers, be their parts ever so simple, are not always to be depended upon. An effect never contemplated by the composer of *Tosca* was produced one night at Covent Garden, thanks to a couple of animal experts. With the first note of the *grithers* song, the two gongs tethered to the rack began to blast most piteously, and in her own interest, Miss Marcella Costello hastened to set them free. One made a hasty and undignified exit, but the other, less bashful, made its way to the footlights, and marched upon delivering itself of a ludicrous solo, as unmelodious as the most violent rumour of the music of the future could hope to be.

Determined to put the *Fairy Thieves* upon the stage in as satisfactory a manner as possible, an enterprising Nevada manager provided Ah Baba with a real live mule to carry off the proceeds of his raid on the robbers' cave. Filled from lack of proper instruction, or from the perversity of his nature, that animal behaved as though the sole purpose of his presence was to prove he was no 'property' mule, for no sooner was he on the stage than he put his feet let down firmly and kicked, as only a mule knows how to do—sending the prompter into the orchestra, the callboy into the flies, and causing a general excitement without any regard to the stage direction. Having the stage to himself, he assumed his heels until he had kicked the cavern, the jaws of oil, and an expanse of forest, far into space, and utterly wrecked the *mise en scene*. That mule's first appearance was his last, although the spectators were so delighted with his spirited performance, that they wanted him to take a benefit, but the manager declined to give him a night.

According to the *Dance Tribune*, a purist lately distinguished itself at the Opera House there, the manager of which had borrowed it from a restaurant keeper. During the first act of *Old Hesperides*, the bird was quiet enough, but as soon as it had become accustomed to its novel surroundings, commenced to display its accomplishments, to the amusement of the audience and the dismay of the actors. 'Lamb chops or breaded veal?' screamed Poll, bringing forth a loud 'oh', to which the bird responded with 'But up, you make me tired.' 'Quit leaving the cook!' and a volley of oaths. An actress pushed the rope to the wings of the stage, to be used by the manager, and hurried to the property-room—the voice of the indignant purist gradually dying away in the distance, until the slamming of the door shut it out altogether, but not before the offender Poll had managed to remove by nipping the captor in the leg. A little later, the manager then addressed his treasurer 'Mr Howe, let it be understood once for all that hereafter no living wild beasts will be introduced on our stage.'

Perfect in their behaviour on the boards of the Wallace Theatre, Berlin, were two fine rams introduced in a spectacular piece at that house. When the drama had run its course, the manager took the rams home with him, and placed them in the kitchen for the night. It was his custom

to indulge in an early cup of coffee in bed, the duty of bringing it to him devolving upon his cook. Performing her usual office on the morning after the coming home of the rams, that hunc-dunary, forgetting all about the ram, left the kitchen door open behind her, and the curious creatures followed close upon her heels, until they passed into the drawing room, where they elected to stay. One side of the room was adorned with a splendid mirror reaching from floor to ceiling, and seeing themselves reflected therein, the rams lowered their horns and dashed at their fancied foes. Then came a crash, followed by another, as the startled woman dropped her tray with a shriek, which brought the manager on the scene in double quick time, to vent useless anathemas on the heads of the unconscious offenders.

Romeo, a clever elephant attached to Bolan-son & Co., proved a very troublesome customer when a passenger on board the *Golden Ocean* steamer. For the first two days he was kept chained on the fore-castle, and amused himself with the birds and brigs within reach of his trunk, tumbling them about without any consideration for the possible fragility of their contents, then, being removed out of harm's way, he turned his attention to some heavy cedar logs, finding great amusement in raising one up and letting it fall again, shaking the boat from stem to stern. To spoil his fun, Romeo was taken from the fore-castle to the interior of the boat, but his soon found mischief to do, jerking the bell wire running from the pilot house to the engine room. The first time he worked the wire, the engineer stopped the vessel. "What's the matter?" asked the pilot, through the speaking tube. "N' thing," responded the engineer. "What did you stop her for, then?" shouted the pilot. "Because you rang the bell." "I didn't ring." As he spoke, the bell sounded again, and the startled engineer caught Romeo in the act of jerking the wire, but there was no way of preventing him so amusing himself, and he kept up the titillation day and night, so that, at last, the pilot to signal the engineer through the speaking tube for the remainder of the trip.

Animals have now and again appeared on the stage without any arrangement for their so doing. Brevet Thornton saw a tragedy monarch dashed in his last moments, as he lay expiring on the carpet, by a dramatic critic of King Charles's ilk he called, who, jumping out of the stage box and flinging upon the hero's pillow, brought it off in his mouth, and deposited it safely on his mistress's lap. When Charles Keen was playing Richard III. at Exeter, just as he was getting the worst of the combat with his rival, his Newfoundland dog, watching the minute fray from the wings, thinking his master in danger, rushed on the stage, and dashing fiercely at the dismayed Richmond, put him to sudden and ignominious flight, and brought the tragedy to an unlooked-for end.

In Newell's opera *The Rakestriver of Hameln*, the most effective scene is that wherein the rats, in obedience to the magical spell, make their exodus from Hameln. On the first representation of *The Rakestriver* at the Dresden Opera House, this was so well managed, that the old cat of the establishment, busily regarding pro-

ceedings from her favourite corner at the side of the stage, was startled out of her placidity by the sudden appearance of a host of her natural enemies upon her own territory. Suddenly she sprang on the stage, and went for the army of 'property' rodents with a will, not to be daunted by overwhelming numbers. Her teeth, however, soon showed her what they were made of, and she retired majestically from the scene, but, in obedience to an apocryphal recall from the delighted audience, was brought back in the arms of a waiter, to receive the tribute of applause her courage and conduct deserved.

Manager Davidge did not scruple at snuffing off the pig that had helped to the Surrey treasury, but Mr. Tinty, the proprietor of an educated pig, exceedingly popular in Moscow, had more gratitude in his composition. Three rich merchants, determined upon enjoying an unusually expensive dish, offered Mr. Tinty three thousand roubles for his 'learned pig,' and after some demur, he handed the animal over and pocketed the money. The poor pig was intrusted to the handling of an eminent chef, and duly devoured. Next day, however, the walls of Moscow bore the familiar invitation to go and see Tinty's 'learned pig,' and that worthy was waited upon for an explanation. 'Gentlemen,' said he, 'at the last moment, I heard that you wanted the pig for dinner. I thought it very unbecomingly in me to take so large a sum for a ten-day old porker, so I got the very best that money could procure, and substituted it for the real one.'

However much such clever creatures may be valued by their owners, they are very liable to come to an untimely end. Barnum lost a rope-dancing ape, turning elephant very suddenly, the evil news being conveyed to him in a letter from one of his men, running, 'Mr. Barnum, one of the elephants is dead. He died of entom-bion of the brain.'—'Well,' was the showman's commentary, 'we mustn't touch elephants so much. Giving this animal such a stock of "entom-bion" has cost me ten thousand dollars, but he must have a few key-ones in orthography, as wants "entom-bion" on the brain.'

An infant piker, in training for appearing as a 'learned pig,' happening to mistake the learned bear belonging to the Brooklyn Dime Museum, by his continuous squeaking, was torn limb from limb, before any one could rescue him from his clutch. —A trained donkey was decorated by the bloodhounds of an Uncle Tom Combs-ton—probably the one which a Western critic had 'presented the finest bloodhounds and jack-asses ever collected in a single lot.'

A donkey, a pig, and a goose once exhibited great success at Birmingham in a pantomime, which, mainly by their admirable performance, ran until June. The season over, the manager took his company to Wolverhampton, and when he found business slackening there, sent his animal actors. They arrived two days before they were announced to appear, and were quar-tered underneath the stage, the donkey being tethered at the foot of a staircase, and the pig and goose allowed to run loose. Next morning the goose was missing, all that his porcine comrade had left of him being a few feathers. The following morning the donkey was found

dead. From teeth marks on his boots and hocks, it was surmised that the depraved pig had tormented him until he could endure its attentions no longer, when he had climbed the stairs, mounted to the small landing at the top, and fallen over on the other side. The rope by which he was tethered holding firmly, the poor man was strangled. ■ was too late. ■ changed the pace. The 'posters' had achieved their end, and in the evening an expectant crowd assembled. The pig, and the clown did their best, but at last the donkey and goose were called for, and the manager was compelled to come forward and tell the sad story of their untoward demise. Unfortunately, the gods would not accept the disappointment with a good grace. They were offered their money back, but nothing would content them but turning up the lances and flinging them into the pit. A fire light followed, the pig was squealing off the stage, and the curtain fell, not to rise again that night.

We will conclude these notes with a homely rhyme which has been sent us by Mr. Davis of Dublin, relating ■ the exploits of a donkey who can do some acting on his own account, and teach his tricks to a companion as well.

When you call me an Ass then you say I've no sense,  
But I fail to discover where lies ■ first noc  
And can show you a Donkey who's dead in most every sense,  
Giving proof he's no fool but both cunning and wise.  
To a firm in the County Kilkenny I bring  
All who question my statements—the price Silvergrey,  
And the owner, & Bowers my brother-in-law  
Who will touch all is true, and that he himself was—  
And not only he many others as well—  
The Donkey repeats all the facts from left  
For amusement. Nor shall I omit to relate  
With wit and skill its removal on all its sides the price,  
To let myself free. There is yet something more—  
With his mouth he was seen to sink the farm of  
Gretton wonder of all and which shows him no less,  
He is teaching his tricks to his class a group, all  
Which has proved in its power so I no doubt in time  
Will find his tutor to guide my whole rhyme,  
Which I forward to ■ may as they will see  
There is merit to warrant publicity.

## THE MAN IN POSSESSION.

IN TWO CHAPTERS.—CONCLUSION.

Once more in London, I speedily settled out and engaged a temporary lodging for Mrs. Wintock. Next, I proceeded to wait upon my chief, to whom I rendered a faithful account of what had transpired, and who, far from blaming me, was pleased ■ commend my conduct highly. I know the volunteer who always attacked his law business.

'Do you think, sir,' I asked respectfully, 'that I had better ■ to Mr. Wrightly, or can you advise me of any one better?'

'Wait on old Wrightly ■ once,' was his reply, 'highly pleased at my being his usual.' He is as sharp as a fence and as persistent as a leech.'

Jumping into the first cab I met, another half hour saw me in Mr. Wrightly's office.

I need not detail the steps which eventually led ■ the recovery of the greater part of Mrs. Wintock's property. Sufficient ■ state that the astute old lawyer ■ once understood her case, conducting it with a perseverance and skill

seldom surpassed, and that also, while matters were in progress, he very kindly and thoughtfully provided her with a safe situation, receiving her into his own house and family. At first, the Wintocks threatened proceedings against me on account of the maze and gig, but these they were soon glad to forget, for the shrewd old ■ attorney at once commenced the battle, and thus had much more important interests to engage than attention. It was, however, about two years before things were finally settled. During the early part of that time, I called once or twice, at his own request, to see Mrs. Wintock, and she had by degrees drawn from me much of my past history.

Long before the expiration of the two years alluded to I had, however, bidden farewell ■ my occupation as a buff, for one morning my chief called me aside. 'Wrightly,' said he, 'here is a note from Mr. Wrightly, requesting me to send you to him immediately.'

'Good morning, Mr. Wrightly,' said the latter, as I entered the little private room in his chambers in which he usually sat to receive clients. 'Take a chair. I want a word or two with you. I have been given to understand that you were formerly employed in the law. Is it so?'

I began to flush and stammer, for I could not for the life of me guess what was coming.

'Ah, well! I see, committed yourself. Never mind. Do you like your present vocation, client? Not particularly enthusiastic in it,' he continued, in his cheery, cheerful way of speaking. 'Very good. Glad of it.'

I bowed, for I had literally nothing to reply. 'Now, young man,' and he fixed his keen gray eyes suddenly upon me, 'I can perfectly comprehend a but limited inexperienced youth seeing his wild out, and afterwards reaping the bitter crop, too often throughout his life. But your conduct in Wintock's affair has given me a favorable impression of your character and disposition, and I am induced to hope that with the energy you evidently possess, you may yet accomplish better things—Stay!' he said, raising his hand, seeing that I was about to answer. 'Hear me out. I conclude, from the few scraps of your history which I have heard, that you have received a general education. Indeed, your man is makes that you have not always occupied your present position in society. Had you the opportunity of regaining your former status among your fellow men—on your word as a man, would you do you best? Return it?'

His words fell upon my ears clear, cold, and calm, yet so ludicrous as the ring ■ a silver bell I rang to my feet. The gorgeous sunshine was streaming with golden rays through the narrow window of that little room, tinting with hues of ■ rainbow even the pile of dirty deeds that lay ranged upon its shelves. I felt its loving warmth strike to my inmost heart, as I stood there before him with quivering lip, vainly struggling ■ force out the glad words ■ thank, that I could not come, for my emotion was too deep for utterance. 'Could it really be that there was yet one more chance for me of hope ■ life? for my present existence, passed in a low and degrading occupation, that I thoroughly hated, could not be turned back.'

Mr Wrightly perceived my agitation. 'Enough!' said he with a smile, and waving his hand. 'Sit down again, and compose yourself. Actions shall speak for you in the future. I like them better than words.—That is just at this time a vacancy in my office, the post is open to your acceptance. Fill it worthily, it is the first step on the ladder. In due time you may rise to competence—least, if not to eminence. Up, hit me, energy, and perseverance—you know the rest—these, no thanks. I owe you some recompense for humbling me a good cheat.

How my heart bounded within me as I left Mr Wrightly's presence! I could not revert the conclusion that Miss Wintock's representations had influenced him. Doubtless, she wished to repay me in some way for my services. What public offering could she present me, than the opportunity of reclaiming myself, and regaining my former social status?

'And John Meredith will prove himself not unworthy of her kinship!' I calmed, as I threw myself upon my couch for the night, to dream of the past, present, and probable future, mingled in indelible confusion, for amid the tempest of conflicting emotions, a calm hope had flashed in momentarily, like a brilliant meteor, upon my unclouded mind. I dared not be true to even to myself, for how encourage it? Vainly I tried to banish the remembrance of Miss Wintock from my mind. Mr Wrightly's assurance was a sad distance from his chambers. Some times I had sat upon him there, and occasionally saw her for in instant. He kindly grasp of the hand, with occasionally a few words of friendly inter-~~est~~ had served to feed and fan the flame that was smouldering in my breast, and yet I felt that my case was utterly hopeless, because of the gap between our relative social positions.

During Miss Wintock's stay at Mr Wrightly's, a Major (until he became a constant visitor) began to be whispered that so soon as her affairs were settled, he could be openly acknowledged as her accepted suitor. When first I heard the news, every faculty seemed for the moment paralyzed. Then I awoke to the depth and intensity of the feeling, I entertained for her. That night, in my chamber, I cut myself on the floor in a wild temp of of passion, grief, and despair.

A few weeks after the trial—which resulted in his favour—was over, it was generally reported among our circle that Miss Wintock would shortly leave Mr Wrightly's family for an establishment of her own in the country. I felt it was good for me that I should be so. My mind removed from mundane preoccupations, I hoped to be able to discuss equanimity and composure of mind. Happiness was not to be expected, for the marring of a joyful life was broken.

One morning I was in my accustomed place at the chambers, gloomily poring over a dead uninteresting to me by Mr Wrightly, when a perfumed billet was laid on my desk by one of the juniors. It ran thus:

'Miss Wintock presents her kindest compliments to Mr Meredith. Probably he is aware that she is about to leave town for Brinsford Hall the day after to-morrow. She would therefore be

pleased to see him any time this evening. She cannot help feeling rather surprised that he is the way late of her friends to congratulate her upon her good fortune.'

'Well, I'll go and have it over,' I soliloquized. 'Little does she guess the agony of mind to which it will subject me.'

I went punctually at the clock struck seven, I was ushered into the library. Miss Wintock and Mrs Wrightly were sitting together, each with a book. Miss Wrightly was chattering. But my every sense and feeling became absorbed and entranced in the contemplation of her friend. She had always appeared to me strikingly handsome even under the unfavourable circumstances of her captivity, but now, she looked me with the brilliance of her queenly beauty. Time, repose, communion with congenial spirits, had combined to develop her form and perfect her lovely face. She might have sat for a model in recent France.

'Good evening, Mr Meredith. I am so glad to see you once more before leaving London. But what a recent knight! We have neither heard nor seen anything of you since the day of our triumph.'

I murmured very confusedly something about not liking to intrude upon her.

'Oh, nonsense! You were not such a coward on a certain night which I shall ever well remember. And yet I have been very busy indeed, or I should have sent for you earlier. Now you will come, we must have a little chat. So, take a chair, and make yourself at home.'

I sat down, and we talked awhile, Miss Wrightly occasionally joining in the conversation. By degrees I overcame my embarrassment. We chatted of the past, of our hardships, sorrows, and of the trial, and then I took the opportunity of thanking her most gratefully for her interest with Mr Wrightly on my behalf.

She raised her delicate hand with an imperative gesture of displeasure. 'Mr Meredith, I do not wish to hear a word about that. You have only to thank your own noble conduct. I always felt, from the first moment you befriended me, that you were to be used as an attorney, a gentleman.'

Other desultory conversation followed, and soon afterwards I rose to take my leave.

'Stay one moment longer,' she requested, as she tripped across the room to a little cabinet. 'I have a task here for your acceptance, you must not go away without it.—There,' she added, as she placed in my hand a splendidly executed miniature of herself. 'You will not refuse to wear this as a memento of your services to me.'

I bent over it and kissed it fervently, and also the snow white hand that she placed in mine to bid me farewell.

'And now, Mr Meredith, good bye! Let me hear now and then of your welfare. You will perhaps occasionally have town for a few days' holiday. Whenever you may chime or choose to come in the neighbourhood of Brinsford Hall, remember I shall expect a call from you.—No, no excuses. I command it!' She spoke with a bewitching imperiousness that awed and fascinated me.

'Miss Wintock,' I murmured, 'I shall be most

happy—most delighted to—to, but perhaps—I feel—

Giving upon me for an instant with a fixed look of astonishment—'But perhaps what?' she asked

'Miss Wintock, I appreciate your kindness far more highly than any words of mine can express, but in fact, I do not trust myself—' is for me extremely painful to decline your kindly meant invitation, but it would be even more painful for me to accept it, and it is quite possible, I blushed out scarcely knowing what I said, 'that Mr. R. (nearly might not entirely approve of my doing so.'

Both ladies regarded me with looks of intense and puzzled wonder, as if they thought I was going distraught

'Myor (courtly)' each involuntarily repeated very slowly and in the same breath. The next moment both burst into a simultaneous peal of merriment, and Miss Wintock, with both hands to her face, to conceal her merriment, hurried out of the room. Miss Wintock was the first to receive her composure. For myself, I was completely confounded, and stood speechless

'Mr. Meredith' she gravely repeated, 'there is a serious matter, though I have been silly enough to laugh at it. What can Myor (courtly) have to do with your giving me a friendly call now and then it is my own conscience, if I choose to entertain you?'

'I—I thought that he had a right to—I have heard that you were—'

'Myor (Courtly) is the universal savior of Miss Wintock, the only who has just left the room, she quickly interrupted. 'What next?'

There was a nervousness unknown in her glance. It flashed up in my mind that she half expected my arrival. I lost all self-control. Out it came in a half-silencing torrent of words that would not be controlled. In the frenzy which shook me, I had taken her hand in mine, when she gave me one startled look, and with her feet raised, stood motionless in a statue, her eyes alternately fixing from crimson to the pillar of snow, and then as quickly flushing to the height of crimson again. I told her all—of the love and kindled which she bent over me by dim candle light in her dark prison chamber—how, through the long dreary months which had since elapsed, it had gathered intensity, until it had become the quintessence of my existence—how that, during the impossible full that passed between her station and mine, I had resolved to come and had her farewell, and then to see her no more, but to busy my mind within my heart for ever, and to see my burden as laid. I might flounder for an instant over the hand that cold me marble, still rested in my own. I turned it passionately to my lips, and was about to rush from the apartment, when a sudden darkness seemed to overtake her. But for my assistance she would have fallen to the floor

I was sobered in an instant, horrified at the consequences of my own impetuosity as I conveyed her to the sofa. I was about to ring the bell for assistance, when she languidly opened her eyes. 'Do not ring, at least for a minute or two, I shall be better presently—A little water'—pointing to the table

I hastened to comply, but my hand trembled

so violently that I could scarcely help her, as kneeling on one knee, I raised it to her lips. 'Oh!' I cried, 'forgive me, Miss Wintock, the alarm and pain I have caused you. I believed that intense terror in my excited manner and speech, communicated with anger at my effrontery, had caused her to swoon. I will summon Miss Wintock, and never intrude my hateful presence upon you again. Would that my tongue had been—'

She laid her hand gently on my arm. 'Do not speak, please, I cannot talk yet'

She sat for some minutes without moving or speaking, and with her eyes cast down. Presently, a few peevish drops began to steal gently from under the dark pencilled eyelashes. For my own part, I scarcely dared to breathe. At last the colour began slowly to tint her cheeks. Suddenly, she raised her hand from my arm, and with a great effort stood erect. 'John Meredith' she said, 'I know you to be brave, I believe you to be sincere. Tell me solemnly—was this your weak mind and soul, or only a mistaken feeling of enthusiasm in prating with a dead friend?'

'Dearest Miss Wintock, it was indeed my whole mind and soul, my—'

'Then take me to your heart, John! To my protection, that is all, as you have been my constant deliverer from worse than death

It was not till some time afterwards that I left the house. Miss Wintock did not return to the history, and we sat silently conversing of the future, the joyful present, and the happy future. At length the supper bell warned us that we must put and I laid myself away, once more to dream—but this time his fully—of Miss Wintock

A few months later we had a quiet dwelling in the metropolis. Mr. Wintock, flourishing as father, and his daughter as one of the birds of the air. But at that high my lively brain was reared with a hearty strain, the village burning out on me to meet and welcome her. Now and then had been appointed to the Hall, and there was a joyful special in the three days in the house and workshop on the water, including the friendly landlord and landlord of the inn where we spent that memorable night, and did her liberal hand forget the good and the poor in the village well

## THE MONTH

### SCIENCE AND ARTS

THERE were many points of general interest in Mr. Freeman's lecture on the Progress of Telegraphy recently delivered before the Institution of Civil Engineers. Not the least of these was his allusion to the outcry for underground wires which is heard whenever a new time plays havoc with our telegraph poles. There is at present no fewer than twelve thousand miles of underground wires in the London area, and an estimate is being caused on how all wires laid underground. In view of this demand for underground lines, it is all important to know that their cost is four times more than that of

overground wires, while their capacity for carrying messages is only one fourth.

There are at present in the Atlantic Ocean nine cables in working order, and it is worthy of notice, as bearing upon the perfection attained in such work, that the most recent cable was laid last year in twelve days without hitch or stoppage. With Mr. Pucca's wondrous assemblage of facts and figures in our minds, it is curious to turn back to the year 1816, when Sir Francis Baily demonstrated the possibility of a telegraph worked by electricity to supersede the cumbersome semaphore system then in use, a system dependent upon sight at long ranges, and which was rendered utterly futile at night and during foggy weather. Sir Francis (then Mr.) Rossini tried to induce the government to take up his advice, and the reply which he received to his application is worth reproducing. It is dated from the Admiralty Office, August 5, in the year named above. 'Mr. Barrow presents his compliments to Mr. Rossini, and acquaints him, with pleasure to his note of the third instant, that telegraphs of any kind are now wholly unnecessary, and that no other than the one now in use will be adopted.'

An interesting demonstration of the utility of the lime light for teaching purposes was lately given before the University of Durham Medical Society. The 'magic lantern' was rightly long regarded as a toy, but of late years, in an improved form, and under the more sensible name of optical lantern, it has given into a most valuable educational instrument. In a modified form it can be made to project the image of opaque objects, so that a diagram from an ordinary book can be shown in an enlarged form to a class of students. All kinds of historical preparations, crystals and minerals, plants and bacteria can be thus shown, whilst by the attachment of proper lenses, the instrument can readily be turned into a projecting microscope. In this form, ordinary microscope slides can be enlarged so that a whole class can view the image, and can be instructed through the aid of grating upon diagrams of the usual microscope kind. We may confidently look forward to the time when every school will possess its optical lantern, and we feel confident that both teachers and pupils will appreciate it as a great help to their joint labours.

During the months of April and May the Lecture Theatre at South Kensington Museum will, under the auspices of the Institute of Agriculture, continue, as during March, to be the scene of a series of lectures addressed to students of agriculture. The subjects include Land drainage, Farm waste and their Application, Natural and Artificial Grasses, Dairy Management, Chemical Changes in the Soil, Farm crops, Insect Pests, Poultry Management, and many other matters pertaining to farming pursuits. A less ambitious programme was carried out in the same theatre last year, when seven thousand students availed themselves of the advantages offered. This success has induced the Institute to enlarge the scope of its labours, and this year, students are not only taught, but those in need of such help are given free tickets and assisted in the matter of railway expenses. A Committee of Ladies will secure lodgings for

female students, and everything seems to have been provided to promote the comfort of all. High class technical education of this kind has for a long time been enjoyed by tenant farmers of many continental countries, and also in the United States. We may feel sure that now England has followed suit, the work will be carried out in a thoroughly practical manner. The movement is one of national importance.

Although the ingenious Chinese are credited with the use of the printing press many centuries before that instrument came to be invented by Caxton, there has always been some difficulty in the dissemination of Chinese literature. The types required are so numerous that the clearest composition is appalled. If this difficulty exists in the Celestial Empire itself, how much more must it be felt in foreign countries where the Chinese have formed populous colonies. In New York a paper has just been started called the *Chinese American*, and the typographical difficulty has been overcome by employing a photographic process. The copy is first of all traced by Chinese clerks in bold Indian ink characters, it is then photographed, and by a well known process, transferred to the lithographic stone, when as many copies can be taken as are required. The first edition of this unique newspaper obtained among the Chinese population of New York a circulation of eight thousand copies.

Herz Paul Heimbach has made some important archaeological discoveries at Mitla, a village in Mexico. Here he has found remains of ancient pyramids and tombs, the walls of which are embellished with stone mosaics, and the roofs supported by columns, a style of architecture which seems to be common to the district. The explorer was not permitted to excavate the sites, but he obtained numerous paintings and photographs. During these operations he and his Indian attendants found the tombs of sleeping apartments, until the latter discovered that they were haunted, and refused to occupy them any longer. The traveller intends to publish a book upon the subject of these discoveries, which will be illustrated by photographs.

The name *Schalensteine* has been given by the people of Switzerland to certain smooth flat stones, hard polished, and covered with dots, lines, curves, and semicircles, which have often been found in different parts of the country, and which have given rise to many conjectures as to their origin and meaning. Many have regarded them as charms or amulets, whilst others have seen in them an ancient mode of commemorating the dead, but in any case the markings upon them have represented uncomprehensible hieroglyphics. Herr Rodiger, who has made a large collection of these curious stones, has recently shown that they are simply charts of the districts in which they are found. The dots represent the towns and villages, and the lines indicate the roads, fords, and mountain passes. In his collection he is able to piece together a stone map of the entire canton in which he resides. These stones would indicate the existence of large populations in prehistoric times, and many of the villages indicated by these stones did not exist far off from the Christians. Herr Rodiger compares the *Schalensteine* to smaller stones found in Germany, Scandinavia, India, and Asia, and considers that they all

another proof of the great antiquity of the Indo-Germanic race. He also considers that they furnish evidence of civilised habits, organised trade, and culture among these races at an infinitely remote period.

An interesting collection of Curo woodwork has recently been exhibited in London, and may possibly represent the first step towards one of those manuals for a particular style of decoration which from time to time attack civilised humanity. Here we have quaint little windows, perforated screens, all in native woodwork, and about five hundred years old. Despite its age, wood and workmanship are in excellent condition, and look as if they would well stand for another five centuries. If its effect be considered too somber for English taste, the bestial work can be gilded and punked to accord with the decorations of modern rooms, but it is never to be treated in its native home. The arrival of this collection of Eastern relics has been followed by a protest from the Secretary of the Society for the Protection of Ancient Buildings. He writes, "that the beautiful motif of Curo is suffering from wholesale removal of woodwork, metal moulds, tiles, and other objects. There have been exported in large quantities to church museums and private collections, and have now acquired such a commercial value, that the owners are naturally tempted to put with them. It is very difficult to see how they can be prevented from doing so."

The time for wood carving, we are glad to see, is still in its infancy. In the present day there is far too much of the staid element. Compounds of various kinds pressed into moulds take the place of the beautiful woodwork valued by our forefathers, and the sham strives to imitate the real. An effort to counteract this state of things is seen in the five studentships which are offered for wood carving by the School of Art, Royal Albert Hall, South Kensington, in connection with the Technical Institute of the City and Guilds of London. Day and evening classes are open to all who wish to earn their livelihood by wood carving, and the scholarship is that candidates must have passed a simple examination in practical drawing. Lines of application and prospectus can be obtained by application to the manager of the school.

Mr. Latham will perhaps look upon it as an honour that his system of carbon lighting has been selected for the illumination of the corridors and passages of the British House of Commons. The House itself is not yet to be lighted by electricity, for gas is found to answer every requirement, but the apparatus to use many of them so noisy and dark, that a better mode of lighting has been found to be indispensable. In this connection we may note the interest which has been recently manifested in the life of those little incandescent lamps, the type of which is represented by the Latham system of lighting. A carbon thread rendered white-hot for many hours every evening, although protected in a vacuum, does not seem to be a very stable arrangement, and many persons have remarked that the expense of replacing the lamps by new ones at short intervals of time must condemn the system. In the Savoy Theatre, London, which is wholly lighted by this type

of lamp—that of Swan—the little carbon threads have now held out for nearly four thousand hours, and we are told that there seems no reason why their lives should not extend to double that period.

The preparations for the International Fisheries Exhibition at South Kensington, in 1901, are, and nearly twenty-three acres of ground are covered by the newly finished building, which have been erected. Every sort of space has now been allotted to different nations, including ten thousand feet in answer to a somewhat late application from Russia. All kinds of apparatus will be exhibited, such as fishing boats, sails, fish traps, fish markets, refrigerating vans for fish conveyance, fishermen's cottages, steam dredgers, and fish horns. In addition to these, there will be salt and fresh water tanks, in which the fish can be seen in a living state. A notable feature of the Exhibition will be a duly demonstration by the National Training School of Cookery of the best three courses kinds of fish, which are not commodious with white washing to the London market, and which are frequently used for manure, can be made into palatable and nutritious food. The Exhibition will be ready by May day, and it is hoped that it will be very well open in person.

It is much disliked even the black beetle—which, however, is not quite black, neither is it a beetle—is more useful than is commonly imagined. We know that it is a good scavenger, turning up unprofitably every kind of refuse. But it is in this connection that we must in future regard the value of the cockroach. In Russia, it is used as a medicine—a diuretic in certain diseases, and it is also unknown in European practice as a remedy, namely in that direction, namely known as *leishman*. The Professor in Jefferson College, Philadelphia, tells us that physicians there prescribe the remedy, and he credits the virtues of cockroaches. Its properties resemble those of cathartics, in that it has the same effect, and having in its digestive tract the same effect as the cathartics. A solution of its faecal cockroaches in which has not a pleasant sound, but after a technical name the mixture would pass muster, and after all, would not be neither in this than many things which form part of our chosen diet—such, for instance, as our ripe cheese.

The disinfecting apparatus of Schimmel & Co., Chemnitz, is now in use in many German hospitals and is found to be thoroughly effective in purifying all kinds of clothing, the operation occupying about one hour and a half. The apparatus consists of a closed case with double walls of metal, between which is a packing of non-conducting material. The clothes to be treated are placed in linen bags and hung upon a kind of wagon, which is wheeled into the case. By the aid of steam from the contents are submitted to a heat of a hundred and ten degrees centigrade for a certain time, after which the steam is allowed to set directly for a short period. The heating is once more applied, and the operation is complete.

We are glad to see that a movement is on foot for the establishment of a permanent meteorological station on Ben Nevis. We have more than once alluded to Mr. W. G. S. noble efforts to obtain records from the instruments provisionally

placed there, and how in all weathers he has faced the difficulties and perils of the ascent. His observations have indicated how useful a purpose a permanent station would fulfil, indeed, it is considered that Ben Nevis would hold the first place among the higher level stations of Europe. The sum required to build and equip a proper observatory on that mountain is six thousand pounds, an amount which will doubtless be long be subscribed.

The New York silk exchange has received a consignment of twenty million Japanese silk worm eggs by direct importation via San Francisco. It is intended to distribute these eggs gratuitously throughout the country, and judging from the number of applications for them, the demand will be in excess of the supply. The eggs are fastened to cards about twelve inches square, and are in first rate condition, many cultivators having already succeeded with them abundantly.

Within the last year or two sericulture (silk) has again got its revival in France, and many people believe that it will once more rise to the position of a great industry there. The reasons for its declension are not far to seek. First of all came the competition of Japan, which was stimulated by the introduction of European methods of culture into this country. Italy also became a serious rival, principally on account of a better and more economical system of rearing. Then the French manufacturers helped the downward movement by the production of goods made from Eastern silks. Finally came the silkworm disease, and the trade was all but destroyed. The nature of this disease has been studied by the able physiologist M. Pasteur, who has pointed out a method whereby the moths can be examined, and the sound eggs separated from those which are infested. As the trade is being revived, but there are difficulties in the way of food, for many mulberry trees have been destroyed by fire and also in the matter of efficient help, for the hands trained to the work have usually sought other employments. But both these are only temporary obstacles to the revival of an industry which only requires time for its development.

We last year called attention to some curious subterranean caverns at Birkbeith, forming holes which at the time gave rise to much speculation. In many parts of Essex and Kent such pits are found, and they generally take the form of a shaft about fifty feet deep, and perhaps a couple of feet in width, terminating below in a hollowed out chamber of considerable size. Such pits occur in the chalk, and are known as deer holes. Mr James Hatch of Leatham, Kent, upon whose land several of these holes occur, has lately pointed out that they were formed long before the introduction of modern manures for agricultural purposes, and were doubtless made in order to reach the pure chalk. This chalk a few centuries ago was the best top dressing for the land which was known, and in conjunction with farmyard manure, was the only fertilizer used.

A Company has been formed to construct a ship canal across the upper end of the peninsula of Florida. Like the greater scheme of Panama, the beds of two rivers, one on each side of the peninsula, will be utilised as part of the proposed

waterway, and no locks will be required. This uninterrupted channel will resemble that of Suez, but the cost of construction will be little more than a fourth of the latter. The amount of shipping which will pass through the new passage is estimated by the New York Board of Trade at a very large figure, and the large annual loss by wreckage on the southern coast of Florida will be avoided. The projectors claim that eight hundred miles of the most dangerous navigation in the world will be obviated by their enterprise, and that remittances upon cargoes will be so reduced as to effect a great saving in that item alone. We do not hear much of the Panama Canal just now, but the work continues to progress. We learn that many labourers from Jamaica are seeking the Isthmus, and are encouraged to remain when they get there. They state the climate will be good, workers with pick and shovel, earn good wages, and are in most respects better off than they are at home.

Recent fatalities at sea have once more brought into prominence the urgent necessity for some improved means of signalling in foggy weather. Look signals on railways are simple enough, but on the trackless ocean something far more efficient must be employed. Powerful horns, whose notes can be arranged into short and long blasts, so as to speak a kind of Morse code have long been devised. By such means a ship is able to indicate the course which she is steering. I have seen

The case of the voice formed the subject of a recent lecture by Charles Alcock Hatch. He said that while natural difficulties of the larynx were of frequent occurrence among sailors, singers were but very seldom attacked by bronchitis. Very few vocalists died of consumption, singing being, as it were, a gymnastic exercise of the lungs, was an excellent prophylactic for those who had a tendency to disease of the lungs. Referring to the importance of breathing through the nostrils, which had never been sufficiently recognised, he said that sometimes, on the morning immediately after rising to breakfast, sailors returned to their nostrils. He was in the habit of using every morning, as a nostril bath, a large tumblerful of tepid water in which was dissolved a tablespoonful of table salt. This water was gently drawn through the nostrils four or five times in succession, and he could earnestly recommend this process to every vocalist. By this means all foreign substances were removed, the passages were cleared, and it was a truly appreciable sensation to be able at once in the morning to inhale freely through the nostrils the fresh air. He further stated that hot steam, strong drink, and heavy tobacco injured the voice, and he took occasion to enter a most decided protest against the fashion of singing immediately after dinner. While we are on the subject, we may remind our readers that the habit of breathing through the nose, with the mouth shut, is useful when encountering draughts or malarious odours. In the one case the cold air is warmed before reaching the windpipe, while in the other the germs of disease may be arrested by the delicate hairs in the nostrils.

From facts just published, it would appear that London is not by any means the only place in the world where an aldermanic love is turtle prevails. New York, we are told, recruits every

year from a hundred and fifty to a hundred and eighty thousand pounds weight of that abominable delicacy. Philadelphia and Baltimore consume together about fifty thousand pounds annually, but the most remarkable statement in the statistics is that the consumption of turtle in the large city of Boston amounts to only two thousand pounds weight per year. Turtles are most plentiful during the summer, and when, as may happen at that season, the supply at New York is larger than the demand, they are kept about, and given cabbage, lettuce, celery tops, and watermelon rinds, the last named article of diet being the most highly prized. A temperature below forty degrees kills turtles, which, as may be mentioned, vary in size from a few pounds to over a quarter of a ton, the largest ever brought to New York having weighed five hundred and sixty pounds. The customers are almost invariably hotel and restaurant keepers.

## OCCASIONAL NOTES.

### IN THE FUTURE DOOMED TO EXTINCTION?

At the recent sale of ivory in London there were a hundred and twenty-nine tons offered, almost all of which consisted of elephant tusks, brought from various parts of Africa. The quality of the ivory offered at these sales was rather inferior, yet it brought seven hundred and fifty pounds per ton. Blackish cutters and cutters-inventurers were the chief purchasers. Dr C. B. Webster, the American consul at Sheffield, in a recent report presented to his government, directed attention to the huge proportion of very small tusks brought to market. This, of course, indicates how many elephants are destroyed in early youth. To show what an injury of this might have attended, Messrs Joseph Rodgers & Sons, of Sheffield, exhibit at their show-rooms an African elephant's tusk nine feet long, twenty-one inches in girth, and weighing a hundred and sixty pounds. This is among the largest tusks on record. Its present value is one hundred and thirty pounds. Dr Webster remarks that an animal large and strong enough to carry such a pair of tusks would attract more attention than Jumbo. It is estimated that the five thousand two hundred and eighty-six tons of ivory imported into Great Britain during the nine years from 1873 to 1881 inclusive represent two hundred and ninety-six thousand and sixteen pairs of tusks, and, consequently, the same number of elephants that have died or been slaughtered to supply the demands of luxury for the past nine years. At this rate of destruction, it is clear that the noble elephant must rapidly disappear, and ivory become a thing of the past, unless the traveller of the future should find fresh sources of supply on a vast scale, or manufacturers be content to use some kind of artificial ivory for many of the purposes to which real ivory is at present unnecessarily applied.

### HOW WORKMEN ARE TRAINED ABROAD.

Mr Swire Smith, one of the Royal Commissioners on Technical Education, has made public some interesting facts relating to the system in use in Belgium for the training of artisans. The

Commissioners visited the gigantic iron and steel works of the Cockrill Company at Suring, near to Laige, founded in 1817 by John Cockrill, a Lancashire man. In the several departments of mining, smelting, forging, and machine making, about ten thousand operatives are employed, with engines working at twelve thousand horse power, while the wages paid amount to four hundred thousand pounds a year. The whole establishment is a marvel of completeness, chimney, and labour-saving appliances. About a hundred draughtsmen are employed, of whom twenty-five are Germans and Swiss from the polytechnic schools of those countries, but there are no English. There are five night schools attended by boys and adults from the works, numbering nearly two thousand, an industrial or technical school attended by about eighty fitters, block-makers, and the clever young men in all the departments, and a morning school with two hundred students. The director of the steel department informed the visitors that he requires all young men under eighteen in his department to attend the night school, a monthly register is furnished to him, and he uses penalties by expulsion from the works those who unjustly absent themselves without notice. Such is his faith in the industrial value of education. A similar state of things exists at the great iron-works near Laige, the Verville Manufacture, where seven thousand five hundred men are employed, and where intelligence in all the operations is so much insisted on that the apprentices are required to attend evening schools. Time-breaking through drink at these vital high-works is almost unknown. These facts cannot fail to be of interest in this country, and clearly point out the direction in which the education of our skilled workmen must tend, if we are to hold our own against continental nations.

### BLACK RAIN.

On the 24th of May last year, a thunderstorm passed over the east of Warwickshire, accompanied by heavy showers of rain, and over an area of three or four miles in diameter, in the parish of Edrom, the rain was observed to be of a dark sooty colour. The streamlets into which the water flowed became dark in colour, and the run left in pools, tubs, and sheep boxes, was also dark coloured. Clothes hanging out during the storm were so blackened that they required to be re-washed, and some of the water left in a basin deposited particles of black sediment on the sides of the vessel. On the same afternoon, a heavy shower of rain fell in the parish of Ashby, distant probably not less than thirty miles in a direct line from Edrom, and there also the water had an 'inky' or 'sooty' aspect.

An interesting gentleman resident in the latter parish had his attention directed to the subject, and lifted, from a pool in a grass field distant from any house, a few specimens of the dark coloured water. This quantity of water, he said, when viewed in body by transmitted natural light, was of a neutral gray tint. The colouring matter, under a magnification of about ten diameters, was seen to be very finely diffused, and showed little tendency to "settle." Under a high magnification, the most conspicuous objects were numerous "pearl-like" looking bodies, elliptical

in shape, and very dark in colour. These were not measured microscopically, but their size would be about one five hundredth of an inch in length, by rather less than half that in breadth. With a power of five hundred diameters, their contents were very distinctly granular. There were also many particles of a watery matter, which had every appearance of being the discharged contents of the larger bodies.

Two samples of the Barrowshire 'black run,' collected by Mr George Young, farmer, Blackadder, West Side, Chirnside, were sent in bottles in analytical chemical jars to Edinburgh, who reported that both waters were dark in colour owing to the presence of organic and carbonaceous particles in mechanical suspension.

The waters otherwise presented different proportions of various ingredients, due apparently to the places from which they were obtained. Both waters, however, were impregnated with organic and infusorial organisms, which largely contributed to the organic matter. The tub from which one of the samples was taken was perfectly clean, so that the water taken from it was unpolluted by contact with any extraneous organic substances. Moreover, many visible witnesses testify to the blackness of the water quite away from dwellings or other polluting influences. All pools in the fields were black, sheep boxes were filled with black water, the rivulets ran black, the river suddenly came down in a black flood, and clothes on hedges were in several instances so blackened that they required to be washed again. Taking the chemical analysis referred to as our basis it may be calculated that a large quantity of solid matter must have fallen in the course of the shower. The rainfall was probably an inch and a half, and as each imperial gallon, according to the chemist, contained 43.56 grains of solid matter, this gives ten tons of solid matter for every hundred acres, or sixty tons to every square mile on which the 'black run' fell.

Some curious questions are suggested by the fall of 'black run,' including that of the agricultural value of the spores, germs, infusorial organisms, and ammonium. Showers of black run are not unprecedented in the same locality, and one at least was observed in Roxburghshire in the summer of 1846, a year of great thunderstorms, and the year in which the potato disease became serious. The phenomenon is curious, and deserves some scientific investigation.

#### THE WEATHER AS IT AFFECTS THE SPA AND RIVER FISHERIES.

According to the *Scottishman*, the Council of the Scottish Meteorological Society has for some years been carrying on observations as to the relation which exists between the state of the weather and the catches of fish during the fishing season. Twenty air thermometers were used daily for nine years in twenty fishing districts on the east coast of Scotland, and the results carefully registered. These results show a close relation between the fluctuations of the catches and changes of temperature, wind, sunshine, cloud, thunder, and other weather phenomena. Thus the observations show, for the six years ending with 1876, that a low tempera-

ture is attended with large catches, and a high temperature with small catches. Good catches are also had when the temperature registers about the average, high temperatures, of short continuance, scarcely diminish the catches. So far as the results of observations have gone, it appears that the maximum catches are made when the temperature of the sea is about 55 degrees, but this point requires further investigation. Thunderstorms, if widespread, are followed for some days by small catches over the region covered by them. The Council has hitherto been unable, from want of funds, to follow up the observations already made, and carry on certain investigations in physics and in natural history which are essential to this inquiry. Of the physical investigations may be mentioned the heating power of the sun's rays at different depths of the sea, which appears to have important bearings, directly and indirectly, on the depth at which herrings are caught.

About the same time the Society began to investigate the relation to meteorology of the salmon and trout fisheries. Mr G. L. Purvis, of Newark, noted for some years the daily catch on the lower Tweed and its mouth, and the temperature of the river above the mill. The results showed direct and important relations between the temperature of the river and the catch of trout and grilse, and, as regards the catch of salmon, it was found that other influences than temperature of the water were required to be taken into account, such as floods, and the temperature of the sea into which the river falls. In 1879, Mr Archibald Young, Scottish Fisheries Commissioner, suggested that the catches, or failure of salmon rivers were probably due to the difference between the temperature of rivers and that of the sea at their mouths. The Council took the idea into consideration, and as the observations required to determine the point were of a novel character, special thermometers, and special boxes for their protection, were designed by Mr T. Stevenson, honorary secretary—these thermometers showing the maximum and minimum temperature each day on the river and the sea.

The desiderata for present requiring to be supplied in carrying on the investigation of sea and river fisheries are—(1) fuller and more exact observations of the temperature of the sea at the surface, and at different depths, by the fishermen at the fishing grounds, (2) the resumption of continuous maximum and minimum temperature observations at Peterhead, and the establishment of similar observations at other points round the coast, (3) the observation of maximum and minimum temperature in the more important salmon rivers, (4) daily temperature of the sea, by boat at some distance from land, at about six selected places, (5) the discussion of past observations, particularly of the herring fishings, (6) assistance of specialists in carrying on investigations into the food of the herring, and into the heating power of the sun's rays at different depths.

Fortunately, the praiseworthy success of the Fisheries Exhibition held in Edinburgh in the spring of last year has enabled the Exhibition Committee to hand over to the Meteorological Society a fair surplus fund, to be devoted by that Society to the elucidation of the above

questions, and in connection with this, the Council of the Society propose to spend the whole of the funds in the furtherance of their inquiries as to sea and river fishing, and for this purpose, numerous stations are to be formed, at which diligent observers will take note of the points to which the Society's efforts are directed. In order to increase the staff of efficient observers, Mr. Buchanan, the Secretary of the Society, and other qualified gentlemen, will from time to time visit the several fishing stations, and impart to the fishermen such instruction as will enable them to make accurate use of the instruments required in the observations. The scheme has much promise in it.

#### NEW PISCICULTURAL ESTABLISHMENT FOR THE TAY DISTRICT

From the *Fish*!!, we learn that the desirability of an extension of the piscicultural establishment at Stormfield, or the formation of a new one in an improved system in another locality, was long under the consideration of the Tay Fishery Board, and at length a new hatchery for salmon has been constructed at Newmill, on the Tay. The hatchery is situated at Duppila, which is in the lower valley of the Tay. The plan is entirely different from that of Stormfield, and has been adopted from the fish hatchery at Hinton, near Strithling, belonging to Sir John Gibon Mainland, the principle being that the ova are deposited in boxes covered in from the weather, and the fry transferred to the river as a later but long, and without being actually fed. The Newmill hatchery is built into the side of a briar or bank, the walls are of tumbrel concrete, and the roof is tiled and plastered, with skylights at each end, and perforated zinc ventilators. The house is fifty feet in length by fifteen feet broad. The breeding boxes are twenty in number, each being seven feet long by nine inches broad, and six inches deep, chained inside, to prevent the growth of fungi. They are arranged in four rows—double row in the centre of the place, and a row along each of the side walls. The boxes are of galvanized iron, and divided into two longitudinal sections, each with an are placed small glass tubes—filled with glass gills—resting at a little distance from the bottom, but so as to be completely submerged, and on these tubes the ova are to be placed. Carefully filtered water will be supplied from a couple of springs, as, according to the new principle, spring water is considered the most favourable for the hatching, but when this stage is completed, lock water from the lock at Duppila Castle will be substituted, as being the best for the fry. The water will flow in a steady even stream over the boxes to a depth of three or four inches, and when the ova are hatched, the glass tubes will be removed, and the fry may swim about.

One advantage of the system is, that all the ova will be distinctly seen, and those found to be decaying can be easily removed. Each box will be stocked with fifteen thousand ova, so that the whole will contain three hundred thousand ova. It is held that this system will in its results prove much superior to that in operation at Stormfield, where only from ten to twenty per cent

of the ova, it is believed, come to maturity, while Sir James Gibson Mainland estimates that on the new plan about ninety or ninety-five per cent of the ova will be hatched. Finally, the fry will be carried to the Tay and other rivers with perfect safety, in large bottles, capable of containing from eight to ten thousand young fish.

#### HOW TO GET RID OF RATS

The plague which rats are in many places rendered justifiable almost any means of getting rid of them. A correspondent who has had practical experience, writes a contemporary stating that caustic soda is the best and speediest means of getting rid of them. 'Caustic soda' costs twenty pence in strength, costs, he says, nine pence per ton, but can be purchased in ten kegs from any dry-goods store about ten shillings per hundred weight. It is in a solid state, and can be easily broken up in small pieces large enough to push into a rat hole. It is good to use it thus. Mix some in an iron or steel barrel, and pour it into the holes so that the ground around may be saturated with it, then run one or two pieces into the holes, so that the rats may not undisturb and scratch them away. When the rats come to the mouth of the hole and smell the soda, they will begin to scratch until they move it, but the fluid soda has wet the soil around them, and their feet will get blistered, and they cannot remove the soil pieces. As the pieces to the air keeps the surface of the soda always wet, but long before the pieces are entirely melted away, the rats will have found their hole. As to dogs or poultry suffering by its use, care should be taken to keep them from touching it. Where the ground is undisturbed by a series of holes, I would insert pieces of wood covered with soil into the holes, and slowly pour a quantity of the melted soda on the ground around, giving time for it to dry in. Rats are exceedingly cunning, and if they find themselves constantly killed to get themselves severely burned when running about their favorite haunts, they will entirely forsake the premises. As to handling caustic soda, it should not be touched with the unprotected hand, and care should be used when handling it not to let it splash on the face or eyes, and I think, with these instructions and a little perseverance, the man must be enabled who cannot fire his house or buildings from rats.

#### FAMILY PICTURE WRITING.

When James Nasmyth, the inventor of the steam hammer, was travelling abroad, and at a loss for the language, he almost invariably had recourse to his pencil, and on one occasion illustrated the dinner he wanted, and being obliged to start early next morning, he sketched a picture standing at the door at sunrise, much to the amusement of his host and hostess. This is an example of modern picture writing, but that of the ancients is a great deal harder to interpret. We have heard a great deal about the hieroglyphic place of Egypt and Arabia, but not so much about the rude picture writing of the western Indian tribes. On the coast of Guiana are various curious carvings, which have been a puzzle to all who

have looked upon them. The Indians of Guiana—a harmless and peaceable race, fast becoming extinct before the advances of the white man—know nothing of their origin, and credit these rock pictures to their great spirit Makumaim.

A pamphlet (price two shillings) has been written by Mr A Winter entitled *Indian Pictured Rocks of Guiana* (published by Fidd & Co., of Doctors Commons, London), with illustrations, from which it appears that these scratchings are of two kinds, deep and shallow. We give the author's interpretation of a few of the hieroglyphics, which, while leaving room for difference of opinion, have the merit of being suggestive and ingenious. He traces a resemblance in some of these mystic figures to the idolatry of the East. One example on the Rio Negro shows two ships on a detached rock and a group of thirteen men in a row, dancing. One of the ships is apparently being built, the other is being launched. Mr Winter draws the conjecture that these drawings figure myriads of the army in that region, in 1540, of Gonzalo Pizarro, brother of the conqueror of Peru, who also built a brigantine when in the country. The impression made upon the natives mind by the building of a boat in their midst is thus recorded upon the rock.

A very common representation on these rocks is that of a knotted cord, evidently in Indian way of marking the time, like the present method of a string of beads. At Waraputi Lake, on the Lamquibo, there is the representation of a group of small crosses in a confused row like a cluster of stars. The symbol occurs on the figure of Thalo, the Mexican rain god, and Mr Winter concludes that this may be the record of some catastrophe attendant on a great storm. Other curious astronomical figures might be the record of the appearance of a comet, some of which are carved on the Balise and Cumatene rivers are supposed to be the work of sun worshippers. This may be so, if the figures are to be understood as representing the sun, the luminous being used by the 'poets' to the earth to keep it within its orbit. This little book has been issued with the view of raising funds for the Indian Mission in the Upper Putaro district, British Guiana.

#### THE SINKING OF OIL

During the tempest which raged on Tuesday the 6th of March, the *Navarra*, a passenger steamer, went down in the North Sea, and, with the exception of sixteen persons who were saved, all her passengers and crew, together numbering about eighty, went down with her. Two sunken which happened to be near at hand rendered some assistance to the unfortunate who happened to be on board the sinking vessel, several of whom were after a severe struggle rescued and taken ashore. From all the accounts we have read of this direful catastrophe, we see no mention of Oil having been even thought of as a means of comforting on board, swept all before them, flooded the hold and engine room, and sent the ill-fated craft to the bottom.

In the present Part of this *Journal* we have given another instance (one of many already cited

in our pages) of a ship, the *Glamorganshire*, having been saved by the timely use of oil, and with such examples on record, we are amazed to note the apathy with which this simple life-saving appliance is still regarded. Ship captains and sailors of every class must now be quite cognizant of the fact that oil, cast overboard, will prevent even the highest waves from breaking, and that almost any craft will ride out a blowy but unbroken sea.

Ships that leave port unfurnished with oil in case of emergency, are detracted of one of their chief elements of safety, and those who own and command them ought to be held criminally responsible.

#### AN EASTER THOUGHT

Erased the thrush from branches ladling  
In the first fire of April green  
Gleamed the yellow cowslip smiling  
All the meads with redly sheen,  
And the bee in rhythm settled  
To the first stirrings of the sun  
And the wild flower opened its petals  
To the sunny southern wind.

Oh while all things are waking  
In the long weill upon!  
Say next hours alone be breaking  
For the time they have not found  
And I must lightly seek relief  
Like dead flowers I cry out to—  
Shall I have no remembrance  
In a heavenly kinder tide?

Surely He whose power over us dwells  
Lift within the leaf and tree  
And to soothe us all for then,  
But, as we the instant—  
He can make the life and duty  
Humble souls each one of us  
And bring forth the little light  
Of the inner, stamped within.

Oh when breaks the dark December  
Over lighted tree and flower,  
Hopefully we will remember  
Heaven's waked by sun and snow  
And when winter's calm is known,  
And thick of snow you'll see  
We will look for God's promise,  
Bringing water to the soul.

The General of CHAMBERS'S JOURNAL is directed to the attention of CONTRIBUTORS to the following notes.

- 1st All communications should be addressed to the Editor, 39 High Street, Edinburgh.
  - 2nd To insure return in case of inability postage stamps should accompany every manuscript.
  - 3rd Manuscripts should bear the author's full Christian name, surname, and Address legibly written and should be written on white (not blue) paper, and on one side of the leaf only.
  - 4th Offerings of Verse should preferably be accompanied by a stamped and directed envelope.
- Unless Contributors comply with the above rules, the Editor cannot undertake to return unsuitable papers.

Printed and Published by W & R CHAMBERS, 47 Johnston Row, London, and 39 High Street, Edinburgh.

## SHETLAND AND ITS INDUSTRIES

BY EDWARD RANKIN

IN TWO PARTS.—I. ISLAND INDUSTRIES.

WITHIN the last few years, and particularly within the last decade, 'the naked melancholy tales of farthest Thule' have been attracting a considerable amount of public attention, from the extraordinary progress which they have made, and are still making, in the development of their resources, and in the intellectual and social advancement of their inhabitants. Not the least remarkable feature in this progress is the manifestation of an energetic and intelligent public spirit, which is probably the best guarantee for their increasing prosperity, and which is already showing good results in every department of social life. It is not so long ago that the grievances of the oppressed inhabitants of Zeeland were a fruitful topic of discussion amongst all interested in these remote islands. So late as the year 1875, a pamphlet was published under the title of 'Semi-slavery in the Shetland Islands,' in which the unhappy condition of the Shetland peasant was set forth with considerable force and no less considerable warmth in a letter to a Member of Parliament. If there was a certain amount of exaggeration in depicting the Shetland fisherman and crofter as an hereditary bondman, cowed, apathetic, insufficiently fed, miserably housed, destitute of medical aid, and totally uneducated either in spiritual or in secular instruction—the Report of the Truck Commission in 1878 lent at least some weight to the assertions, and disclosed certain abuses of which he undoubtedly had good right to complain.

But it is satisfactory to think that there are in a great measure things of the past, and that the Shetland peasant of to-day, as well as those above him in the social scale—fishermen and landlords alike—is as devoted a believer in the new social gospel of co-operation, energy, industry, and thrift, as his most ardent well-wishers may for the present desire. True, it

must be admitted, of the old leaven still exist, the old spirit of monopoly and class interest is not yet wholly extinct. But it is powerless to withstand the increasing force of public opinion, and even the capital, and with it the influence of the islands, will be in the hands of those to whom it was for centuries denied, and who, if present indications are not deceitful, may be trusted to employ it in promoting the best interests of their sea-girt home. At the present day, there is probably no more contented a peasantry within the whole of Her Majesty's dominions than that of Shetland. The relations between landlord and tenant, between fisherman and crofter, are of the most amicable description, and if the remarkable success in certain branches of the industries of the islands has for the moment operated in effecting a modification of the condition under which business is transacted between these last two, this is a matter which cannot fail to right itself without the slightest friction and at no distant date. The worst office that could possibly be done to the Shetland fisherman and crofter would be to inculcate a suspicion that the oppressions of the last generation are being perpetuated in this.

To those to whom the race of a hitherto obscure community is a subject of interest, as well as to those who are anxious to see the last vestiges of a condition of social manners, customs, and habits of thought which is fast disappearing from our midst, we can confidently recommend a visit to Shetland. Only fifty years ago, such an excursion would have to be made by sailing vessel, and the time occupied on the voyage would probably have been a week at the least. But the powerful and comfortable steamers of the North of Scotland, Orkney and Shetland Steam Navigation Company, now make the run of two hundred and fifty miles from Lath in thirty-six hours, and with mails thrice a week in summer and twice in winter, a trip to Thule has been brought within the fast enlarging circle of ordinary holiday tours.

Nor need the discomfort of the voyage deter

the stranger. Such crucial passages as the entrance to the Moray Firth, the crossing of the Firth of Forth and the Roost of Sunburgh may, in the ordinary case, be traversed in summer without the slightest discomfort. It is otherwise, no doubt, during the boisterous gales of spring and autumn. But at such seasons—if for no other reason than that the land is not then seen at its best—the traveller had better stay at home. The cold grey mists, the tearing winds, the thick fogs which occasionally visit the islands, are apt to exercise a depressing effect upon his imagination, and lead him to think of Shetland as a desert of peat bog and weathered rock—of ‘moors and moorland and wilderness, gulleries are diverse great waters. No impression could be more unjust. If the hundred islands, holms, and skerries which go to make up the Shetland archipelago are destitute of the soft grasses which mountain and river, tree and stream, confer upon more southerly regions, they are not without a beauty of their own. Apart from their unequalled rock scenery—their iron bound cliffs, their isolated stacks, their penetrating caves, their deeply indented creeks and voes and gyres—they can show many a green valley, many a solitary loch, many a gravelly beach covered with fishermen's cottages, and with lumps of cod and tusk and ling drying in the sun, which would form no unworthy subject for the artist's pencil. Abbe in landscape and seascapes their charms attract a yearly increasing crowd of summer tourists, and the two excellent hotels and the numerous lodging houses of Lerwick are taxed to their utmost to supply the accommodation which an large influx of strangers demands.

It is in Lerwick, the capital of the islands, and a town of about four thousand inhabitants, that this blending of the old and the new to which we have already referred as being so characteristic of modern Shetland, is principally observable. Of comparatively modern erection—its first house was built only two hundred years ago—it has already an old and a new town. The old is still the business part of the town. It consists of a single paved street, following the outline of the bay, and so narrow in some places that a four wheeled vehicle can with difficulty thread its way through. It is distinguished by its old fashioned small windowed houses, whose gray gables elude into the sea, to facilitate, it is said, the landing in older times of many a pipe of Ribemah wine and many a ‘graybeard’ of Holland which never paid toll to His Majesty's Exchequer. From this single street, steep lanes or *truncs*, crowded with mean dwellings, lead up to the ridge called the Hillhead, on which the new town is situated. On this ridge—of which Fort Charlotte and the Anderson Institute, an important educational establishment, form respectively the northern and southern extremities—are to be found the seven churches of which Lerwick can boast, the

county buildings, the handsome town hall and municipal buildings now in course of erection, the public and infant schools, and the villas and cottages of the richer class of citizens. The whole of this new town has sprung up within the last fifteen or sixteen years. The first feu was allotted in the year 1860, and if building proceeds at the same rate as at present, before another fifteen years have expired, the over crowding which is the main drawback to the prosperity of Lerwick may be expected to be a thing of the past.

At present, the municipal authorities experience great difficulty in enforcing the statutory provisions as to lodging house accommodation. Since the establishment of the Royal Naval Reserve force in 1883, Lerwick has steadily advanced, until it is now one of the principal stations in the kingdom. During the six months from 1st October to 31st March, the town receives annually an influx of about eleven hundred men. The course of instruction lasts for twenty-eight days, and the average number of men on drill duty is one hundred and ninety-eight. To provide lodgings for so many fishermen and seamen severely taxes the resources of the town, as the number of its inhabited houses is as yet only about hundred and sixty-seven. But as each first class Reserve man receives one guinea per week when on drill and six pounds returning sea, and each second class man nineteen shillings and threepence drill pay and two pounds twelve shillings retaining fee, whereby a large sum of money is brought annually into Shetland, the local authorities are obliged to shut their eyes to a state of things of which they warmly disapprove, rather than lose the benefit which so great an increase of wealth must necessarily produce to a poor country like Shetland.

In respect of lighting, water, and sewerage, Lerwick, though its sanitary condition is not yet ideally perfect, has made great strides within the last few years. Gas was introduced in the spring of 1876 by a Company, which—taking the average of the last ten years, and with gas at the almost prohibitory rate of from eleven shillings and sixpence to nine shillings and twopenny per thousand cubic feet—already pays a dividend of six per cent. The elaborate system of water supply and sewerage, carried out by the Messrs Leake, C.L. of Edinburgh, at a cost of four thousand four hundred and fifty pounds for water, and two thousand three hundred and sixty-five pounds for sewerage, was established in 1871. The new Cemetery, on the steep promontory rising in the conical stack called the Knab to the south of the town, and beyond its actual limits, was opened in 1874. Altogether, it only needs a public hospital, a combination poorhouse, and a semimodest covered in market—all of which will doubtless come in due time—to make Lerwick one of the best equipped towns in the whole of the north of Scotland.

Of the public works presently in progress, the most important are the town hall—of which the foundation stone was laid by the Duke of Edinburgh, on the 24th January 1882—and the harbour works. The former is being erected by a limited Company, from the designs of Mr Alexander Ross, the eminent architect of Inverness Cathedral, and looking to the very numerous gifts

of stained glass windows, stone carvings, ornamental mantel pieces, and other decorations with which it is being enriched, it bids fair to be one of the most interesting buildings of its kind in the kingdom. Besides a spacious and handsome Hall for public meetings and entertainments, a Burgh Court Room, police cells, and Town Clerk's office, it will provide accommodation for the Customs and Inland Revenue, for one of the two Masonic lodges in Lerwick, for the Good Templars, and for the Shetland Club. The harbour works consist of a stone and iron pier, and a spacious esplanade extending almost the whole length of the town, and which is expected will relieve to a great extent the plethora of traffic which at times renders Commercial Street inconveniently crowded. The cost of these works is estimated at fifty or thousand pounds.

In all these minor matters which conduce to the amenities of life, the inhabitants of Lerwick show a praiseworthy energy. A Bowling room with fully tiled, runs in recently been established by the Shetland Literary and Scientific Society, whose Library and Book Club form the sole means of recreation which the Shetlanders at present possess. For the last three years, the regatta of the Lerwick Bowling Club has been the means of providing the Lerwickians with an annual holiday, which is much appreciated. Within the last few months, a Horticultural Society has been instituted to encourage the cultivation and distribution of flowers, principally amongst the poorer classes. Besides this, Lerwick possesses football, cricket, and swimming clubs, a choral society which gives two or three concerts annually, and lawn tennis finds in the far North some of its most diligent votaries.

It speaks volumes for the law abiding character of the Shetlanders that the whole police force in the islands consists of only two men—a country and a burgh superintendent. Serious crime is all but unknown. Drunkenness, even during the festivities of Yuletide, is almost entirely absent from the streets. During the first fortnight of January of this year, six hundred persons donned the Blue Ribbon, and of these upwards of four hundred took the pledge.

Nothing strikes the stranger so forcibly on his first visit to Lerwick as the essentially Norse character of the town and its inhabitants. The names on the shop doors, the names of the lower classes, the street scenes, the physical appearance of the people, all remind one of Scandinavia. The scandalised post woman, carrying home their winter fuel in straw baskets, called 'key-bags,' on their backs, from the Stony Hill, Luntun, suddenly as they tramp along, the limbed fishermen with their circular pitlock nets over their shoulders, the pinnated ponies, laden with gase and fowl and other country produce, the long fish spears hanging up outside every cottage door, the privacy of carts and carriages—give Lerwick a foreign complexion which is both picturesque and unique. And when, in early summer, the 'booms' and luggers of the Dutch fishing fleet crowd its landlocked harbour, and petticoated, red shuted, 'climber'-shod Hollanders, smoking halfpenny pipes, throng its streets, the visitor may well rub his eyes, and wonder if he has not mistaken his destination, and landed in some sea-faring place of the Netherlands or Sweden,

instead of the Scottish port for which his ticket had been taken.

If persistence he penetrates into the country districts of the islands, this feeling will be intensified. The Shetland 'town', with its straw thatched cottages, its peat stacks, its flocks of errant geese, and its patches of *ewary*\* cultivation, is unlike any Scotch or English hamlet. Beyond its turf dikes is the 'acasheld' or common, in which each cottager has a right of property in proportion to the extent of mark lands† he holds within the 'town'. Here the peasant depastures his stock—his flocks of black, white, brown, and mottled coloured (a brownish red) sheep, his herds of shaggy wild eyed ponies, and during the day at least, his short-legged, small horned, handsome little kine. Here he cuts his peats for the winter, using for that purpose, a spade like instrument called a 'tushar,' which lifts each peat entire. Here he collects his store of manure for the farmwork of his little croft, 'scalping' the turf for that purpose, to the no small detriment, it must be confessed, of the beauty of the landscape. And here, in some sheltered spot, where the soil is rich and dry, he establishes his 'plantarave' or 'kail yard,' surrounding it with a dry-stone dike, to prevent the intrusion of sheep.

Notwithstanding the considerable advances that have been made within the last thirty or forty years, agriculture in Shetland—probably for the very good reason that Shetland is a growing rather than an eradicative country—is still in a backward condition. The old wooden hand plough, still to be seen in some parts of Norway, and once universal, has almost entirely disappeared. But the harrow with wooden teeth, and the small sharp spear shaped spade with a wooden foot-plate, which is always worked down hill, are yet in common use. Manure is carried in straw baskets, chiefly on the backs of women. The sickle is used in reaping, the scythe being seldom employed except for mowing the meadows. In the 'ben' end of almost every cottage—for the poorest has its 'ben' and its 'ban'—is a rude kiln for drying corn. This kiln, of an oblong form, is called a 'cunn,' is furnished with ribs of wood, and covered with oat straw called 'gloy,' and the grain is laid on the top. In an opening about one foot square in the end of the kiln, a gentle post fire is kept up till the corn is sufficiently dried. The grain is then taken off, put into a straw basket called a 'skeb,' and rubbed while warm under the feet, to detach the beard and dust. It is next winnowed between two doors where there is a current of wind, or in the open air, put into another straw basket called a 'baddy,' and carried to the mill to be ground. But the old Shetland mill, spanning a mountain stream, with its wooden horizontal water wheel and its primitive machinery, is now scarcely ever seen in the

\* *Ewary*, a term applied to a kind of cultivation once common throughout Scotland in which the alternate patches or ridges of a field belonged to different proprietors or tenants.

† *Mark lands* is another term, once common to all Scotland, and now generally obsolete. The extent of land was so designated from the number of marks—a mark representing one shilling and a penny sterling—whilst the holder annually paid by way of tax to the sovereign or superior from whom the lands were held.

Bere—a coarse kind of barley—and oats are the principal grains cultivated. The 'year,' or seed time does not commence till the end of March.

Most of the work on the crops of the peuntry is done by the weaker sex, for here, as in other essentially fishing communities, 'the woman is the better man.' But judging from present appearances, the days of the Shetland crofter are numbered, as every year greater attention is being paid to fishing. Such a result would undoubtedly be a benefit to Shetland. Large farms, properly drained, with threshing machines, reaping machines, and a regular rotation of crops, such as those which already exist and prosper in some parts of the islands, would supplant the slovenly and wasteful peat culture which at present too exclusively prevails, and the Shetland peasant, freed from a labour for which he is unfitted, would reap his harvest from the sea, which is his peculiarity, and after all his rights fishfold, and the various aspects of which we shall consider in our next paper.

## ONE FALSE, BOTH FAIR, OR, A HARD KNOT

BY JONAS BARWOOD.

CHAPTER XIV.—HALF AN HOUR TOO SOON.

AN invitation to dinner in my men in such a little. There are some such but lunge which are of the nature of those gold medals of honour conferred at Exhibitions, whereof advertising firms make capital an exorbitantly, whereas others are the small coin or unconsidered counters of every day social existence. To be chronicled in the *Morning Post* as a dinner at Minkith House is a valuable certificate for a young man who has his way to make in society or the professions. To be registered among the feasters at Mondervik House confers a certain celebrity, less solid, but more brilliant. To be the guest of such an entertainment as Sir Pagan Carew would, to the wary and veteran diner out of London, have suggested nothing but the certainty of bad cookery and dubious vintages, and the still worse probability of making those queer acquaintances whom it is so proverbially difficult to cold shoulder or to shake off. Yet Arthur Talbot went cheerfully enough to keep his appointment in Bruton Street. He knew the butler, and liked him well, although there was a wide gulf, as culture and tone of thought, between the two men. And then Sir Pagan was Clare's brother, albeit Clare herself was probably quite as much of an enigma to her kith and kin as she was becoming to him self. Could it be that prosperity and pomp, and splendour and power, were combining to spoil that fine nature, and that the delicate sweet young girl, who had grown up like a wild blossom amidst the dark Devon moors, was now becoming cold and egotistical in the proud solitude of her high position? He feared so; and yet—

Bruton Street at last, not that the way had seemed long to Arthur, wrapped in meditation as he was, and he laid his hand upon the rusty knocker and awoke the echoes within. A man, in shirt-sleeves and very hot, with a white cravat and black garments, but with 'green-groom' plainly written on his ingenuous countenance,

came bustling to the door, and admitted the guest, with an air of manifest disappointment that he was not some amiable young fop or pinstriped. Another man, Sir Pagan's nondescript servant in livery, more groom than footman, then appeared, hastily shaking himself into his bright buttoned coat. The narrow hall was dimly lighted, and littered with trays and wine-baskets, and from the dining room itself there came a portentous hum and clatter of preparation. Arthur was hurriedly ushered up the darkling staircase, and into the faded drawing room, where the gas was blazing brightly enough. The room had only one occupant, a slender girl, dressed in black, who was arranging some fresh cut flowers in a great porcelain vase that stood in the centre of an old-fashioned low table. She started, and turned round like a frightened fawn at the sound of the opening door and the muttered announcement of the visitor's name. There was no mistaking the beautiful young face, crowned by golden hair.

'Mr Talbot!' said the girl timidly, and then held out her hand in sign of greeting. She had let the tiny basket which she held drop upon the floor, and one or two of the blossoms and a trail of moss were strewed over the carpet.

Arthur stepped to pick them up. 'I startled you, I fear,' he said, smiling. 'I am here by your brother's invitation, and from the terms of it, I did not expect'—

'To see me,' answered she to whom he spoke, as he hesitated. 'I suppose not, and I, too, was quite taken by surprise, though you are an old friend, Mr Talbot. This is one of Papa's bachelor parties, and I was trying to be useful, and was shut out like Cinderella at the ball. I had oversteered my time, and that it was more than half-past eight, and my brother's guests arriving.'

'Mine was a verbal invitation—I thought it was for eight o'clock,' said Talbot, half amused and half annoyed at his own inadvertence, as he glanced at the gilt clock on the chimney piece, of chipped but massive make. 'I began to see what a blunder I have made, and that I have come half an hour too soon. I only hope that you will forgive my rustic awkwardness, and not let me banish you from the drawing room. It would be bitter if I, as the trespasser, were to take flight. Perhaps you will let me help you with the flowers, or, if you will, hold the basket. I think I might be capable of that.'

His host's order accepted his assistance readily enough, as, with patient care, she put the final touches to the arrangement of the flowers in the vase, but her face was averted, and her slender white fingers trembled very much, so that the process was a slow one. Arthur himself felt embarrassed at a meeting so wholly unexpected. How well, in Egypt, had he known the two sisters! Then, they had appeared all but inseparable, now something he could not conjecture what, had occurred to occasion an estrangement between them. Talbot was far from grasping the key of the enigma. Lady Barbara's circular utterances had implied that the blame for this sudden separation lay at the door of the sister now before him, but then, of what imaginable fault could she have been guilty? and was it possible that some feminine quarrel, some silly

ebullition of temper, had been misconstrued and magnified, perhaps by the injudicious partisanship of the dignified aunt of the late Marquis, and had thus brought about a severance between those who had seemed indissolubly united?

'I was at Leominster House yesterday,' said Arthur, who felt it incumbent on him to change the subject. 'I should not have called—not yet, at least, but Lady Burbur, who was most gracious, insisted on my doing so, and the Marchioness'—

As if a wisp had smitten her, the girl started from him, and all the colour faded from her face, while her eyes dilated, and she gazed at him with a sort of horror that was to him perplexing and painful withal. 'You have been there—been to her?' she asked, as if mere dulness

'There must be some mistake,' said Talbot gently. 'I merely mentioned my visit, at Lady Burbur's Monticomeys' expense, with its Lady Marchioness, and that the Marchioness, your sister'—

'The Marchioness—my sister?' interrupted the girl, with a long quivering cry of rage—'Is it possible—in this, that you have not heard'—

'Heard what? what?' Talbot, with pitying softness in his tone, for he could mark her intense agitation, while he could not, but his very last depended on it, divine its cause.

'I thought,' answered the girl patiently, 'that you—that my brother would have told you—you and he are friends—so were we two, not long ago, in that country that now seems so far away. But he has, it seems, left it to me to tell you, if I can, the dreadful truth—Mr. Talbot' she added, looking him full in the face, though her blue eyes swam with tears, and her voice was tremulous and broken, 'who am I?' For what did you take me?

Never had Arthur been asked so perplexing a question. 'Really—Miss Galloway, in the room, when his hesitating speech was interrupted by a passionate outbreak of sobbing, and, covering her face with her hands, his attendants' sister rushed from the room, the quickest, perhaps, because at that moment there was the most remarkable sound of feet and voices on the staircase, and soon the door of the drawing room was swung open, and 'Sir Thomas Jenkins,' 'Captain Spurrer,' 'Mr. Beamish,' were announced in rapid succession by the footman.

Three gentlemen came in. The first was old Sir Thomas, Jenkins—a very aged baronet, not too well off. Well-meaning, dull Sir Thomas had a wife and a daughter at home, and was by far too domestic a character to be a frequent dinner guest on garrison. But he had a high traditional regard for the decayed House of Carver, and would have felt a pang had he refused the invitation of his brother baronet.

Of a very different mould was gallant Captain Spurrer, once, in India and on the Afghan frontier, reputed a dashing officer of light cavalry, and who had only needed the opportunity of a protracted European war to win renown with his sword. As it was, he was out of the army long ago, and lived and won laurels such as they were, by making his neck fearlessly on any horse a patron chose to offer, on any steep.

chase course in all Europe. His new career was far more dangerous than his old one, since life and limb were perpetually in peril, and fraught with the temptations that beset the gentleman rider even more than the humbly born jockey. But, 'as honest as Spurrer' was a proverb on the racetrack, and a good deal of his desperately won earnings found its way to a quiet villa on the seacoast near Wharfedale, where an old mother and two spinster sisters had much cause to pray for his life.

Of another mould, too, though a meener one, was, like Mr. Beamish, the rattling Irish barrister, whom two great ambitions were to win an English wife noble and well endowed, and a British borough, by the strength of his fluent tongue and facile generalization, and who really seemed, in an epoch like our own, when blatant charlatans find only too many ears open to their audacious assertions, likely to succeed in both of these modest aspirations. Envious Irishmen, lower down the ladder of social life, avowed that 'Patsy Beamish's' father had been a waiter in a Cork hotel, and that 'Patsy' himself had been a grand-brother's deputy, and winner of other gossamer's halfpence at pitch and toss in the quays, long before his paper savings sent him up to become a student of Trinity College, and a bewinged ornament of the Irish bar. A clever fellow, unquestionably, and a rising man, as some newspapers protested, was Mr. Beamish from Ireland.

Then came bursting in Sir Pagan, the host, hot and flustered, after his scurrier home in a hansom, and his barred toilet apologizing to his guests, individually, as he wound their hands in turn, for his own non-appearance to receive them. 'So sorry, Sir Thomas—business engagement—hope I didn't keep you long.' 'Beg pardon, Mr. Beamish, couldn't get away.' 'Talbot, you'll excuse my being so rude to—' 'Sorry, Spurrer, but I was kept ten miles from London, almost a horse that Colerainmouth—that fellow in the Lancashire—wants to sell. He's a grand horse to look at.' These last sentences were uttered in a low and secret confidential tone.

'Ah, a horse, did you buy him?' asked the Captain, puckering up his clear dark eyes, as was his wont when he scanned an ugly piece in the fence towards which he was, professionally, riding hard in silken jacket. Never had he himself pocketed a wonderful specimen, but he knew how slippery are the paths on which those who deal in horses, whether to buy, sell, or bet, must travel, and how hard it is to be concerned about those noble, all-inducing animals without degenerating into knave or dupe.

'No, I didn't,' retorted the baronet expressively, as if he had been saved from a great danger, and then he turned to welcome 'Mr. Fulford,' 'Colonel Pruden,' and one or two more honest Devon gentlemen, who had stretched a point to avail themselves of the invitation of a Cure of Curwen. Then in came the two or three other guests, mere London dinner-out clubmen of no especial note, and then dinner was announced, and there was a stumbling progress down stairs, made especially awkward by old Sir Thomas Jenkins, who, with his unquenched politeness, turned to apologise to his sisters for preceding them down the narrow staircase, and caused more than

one clumsy stoppage before the banqueting hall was reached.

It was a bad dinner. It could scarcely be otherwise, given as it was in Barton Street, by a bachelor baronet on the verge of bankruptcy, and whose straitened circumstances did not permit him to secure the services of that rare one of domesticity, a good cook. Some of the battered old Carver plate had as yet escaped the melting pot of the silversmith, and with the aid of fresh flowers and bohemian fruit, it made a brave show as it could, but the waiting was bad, the made dishes were an indigestible compendium of the perversity of a party-cook could well contrive, and what some of the wine was good, much of it was execrable. Nor was the conversation such as might atone for the shortcomings of viands and vintage. Mr Beauchamp, with his only Cork brogue and easy flow of words, took the lion's share in it, while the only other talker was Colonel Prédoux, who commanded a militia battalion somewhere in the western counties, and was more ostentatiously 'popeyed' in his discourse than the smartest martinet in the regular army. Captain Spurner, finding himself in un congenial company, and very little Sir Thomas, after a vain attempt to interest his neighbours at table in his usual topics, poetry, sea-stories, peacocks, and tarapake trusts, became as mute as a fish, and Sir Pagan, as a silent host, found himself unable to dispel the general dullness. He had never learned the truth, that dinner giving is a branch of the fine art, and that to assert the company is to the full as necessary to enjoyment as it is to provide for the commensals. He was himself a shy, moody man, painfully conscious of his narrow education and scanty reading, and all case when not among those of his own set. The giving of this particular dinner he looked upon as an act of duty, if not of actual pleasure, and was on thorns until the whole affair should be over, and he himself free to resume the interrupted thread of his habitual life.

One member of the party, Sir Pagan felt, had disappointed the hopes which his host had secretly entertained concerning his demeanour at the festive board. He had always had a high opinion of Arthur Talbot, not merely as an honourable gentleman, but as, what the sporting baronet admired so humbly as French valour, when Louis XIV was king, admired French wit—a clever fellow. He had looked on him as a counterpoise to Blamish the Corkigan bannister, whose too voluble disclosures was unelicted save by the deductive processes of the militia colonel, whereas Talbot, fresh from Egypt too, and with a memory presumably stored with travellers' tales, did not so much as allude to the dromedary by a single allusion to dragomans and dahabiehs, and contributed nothing more. The debate thus did heavy Squire Fulford, whose thoughts were of calceke and drain tiles and shortbouts. The truth was, that Arthur's thoughts were far away from the immediate purpose of the social gathering. He was unconscious of the exceeding dullness of the ill-cooked dinner, and as for the wine, it mattered little to him whether the sherry came from Hamburg or Cadiz, the champagne from Epervay or Cotte. Even the down or so of sound claret

that Sir Pagan had brought up reluctantly from his father's disreputable cellar, did not, so far as his modest share of it went, make itself any more noticed by its velvet smoothness than did the kind herb of the Libe counterfeited of golden Amontillado. He cared nothing for the blizzard talk and circuit jokes of the rising Irish barister, and was not even aware how very stupid and wearisome the party was.

The truth was that Arthur Talbot now felt that a riddle which it might have puzzled Cleopatra to solve, had suddenly been set before him. What was the real cause of the quarrel or the estrangement between those twin sisters, Clara and Clara, the one so highly placed in the world as to marry, the other as richly endowed, in spite of her poverty, with the gift of nature's giving? He had seen enough of both—or thought he had—to feel convinced that their sisterly love for one another was no mere thing of habit, and that it must have taken some deep lying motive, some violent wrench, to bring about the scandal of the separation. He had seen but yesterday the one sister in the solemn staidness of her late husband's home. That evening he had spoken with the other beneath her in their roof. Each had received him with embowered coldness. Each had seemed to be smothering under some sense of undesired wrong. What was it that had fallen both? The attentions which he had heard had been so cynical that they offended rather than enlightened his intelligence. It is not surprising that he was reckoned as among the damages of the party.

The dinner was over at last, and coffee and cigars and cigar and other liquor, from which Sir Thomas drank heedful of the warnings of his doctor, revealed to him a riddle-maze, being slowly disposed of, and this not being one of those repasts that are followed by card playing or such like the thunder of ill success to the loud glare of the lightning it came. It was time to say goodnight. Highly respectable Sir Thomas was the last to take a ceremonious leave of the wealthy host, and his example was eagerly imitated by the other banqueters. Arthur Talbot, who had been the first to come, was in effect the last to go, and he lingered, half unconscious of his motive, in the vague hope that Sir Pagan might say something to elucidate the mystery that brooded over the present relations of the two sisters. But nothing was farther from Sir Pagan's thoughts.

“Awwfully kind of you to come, Talbot, at such short notice,” and the baronet, looking ruefully around him, and surveying, with a sort of inhuman disquiet, the ruins of the feast in the shape of cigar ends, gloves huddled together, and dessert dishes in confusion. “And a dreadful bore, I should think, you found it, old man. I know I did.” “Thought it would never be over. The fact is, dear boy, I’m not the man to do this sort of thing, any more than I am to be Lord Chamberlain or Astronomer Royal. At the same time, it’s difficult—light another cigar—No!—Then good night!”

And so they parted, Arthur walking home to his hotel, drawing the end of his own involved thoughts. And at last sleep came to him, and he dreamed that he was in Egypt again, the old Egypt, not the new, one of a trembling

crowd gathered around the awful beauty of the colossal sphinx, and in the stern, sunken face, as it turned towards him with macabre eyes, he recognised the features of Madame de Lalouze.

# THE DRAMA IN TATTERS

To begin at the beginning, — an axiom of mine which I am never tired of repeating, and why should I not, in mentioning the theatres of to-day, begin with the 'grit'—Anglo, penny theatre, that time honoured institution which was at once the solace and amusement of my boyish days—for the enjoyment of which I have frequently sacrificed the gross amount of the last 'tip'. Of course, my frequent visits to the 'Temple of Variety' were made in secret, an additional ingredient to the stolen delights. To preserve my credit as a faithful chronicler, I must admit that the entrances to these temporary 'boyles of bliss' were almost invariably up a court or at the end of a yard, in the innermost recesses of which, adjoining a garaging entry, a long bill and a strong bill—painted by hand all the colours of the rainbow—was exhibited.

Girted with the wisdom of the serpent, the leaves of the show spared no pains to coerce the nimble penny. The performances were pronounced to be unique, and notes of admiration were telegraphically scattered in every available space. The most important item was of course the announcement of the title of the play for the evening. For to it known that the proprietor of the 'Temple'—the which particular establishment I have now under notice—was a most liberal man, at least as far as 'boob advertisement' doth

go. He gave us an entire change of performance every evening and assumed, moreover, the office of 'guide, philosopher and friend, by investing with a distinctive epithet the name of each actor and actress in the programme, as 'the bold,' 'the comic,' 'the pert,' 'the lovely.' Now, as the company numbered only six persons—four males and two females—this perhaps was no difficult matter, and may be regarded as superfluous, still, it saved the audience a world of trouble. You were not called upon to investigate or criticise the conduct of the entertainment, but, like the clerk in the post-office, you were moulded into the proper form as you were conveyed to the oven above. I use the word 'oven' advisedly, for when packed in reptiles—so frequently happened—it was hot. To conclude with 'Comic Song' Admission One Penny. Vivat Regina!!! in capitals three inches high.

That delicious touch of 'Vivat Regina!!!' Every reader of the flaming placard repeated the words, but no one ever attempted an interpretation of them. The mighty bill of fare was subject to continual alterations, but we kept our 'Vivat Regina' to the last. I have endeavoured thus far to present the reader with an accurate account of the condition of things on the outside of the 'Temple.' We will now, if you please, step within.

Having contributed the necessary admission fee to a gentleman at the door, who is balancing himself on a wooden leg, we go up a flight of very steep steps, at the top of which we encounter another gentleman, known by the name of

'Truby,' from his presumed avocation as a retail dealer in the finny tribe. You could scent him a long while before you saw him. In spite, however, of this drawback, he was a general favourite with the frequenters, from his kindly manner and genial flow of humour. Passing through the folds of a remnant of old sailcloth, I found myself in the corner of a large, lofty—partly coveting a row of stables—stables unmistakably, from the occasional clumps of hard horse, and the fragrant odour which proceeds therefrom—a little below the level of the foothills, and on the far side of the stage. There are no reserved seats whatever. From the raised platform to the outer walls are a number of rough planks ranged lengthwise, rising one above another as in an ordinary gully. In the topmost corner on the right hand is a small inclosure, with a counter, devoted to the sale of 'oranges, apples, and ginger beer.'

The arrangements behind the curtain are primitive and simple. There are four tolerably well painted scenes hung upon rollers, comprising an exterior, an interior, a wood, and a street. The brickwork at the back of the stage is coloured to represent a landscape. Wings there are none, but the proscenium—three feet wide on each side—being fixed parallel with the walls, offers some slight protection to the actor, in their entrances and exits. The musical element was sparsely represented, one instrument only—a violin—constituted the entire orchestra. One, of course, was unavailable, and another went to insignificance, the authorities therefore resorted to the use of a fearful compound of grease and oil, the fumes of which were sufficient, five pints, in shape like huge garden snails, were filled with the precious liquid and placed at intervals along the edge of the platform, to do duty as 'flats.' Sometimes the business of the drama required a night effect, this was managed by means of a long strip of cloth, fastened to the stage by hinges, but lying flat thereon, until the appearance of the bloodstained spectre on the pillow, then rolled for darkness, when, by the aid of a cord attached to each end, it was raised, and the necessary result followed.

It should be mentioned that there are three 'houses' or performances nightly, each of which lasts about an hour. The reader is supposed to be present at the first of these, viz at seven o'clock. By this time the audience has increased in number to at least three hundred, and the noise they make is deafening. 'Stop it, old catgut!' 'Pull up the rag!' 'Now then, look alive! As before the curtain rises, however, it may be as well to mention a little peculiarity attaching to the dramas enacted here. To-night we are to have *The Highland Gal* run to-morrow, perhaps *The Outlaw*, and the night following, *The Firebrand*. Thus with variation—barring on the same old string—we at last arrive at *Rob Roy*! so that in reality the 'change' every evening is a delusion and a snare. 'The bill is—' 'Order, order, or dar!' is vociferated loudly as the curtain rises, and we are supposed to be transported to Bonnie Scotland. The prison scene in the Tullibeech is represented by a cottage interior. Instead of the 'practicable door' hung with chains, we have a latticed window liberally garnished with flower-leaf shrubs.

The Cateran enters, followed by the Baith The 'bold hero (vide bill)' drew oddly enough—his head covering is a faint copy of the same honoured billycock, and his garments are a modern suit of fustian much discoloured, whilst about his legs curl wisps of straw, and he walks with a slouch. Taken altogether, his appearance suggests the idea of a crown betwix a dog-fancier and a scavenger. He speaks such a voice! Shades of James Prescott Wards and Thomas Archer, could it have been possible for you to have revisited the ghastly of the moon, your immaterial shadow must have shivered in dismay—toned deep as the funeral bell of old St Paul's or Bevilin, it may be, the angry boom of the lining, thus as it rolls about the heads of the central hills. Still, putting aside the incongruous costume, there was stuff in the man. He did not 'munch' the part, as my poor old friend Jack M.—n—t, went to do that of Rashleigh, but treated the matter tenderly, as though he loved it. Strange to relate, I met this same individual, twenty years after the above performance, in a small printing office in the City, 'composing stick' in hand. The calling had changed in the interval, but the well-remembered voice was as full and as resonant as ever.

Billy W—, the renowned 'Cateran,' was an immense favourite, nothing he could do, or did, came amiss to us, but I doubt if his conception of the part of the Poole would have been greeted with so many warm approval, had our knowledge of the original been more familiar. The dialect was dropped altogether, and the canny Glasgow weaver himself so informed, that his most intimate friends would have failed to recognise him. The eccentricities of costume were never better exemplified or more fully developed than by Billy on this occasion. All the most attaching to originality was his. His personal decorations were so florid as they were inaccurate. A fore and aft cocked hat and feather, surmounted the most whimsical face you ever saw, an oil-bob-tailed milch cow, decorated on one rim with three good conduct stripes, was closely buttoned at the chin, but being a world too small in the region of the chest, the end of a belt was required, one of those so much effected by the stage British tar—a broad, black, leathern band, with a huge brass buckle. His nether limbs were clad in corduroy shorts, supplemented by a pair of Wellingtons. Anything more ludicrous cannot well be conceived. But the crowning point is not yet reached. In the scene where Helen receives tidings of the capture of the Chief—the news being brought by Rashleigh in the disguise of a gillie—and the 'Lament' is recited, he gave vent to his grief by trolling forth the rollicking popular ditty of *All round my hat*!

My impression was—and it remains to this day—that the before-mentioned Jack M.—n—t, on being cast for the part of Rashleigh, determined to make it the most prominent in the piece, and he did! Drawn in the costume usually worn by the third robber in the *Miller and his Men*, he looked superb, and his shouting was terrific. But his grand coup was to be brought about later on, as we shall see.

The fourth and last remaining male member of the company, Mr Herbert Montague, deserves honourable mention, not perhaps on account

of any extraordinary aptitude he displayed, but for the profound mystery which surrounded him. Nobody seemed to know precisely who or what he was. His appearance was eminently prepossessing. Tall and well made, he carried with him the air of a gentleman. He certainly claimed no parentage in the salubrious neighbourhood of the Lower Marsh. That he lived 'over the water' was strongly inferred from the fact of his having been met on one occasion crossing Waterloo Bridge in a cab. It therefore naturally occurred to us *habituees* that he was connected in some remote way with the titled aristocracy of the West End, but as no evidence in corroboration of this popular belief was ever forthcoming, it is just possible there was no truth in it. Anyway, the fact remains that he was always better clothed, both on and off the stage, than his fellows, that he never appeared *à la* without money—this was a most remarkable feature, and that, moreover, our curly doorkeeper—he of the wicker log—always touched the rim of his broken bowler in deference, whenever he passed in or out. Mr Herbert Montague—there was a flavour of the 'upper ten' even in the name—who 'doubled' the parts of Francis and Captain Thornton, was not as yet in possession of the powers of a Mercury or a Kern, indeed, to put it mildly, he could not yet *do* all, yet was there a certain propriety in the delivery of the words set down for him, beyond that, an innate love of the truth led me to see that he was a stick, a stick of sticks!

Lady a provident housewife, who, careful of her store of newly gathered fruit, carefully selects those that are damaged from others that remain unharmed, so I, having disposed of and set aside the minor articles, come now to discuss the merits of the chief and best! Our leading lady was a very far from perfect, shining particularly in pathetic parts. She endeavoured to make every character she undertook fall into the tearful groove, had the 'melting mood' ready at the slightest hint, and sometimes without. But perhaps the most singular thing in connection with this Ishyrmaw obligato was this—the fits of emotion, however prolonged and powerful, never affected the uniform in a sympathetic way. Not that we were insensible to the due presentment of sorrow or pain, no, far from that, I fancy that most of us had been life-long companions with these, in addition to cold and hunger, the secret of our apparent want of feeling arose not from callousness, but it occurred, but through the too profound contemplation of the eccentricities of a 'swirl' eye! the owner of which was the wife of the Macgregor. In the lighter or more level scenes, this defect was not so prominent, and *for* a latent sense of its utter incongruity, would have saved a laugh, but when, in the more vehement parts, her excitement increased, the vocal organ grew so restless and so fearfully 'swirly,' that we were reduced to a state of coma, quite subservient of anything like applause.

Last, 'though not least in our dear love,' comes pretty Mary L—, the pert scoubie, in private life the wife of our leading man, and the mother of three little ones. In those early days, I pictured to myself no larger form of female beauty. As bright and as lively as a spring

morning, she never approached the front without a welcome from our ready winks, whilst her cheerful laughter lovingly set us all aglow with merriment. As Dr. Vernon and Hannah, there was small opportunity for the display of her peculiar talent, but her main presence seemed to add a beauty to the scene which had lacked before. With true womanly tact, she treated us always as children, as indeed we were, never smiling her sweet lips with a double meaning or a cant phrase. No matter how noisily her companions were occasionally greeted, she was always received with the utmost sobriety and respect, indeed, we looked up to her as something better than ourselves. If there was anything like an approach to an uproar, it was instantly quelled by an entrancing word from her, and sometimes she would promise us a song if we were 'good.' Unbearded and untalented as we were, without the slightest hint of that technical knowledge which comprises a musical education, we took full our delight at the announcement by repeated shouts and bravos. Of Jenny Lind, who just at this time had reached the zenith of her fame, we knew nothing, (except by reputation), but we had our own private opinions as to whether our dear favourite could not, if opportunity offered, speedily take the shine out of her.

The drama concluded, Mary would come to the front, accompanied by a few premonitory bars of the air—from the violin—with which she was about to favour us. I fancy that her repertoire was limited to two songs, perhaps because I never heard her sing any others, but they were gems of the purest water. *Home, sweet Home*, and *Wapping Old Stile*. Altogether with our rustic training, the little woman would have a positive triumph in the rendering of these plaintive melodies. The tender and capricious tone with which she uttered the word 'Home' mixed it with a new meaning, so exquisitely touching, that the tears would fall unawares, and transform our sadness into a sweet sorrow.

Now that I have adverted to a few of the strong points and failings of our very select histrionic tripe, we will, if you please, revert to the closing scene of the drama. 'From information received, we had learned that the hero had fallen into the hands of the ruthless Baron, and that the rest was undisputed—hence the 'Lament.' At the conclusion of Billy W——s well-chosen and appropriate ballad, we were suddenly surprised by a loud cry of 'Grege! sch!' as the cowed Onslow bounded upon the stage armed with one of those short belted linked swords, so precious, and so well remembered by the transpontine youth of fifty years ago. Each length, who stands in the opposite corner, defiant and determined, is armed with a similar weapon. He knows perfectly well that the hunted Highlander has 'come' for him, and although his foot is not upon his native heath, he evidently means to do or die. The stage has been cleared to the bare wall at the back, and all superfluous articles of dress removed, and the combatants proceed to business in the most leisurely manner, keeping time and step to the tune of *Lodowick*. This is Jack M——s grand opportunity. If in the very nature of things theatre, he cannot be the leading man, he will at least retaliate by being to that exalted individual a terror and a punishment

to the latter end. His work is storms, the minor battle assumes a terrific character, the flashing blades quiver in the mimic gleam of the grease pots, as the deadly combatants chase each other round and round to the hurried notes of the instrument Jack takes himself into a state of furious excitement difficult to behold, as he aims a tremendous blow at his opponent's head, thus the picturesquebert avoids by stepping aside, while at the same instant he passes his sword up to the hilt below the uplifted arm of his antagonist. Under ordinary circumstances, this thrust would have been sufficient to give the quietus to 'any man of woman born.' Not so with Rastletch, he, like the proverbial Englishman, did not know when he was beaten, he merely gripped a mighty 'Oh!' and staggered to the wall, waiting events.

It was very clear to me that if the Caterin did not quickly dispose of his enemy, the result would necessarily entail in the accomplishment of that desirable object would be too much for him. A truce, therefore, was hastily agreed upon until sufficient breath should be recovered to continue the fight. They landed each other from opposite corners. Jack's contusions, owing to the wound he had received, were terrible to witness. We incline to the belief that it would be a mercy to smother him out of his mind, and so end his sufferings. But it is not to be so. One must be piked upon Pison. The Mat, I could plainly see, was a k and I used of the whole thing. As knew that this (clarifying) amusement would have to be repeated three times during the night, and he wanted to get off and rest. You see 'Jack's delight was Mrs's pain, and Jack knew it.' The stage was in his power now. 'We be to forego some of his finest efforts for us a Rob, forsooth, we are not so strong in the arm as he was.' The fair forbids!

During this short interval Jack had managed to come off with means to lighten his face and place there some additional marks of the bloody fray. Once more do the substituents approach each other. Jack, through sheer weakness, falls on one knee, looking as vicious as a wounded rat. Now mount Rob, in whose liver a wealth of numbers has hidden, disdaining to take a mean advantage of a fallen foe, descends to the same level. The contest now continues languidly for a minute or two in this position—each on one knee. Voluntary apoplexy shakes the roof-tree as Jack, with quickened energies, makes a superhuman effort to rise to his feet. This movement he accomplishes after a severe struggle. Standing erect, he shouts 'Come on!' This invitation is responded to with alacrity by the 'W——' or who 'comes on' with vigour, and at once, without more ado, renders him another still, which apparently goes clean through his liver, as we detect the end of the blade at his back. This thrust so dully given attiles our friend's little business for a period, and he falls prone upon his face in the centre of the stage. The remainder of the characters, male and female, now enter from each side, and the entire scene is glorified by a blaze of red fire as the curtain descends slowly to the mournful melody of *Auld Langsyne*. Jack is called to receive the unanimous plaudits of the entire house, these he

accepts with a ghastly smile as the hero of the evening, and retires to enjoy a whiff of the fragrant weed and a dram, &c. &c.

Thus ends a chronicle of the Drama in Tatters.

## OUR NEW MANAGER

IN FOUR CHAPTERS.—CHAPTER I.

A SHORT half-hour's walk from Sandmouth—a large seaport on the southern English coast—lies the secluded village of Bithfield. It is but a small place, and may fairly be described as secluded, for although so near a large town, yet lying, on a narrow road between two other towns—whilst there were many of great importance, and are now shorn even of this by the railways—Bithfield seems to have grown lumber and quieter than ever.

A little outside of the village, and between it and the town, stood Fernow Cottage, the residence of Mrs Vallens. This it had was the title by which she was known to the few persons—her Irish maid except—who had occasion to speak of her, but it was given principally on account of her mature age, for she was past middle life, and in a sort of complement, rather than implying the commonest part or proof of, a Mrs Vallens. She lived a retired, solitary life, and was so reserved in her manner as to repel the few residents of Bithfield who had sought her acquaintance. So reserved was she, that no folk save that of her own servants crossed her threshold month after month, but at the opening of our story, an incident occurred which changed this monotony in some degree.

When Mrs Vallens walked out, she usually selected the least frequented path, and with her deep double veil screening her face, her features were almost invisible to the few persons whom she encountered. One afternoon she was following a by-path which led across some fields to a farm-house and cottages, when she came suddenly upon a spectacle which startled her. At the foot of a large tree stood a pile of some eighteen or nineteen years, supporting a boy, a mere child, clad in the commonest rustic garb of the neighbourhood. His was evidently worn sick, and as the dress of the girl was stained with blood, and the face of the boy was also marked, it was clear that he had received some injury.

The girl was holding a small scent bottle to her nostrils, and on hearing a step, looked up. 'Oh, I am so glad some one has come!' she exclaimed. 'I saw this poor little fellow fall from the tree, and when I came up, his forehead was covered with blood, and he was quite motionless. What can we do?'

The mysterious lady of Fernow Cottage immediately dropped on one knee by the side of the nurse and her patient, then with dextrous and gentle touch, examined into the injuries the boy had sustained. 'He is not very seriously hurt, I think,' she said, 'and if you will hold him until I bring some water—there is a spring just here—he will recover—You are not afraid?'

'N—no,' said the girl. 'It is very dreadful

to look at all this blood, and to see him looking like death, but I will hold him.'

Without another word, the elder lady disappeared, but returned almost immediately with her bosom filled with water—greedily to the younger lady's horror, for she, after the manner of her sex, had noted the costly materials of which the article was composed. The water was sprinkled over the boy's face. He almost immediately awoke and opened his eyes. The elder lady drew out her handkerchief, with which she bathed his brow and washed away the clotted blood, then bound it carefully round an ugly cut which the grooves had rendered plainly visible.

By this time she had could speak, then with an effort he stood upright, and was able to explain that he lived in one of the cottages by the Lumbooms, that he had been bird nesting. The rest she knew more about than himself. By their assistance, the lad was enabled to walk slowly towards the farmhouse, until the party met a labourer who knew him, and kindly took him in charge.

Relieved of this care, the younger nurse had an opportunity to contemplate and bewail the really unsightly blotches on her light coloured dress, the bleeding of which, or the reaction natural after her excitement, afflicted her to tears, which had in them a strong suspicion of hysteria.

'Come to my house, my dear child,' said Mrs Vallens, speaking with a softness and tenderness for which few of her neighbours would have given her credit. 'It is close by, and as I must send a servant into the town to ask Dr Wright to come out to the farm and see the boy, she shall call upon your friends and bring another dress for you, or I can lend you one, whichever you please.'

'But your bosom is spoiled,' said the girl, through her tears, 'and such a beautiful bosom too!' Then remembering that a question had been asked or implied, continued, 'I should feel sad if you could end worse, and yet it would frighten my mother so much!' No, I had better go home. I live in Bithfield, in the Lower Down Row, my name is Darnett—Marian Darnett, and—'

'I know you, Mrs Darnett,' interrupted her companion with a quiet smile, 'although you perhaps do not know me, and as we are now close to my house, we had better go in and dress us upon our plans.'

This was the beginning of an intimacy between the reclusive proprietress of Fernow Cottage and Mrs Marian Darnett, two beings as opposite in their appearance and, one would have supposed, in their tastes as could easily be found. For Marian was rather shy and timid, yet frank and cheerful whilst she had hard too, by local gossip, of Mrs Vallens, and held her in the same dislike, almost dread, as did most of her neighbours. She found, however, that while Mrs Vallens still held the same repellent front to all others, she was so kind and gentle to her, and welcomed her so cheerfully to her home—though never could she be induced to return the visit—that Marian felt sure she had been secretly pining for companionship, and was thankful for the chance which threw them together.

Solitary and secluded as had been her residence at Fernlow Cottage, Mrs Vallens must have exercised the proverbial quickness and closeness of a woman's observation, for Marian soon found—greatly to her confusion at first—that this lady was fully acquainted with her intimacy with a certain good looking young fellow, Phil Hartley, a clerk in the shipping and general mercantile firm of More, Keelby, & Co, one of the principal houses in Sandmouth. When Mrs Vallens had shown how far her knowledge extended, and her kindly manner had won Marian's confidence, she was evidently pleased to lead the latter to speak freely and to receive the little confidences the girl had to impart.

Having commenced our story as it were in the middle, we are debarred from making the usual detailed explanations in regard to the positions and antecedents of our characters, for this reader should be thankful. We shall merely say, in reference to Marian's friends, that they were in a respectable although not extensive way of business in the town, living as being chequer and pleasant, in the suburbs. Of Mr Philip Hartley, Mrs Vallens had a pretty accurate knowledge. He was the son of a surgeon who had owned one of the best practices in Sandmouth, but he—the surgeon—was an easy going, careless fellow, clever enough in his profession, but not in much else besides, so, when he died, at the age of forty or so, his only son found himself with no provision and no property. He was, however, a clever, energetic young fellow, by no means disposed to sit the bread of idleness. Having, by the help of friends, obtained a clerkship in the house of More, Keelby, & Co, he worked with such a will, that he soon obtained promotion, and was now looked upon as the most rising man in the establishment.

The proprietress of Fernlow Cottage encouraged Marian to speak of the young man, and took pleasure in her little history. Provocative and conspicuous is such a history would have seemed to many, yet there is a halo of romance inseparable from the plainest love story, which is dear to woman, even when she is married and burnt like, as Mrs Vallens. Not that Marian would now ever allow that there was anything in the least degree harsh or repellent in the temperament of her new friend. It was only manner, the young lady contended—the effect, she was certain, of some early sorrow. Perhaps, Marian used to think, and sometimes say to Philip, perhaps she had once loved as they loved, and had been less happy, thus, in her turn, weaving something of romance about the lady.

One evening, some months after the incident just related, when spring had grown to summer, and summer was fading into autumn, Phil Hartley called at Mr Dunnett's house, in the Lower Down Road. This was an unusual circumstance with him, but on this particular evening he was to take Marian to a schoolroom hall, where was to be held a rehearsal for a certain local concert, at which the young lady was to sing. She had a voice at once sweet and powerful, and which had been well trained. Although she made no claim to be a finished vocalist of the operatic pattern, nevertheless in ballads and songs she was very attractive, and as it turned out, this concert became something like a turning

point in her hitherto quiet and unobtrusive life.

On this night, too, Phil was full of news, the changes which had been spoken of so long in the great house of More, Keelby, & Co had at last taken place, the style of the firm would be preserved as hitherto, but old Mr More would retire, and a new partner would come in—had come in, he understood. This was Mr Pike, a gentleman of immense capital, and still more immense business capacity and energy, so Phil was informed. He was to be the managing partner, the ruling spirit everything, in fact, and under his sway, the firm might possibly grow to tenfold its present extent. Then, when Marian was talking by his side to the rehearsal, Phil added a few sketches of these particulars, which he had not deemed necessary to draw before the family circle. This sketch had reference to the wider field opened to the staff of the firm by the change, than lateral positions, their early, and of course always happy marriages, and the possibility of some one of the number being selected to take charge of the account at the London branch of the house. If this were so, the delights of living in the metropolis might fall to the lot of Mr Phil Hartley, and his wife—that would be, and they, like all residents in the province, thought of London very much as we are told their predecessors thought of it in Whittington's time.

Much of the information apart from this sketch, which, as we have explained, was reserved for a select hearer, was earnestly discussed by Mr Dunnett, to whom it was as interesting as to Philip himself, as the former did what was, for him, a large business with the firm, and it was of importance that he should know whether certain facilities for transacting this business would be increased or diminished by the change. Philip took a very sanguine view, being his conclusions upon the character which had preceded the new partner, who was said to have no old-fashioned notions which would impede and retard the business, such as Mr More sometimes laboured under. No, he was one who liked the custom to go ahead, the faster and further the better. There were evidently agreeable tidings to Mr Dunnett, and he was as thoroughly prepared as Philip himself to rejoice in the coming of Mr Pike.

Both before and after the rehearsal, which was but of short duration, this kind of conversation prevailed, and Philip having seen Marian to her father's house, left in even higher spirits than he came, in the prospect which the advent of the new partner opened to himself and his friends.

Phil's home was in Sandmouth, and as he entered a suburb of the town, he heard the sound of angry voices, and, turning a sharp angle of the road, came in sight of the speaker. A gentleman on horseback was engaged in altercation with a man at the roadside. The latter was holding some object in his arms, in the darkness, Philip could not at first accurately make out what this was. Two or three men from a neighbouring barhouse had come out at the sound of the voices, and stood looking on and smoking, with but a languid interest, as no chance of a personal conflict seemed likely to be evolved.

The man on the footpath was a low looking, slabbily dressed fellow, not of the rustic or labouring type, but rather of the 'fresh townsmen' order, being indeed just the man upon whom a police officer's eyes would turn by instinct.

'That's a lie, and you know it, he said bitterly, in continuation of some earlier comment. 'The dog was trying to get out of your way, tell you but him with your whip and drive the poor brute under your horse's feet. I wish I had you off your horse out on the Downs here, I would give you something to remember him by.'

'Why, I have seen you before,' exclaimed the gentleman. 'Now you move into the light, I recollect you.' The man shrank back a pace or two here, so as to avoid the rays of a gaslight which shone from the neighbouring beerhouse. 'Oh! you need not shrink back,' continued the horseman, 'I know you.' I saw you on the race course yesterday. You are a thumbler, a thief, a card man, and a pickpocket into the bargain, I have no doubt. If I could see the police sergeant now, I would have you locked up at once.'

A murmur from the lookers on implied that this was not fair fighting, and had nothing to do with the points under discussion.

'Look here, sir,' said the man, encouraged probably by this token of sympathy, and turning to Philip as the most important member of his audience, 'you see this poor dog?—he opened his arms as he spoke, and showed that what he held was a little brown dog, dying or dead, so Philip judged from the helpless manner in which it was lying.

'Poor fellow!' said Phil, in the pitying tone one instinctively falls into on seeing a suffering dumb animal.

'Are you one of the gang?' demanded the rider, who was clearly not distinguished for good temper.

Phil looked rather anxiously up at the speaker, and met his eye. He was a man of middle age, dark complexion, and with remarkably strong whiskers, while his eyes were keen and unflinching. '—No, thought Phil, he is not then in a single glance by the gaslight. 'I know no more of a gang than you do,' retorted Phil. 'I am only sorry to see the poor little dog in such a state. The man seems fond of him, and you cannot wonder if he feels its loss.'

'He should feel something else, if I had my will,' returned the horseman, 'and if you are not one of the gang, you had better be careful how you pick your companions, for if I meet a policeman, I will come back with him, as you had better clear off.' With this he put spurs to his horse and was out of sight directly.

'What made him so terribly out of temper with you?' said Phil. 'Had you had much of a quarrel before I came up?'

'Yes; we just about had a row,' said the man. 'He killed poor Tiny, and he did it on purpose. If we had been in a quieter place, out on the Downs, for instance, I would have put him.'—The man did not finish his sentence.

'What made him say you were a cardsharp and so on?' asked Phil, who regretted the indiscreet question the moment he had asked it.

'What made him say it?' echoed the man.

'Why, because I saw one, that's why. I have been working the race meeting down here, but with better luck. I have tried the cards; I have tried the potting trick, I have tried all I know, but couldn't draw a coin from the stung chawbones about here. I lost every shilling I put on the horses, and now me and Tiny was on the tramp, and this pipe of tobacco what I was smoking was the last I had got, and neither me nor Tiny knew where to get our supper to night nor our breakfast in the morning. But we had been in such a fix before this, and I would have gone without a meal for myself—and have done it, mister—before Tiny should have gone without his, and now he's dead. I always had a friend while he was alive, and now'—The tramp, for such he clearly was, faltered in his speech here, and under pretence of pushing back his ragged hair, Philip saw him draw the cuff of his sleeve across his eyes.

The young man hesitated a moment, then drawing half a crown from his pocket, offered it to the other. 'Here is not a great deal,' said Phil, 'but it will help you to get a lodging for to night, and to-morrow something may turn up.'

'Well!' exclaimed the tramp, after a pause of astonishment, 'I didn't expect this, mister—I didn't intend I'm very much obliged to you for it, but if you think I was working the race for this, in telling you what I did, I'm blessed if I want it. I don't really sleep in a den as nothing fresh to me, and I shouldn't like you to think, though I am a thumbler, that'—

'O nonsense!' said Phil, 'I give it to you for poor Tiny's sake. I am fond of dogs myself, so I quit undrest and your sorrow at his death.'

'Thank you, mister, I thank you kindly for this half crown,' said the man. 'But though you've got a feeling about it, you can't understand what I feel at losing this dumb creature. But if ever I get a chance of acquiring it with that fellow'—

'Come! don't talk such dangerous nonsense,' said Phil. 'I dare say he has forgotten all about you by this time, at any rate he did not come back with the police. You know you ought not to talk like that.'

'He's a bad one—a rank bad one, spite of his home and his swell clothes,' retorted the other, 'and always was.'

'Always was!' repeated Phil. 'Have you ever seen him before?'

The man looked at Phil with a curious smile before replying, then said: 'Did you see me move out of the light when he said he knew me?—You did. Well, I didn't want him to recollect too much. Proper he did see me on the racetrack, for, I tell you freely, I have been there with the cards, but please he did not. It's just as likely he only thought he did. Directly I spoke to him and told him my opinion, before you was there, you know, I saw a look come upon his face, as if he was trying to recall something he had seen or heard a good while ago.'

'Well, good night,' said Phil; 'I wish you better luck and a better trade. Out out of Sandown with anyone.'

'Good night, master, and good luck to you,' said the tramp. 'As to my trade, it's pretty near all that is left to me. I think I saw you in a certain warehouse to day; and if I am right, you will find there are people in other trades quite as bad as me. But you've got a kind heart, mister; and if ever I can do you a good turn, I will.' And with this, they parted.

## A CHINESE FUNERAL.

I WAS disturbed one day during my mid-day meal at Hong Kong, by a commotion in a street adjoining the one in which I was residing, caused by a Chinese funeral of more than the usual pretensions. As very little is known among foreigners, even those residing in China, in regard to 'celestial' obsequies and their meanings, I took some trouble to gather information regarding the strange pageantry which I that day witnessed.

It is the general custom in China, when a man is about to die, for the eldest son to remove him from the bed to the floor of the principal room of the house, where he is laid with his feet to the door. The inhabitants of the province of Fukien are in the habit of placing a piece of altar in the mouth of the dying person—with which he may pay his fare into the next world—and carefully stopping up his nose and ears. In certain cases they make a hole in the roof, to facilitate the exit of the spirits proceeding from his body, their belief being that such person possesses seven animal senses, which die with him, and three souls, one of which enters Elysium and receives judgment, another shades with the tablet which is prepared to commemorate the deceased, and the third dwells in his tomb.

Whether all these practices are observed in Hong Kong, I am unable to say, probably the setting open of the windows and door is regarded as a profitable proceeding to making a hole in the roof, more especially when the death happens to occur in the lowest room of a third-storey house. Here, however, as elsewhere, the intelligence at the death of the head of a family is communicated as speedily as possible to all his relatives, and the household is dressed in white—the mourning colour of China. Priests and women hired to mourn are sent for at the same time, and on their arrival, a table is set out with meat, fruits, lighted candles and joss sticks, for the delectation of the souls of the deceased, and the wailing and weeping by the mourning-women is relieved at intervals by the intoned prayers of the priest—the discordant 'tom tomming' of 'mourning' who have also been called to assist in the ceremonies. The women wail and lament with an energy and dolefulness which, if genuine, would be highly commendable, but ungenerous 'barbarians' of extensive acquaintance with the Chinese assert that this apparently overwhelming grief is, at least in the majority of cases, mere sham. In regard to the nearest relatives of the deceased, it would be uncharitable to presume there is not a considerable amount of real grief beneath all this weeping and wailing; but hired mourners, who are usually the most demonstrative on these occasions, can hardly be expected to launch every

other day into convulsive lamentations of a genuine nature over the death of individuals they hardly know by name. As it is, the priest usually directs these emotional demonstrations much in the same way as a conductor controls the performance of a band of musicians: now there are a few irregular wails, then a burst of them, relieved in turn by a few wail notes from the priest, the intervals being filled up by the 'tom tomming' and an occasional titter from the latest comers.

One of the strangest features in the obsequies I witnessed was the erection of a structure in front of the house, in which the death occurred, to enable the confined body to be brought down to the roadway from the room in which it was lying. The house being a third-storey one, and the body lying in one of the topmost rooms, the erection, which furnished a sloping footway of planks from the room to the road, and a landing at the top, had necessarily not only to be lofty but substantial. Communication was of course had with the room through the window. These structures are, I believe, erected for two reasons—first, because strange families in a house object, on superstitious grounds, to a corpse being taken through their rooms; and secondly, because it is almost impracticable to get a heavy Chinese coffin down the narrow tortuous stairs of many of the native houses. For a similar reason, no body in course of transportation from one part of China to another for the purpose of interment is allowed to pass through any walled town. No corpse, either, is ever allowed to be carried across a landing place or to pass through a gateway which can in any way be construed as pertaining to the Emperor. The Chinese are indeed so superstitious in regard to death, as seldom to mention that word itself, preferring to take refuge in a circumlocution, such, for instance, as 'having become immortal.'

What may be particularised as the public obsequies of the deceased, on the special occasion I refer to, were commenced by a procession issuing from the house on the mission known as 'laying the water' wherewith to wash the body of the deceased. First came the 'mourning' (save the word), then a priest, wearing a long robe of a dark red colour and a sort of college cap, and lastly, the white clad mourners. On the mainland, the procession would probably have repaired to the nearest river, well, or even the wet ditch of the city, for the water; but these antiquated customs being rare in Hong Kong, the mournful cortege on this occasion was compelled to wend its steps to the government hydrant at the end of the street. The leading actor in this ceremony of 'laying the water' was, as usual, the eldest son of the deceased, a boy about seven or eight years of age. Notwithstanding his youth, however, his part was performed with an earnestness that must have resulted from a considerable amount of previous instruction. Bearing in his hand a wand covered with white incensed paper, supported on each side by a female relative, and bending nearly double in token of his intense grief, this young son of the deceased proceeded slowly and gravely in the direction of the hydrant, the 'band' mourning while doing their best with the tom-toms and that close imitation of the Scotch bagpipe, the

Chinese pipe. Arrived at the hydrant, the party knelt around that useful apparatus, the 'musician' redoubled their exertions, and the priest his prayers; more incense was burned, and a tremendous burst of wailing and lamentation went up from the mourners. While these performances were in operation, the youth to whom I have just referred drew, with the requisite prostrations and solemnity, a basin of water from the hydrant, and then scattered a few coins on the ground by way of payment. It is essential in this ceremony that the water should be paid for. The procession thereafter returned to the house, where doubtless the body of the deceased was washed by the boy, in compliance with the custom of his country.

After the body of the deceased is washed in this manner, it is dressed in the best clothes which belonged to the man in his lifetime, a hat being placed on his head, a fan in his hand and shoes on his feet, the idea being that he will be clothed in these habiliments in Elysium, and consequently that he must appear there as a respectable and superior member of society. At intervals during these and subsequent ceremonies, gilt and silvered paper in the shape of coins and ruyse bars is burned, in the belief that it will also pass into the invisible world where it will be recognised into gold, cloth, sedan chairs, furniture, buffaloes and horses, made of paper, are transferred on the same principle to the 'better land for the benefit of the dead.

The body was now brought through the window and placed in the coffin on the stage at the top of the temporary wooden structure. It is the practice with the richer Chinese to keep the coffined bodies of their relatives in their houses for long periods, sometimes for years. This custom was not followed on this occasion, for the funeral took place immediately after the ceremony of 'buying the water.' Large sums of money are expended on coffins by the 'cultured,' and a dutiful son will see that his parents are provided with these material receptacles sometimes many years before their death. They are made of heavy boards, four or five inches in thickness, and rounded at the outer joints, and appear to invariably take the form, in this colony, of the polished trunk of a tree. Inside, they appear to be lined with a sort of mortar; the joints are all carefully closed with a similar substance, but a small hole is drilled through the coffin over the face of the deceased, so as to leave a channel of escape and entrance for the spirits.

It was a work of some difficulty to bring the coffined body down the steep footway from the window to the road, but the task was finally accomplished without mishap, amidst the renewed wailings of the mourning women, the shrieks of the pipe, and the labouring of the tom-toms. Awaiting the arrival of the coffin in the street were some twenty elaborately carved and lavishly gilded sedan chairs, constructed especially for use on such occasions. These chairs contained meats, fruits, and cakes—real and artificial—in profusion. Among other articles displayed were two excellently cooked sucking pigs. Two or three altarpieces, emblazoned with the name and age of the deceased, were also carried in the procession,

also banners, the deceased's tablet and photograph, and other articles—the banners all being dressed more or less in mourning costume. Before the procession started for the burial ground at Mount Davis, there was more wailing, more incense burned, more shrieks from the 'gusty pipe,' and more prayers from the priest. One of the last acts of the mourners was to walk round the coffin, and then the procession moved off, the coffin taking the last place in the cortege.

At Mount Davis the body was consigned to the earth with much lamentation, incense-burning, and praying. There was, however, apparently but little difference between the ceremony engaged in at the grave, so far as the priest, the mourners, and especially the 'musician,' were concerned, and those earlier in the day. The deceased's tablet is carried back in procession to the house, and there set up in a room especially reserved for such purposes, with other tablets of the family. Before these tablets, incense is duly burned and prayers offered. The last carried in the procession is, we believe, commonly distributed among the poor, sometimes, however, a portion of it is consumed in the house.

The burial places are sometimes selected by necromancers, and if the family be rich, this selection is often made with considerable difficulty and expense. A good view for the entombed spirit is one of the chief requirements for a grave. The side of a hill overlooking water, a cove, or a river in a hill top, are highly favoured spots. About the 6th April in each year, the population of the country may be seen trooping out to their tombs to repair and sweep them and make offerings. A Chinese tomb in the south of China seems invariably, so far as the outline on the ground is concerned, to take the form of the Greek letter Omega ( $\Omega$ ), and when raised to any height, it usually much resembles a huge armchair with a round back, the coffin being placed in the seat.

### 'DANDY'

THE late Charles Dickens somewhere describes the relationship existing between dogs and the persons with whom they reside as of two kinds. In the one case, the owner may be said, in ordinary phrase, to keep the dog, in the other, the dog, being allowed its own way and much more, may be said to keep its reputed owner. Our own experience furnishes a third instance, in which no actual ownership existed, expressed or understood—nothing, but a tacit agreement or suffering on either side.

It was late on a wintry evening that the arrival of which we write first attracted our notice. During our many years of sojourn in the Scottish metropolis, we had no previous acquaintance with him, and it is probable that he made choice of our particular doorstep as a place of refuge in distress, for no other reason than that ours was the last house in the row, and because his strength did not suffice to carry him any farther. There, at all events, we found him, crouched as far out of sight as possible behind

one of the porch pillars, a filthy and shivering animal, apparently in the last stage of exhaustion. Hunger and cold had weakened him to such an extent that he was unable to do what he would otherwise have done, namely, to beat a retreat on being discovered. Too much accustomed to the brutalities of street boys, he at first rendered our friendly advances, but in a feeble manner, and it was not until we opened the door and admitted him to warmth and shelter, that he seemed reassured. Like the dog which Robinson Crusoe fetched from the wreck, he would apathetically have ended himself, had we permitted him, with the food he so evidently needed, but after a time he began to recover, and a prolonged series of ablutions—to which he apparently objected on principle—at last revealed him, literally, in his true colours. He stood confessed as a small and handy legged animal, which it were gross flattery

to compare him to any other. After some weeks, and when we had quite forgotten him, he suddenly reappeared, a shade less dirty, but as exhausted as before. Giving him one more chance, he remained three days with us, made another short rally out, returned next evening, and then stayed with us—he evidently found he could not do better—for eight years and seven months. We called him Dandy.

Apart from his natural inability to tell us of his antecedents, he was in many ways a puzzle to us for a long time. It was difficult to say in what sphere of life he had been brought up, or if he had been at all. He must have been only in a superficial manner. His single accomplishment—very imperfectly performed—consisted in standing erect on his hind legs for a few seconds at a time, in attitude which became him so wretchedly ill, that most people, not dog-lovers, viewing his ungraceful proportions, would have pronounced him, on the instant, a low bred whelp, while others, more discerning, would have added

credit of that famous breed, it must be added that he was, every inch of him, a cur of low degree, from the defective muzzle and the tattooed ears to a nondescript tail docked to some two inches in length—a plucky animal, and most probably a homeless outcast.

We had no dog of our own at the time, but nevertheless we were disinclined to adopt this ungainly specimen. In the past, we had been prudently proud of our terriers, they were uniformly animals of aristocratic appearance and faultless pedigree. Putting aside the chance of this one being claimed—not a very strong one, we intuitively felt—it was impossible, considering our traditions, that we could be associated, publicly at all events, with a dog of this degraded type. It was an understood thing, also, from the time that the long dynasty of dogs in our house came to an end, that none were to succeed them. The successive deaths of our former pets had so deeply affected the younger members of the household, that the illness had registered a mental vow that we were not to have any more dogs. We had thus no vacancy, and yet we were reluctant to set this poor wanderer again adrift. At last it was agreed, as a compromise, that he should be kept for a few days, in order that his description might be advertised. Notice was accordingly headed in the nearest police station, and an advertisement of his points—they were punisshably weak—inserted in the newspapers for several days. It must have been, we think, our low estimate of his market value which prevented us from giving the customary warning that he would be sold to pay expenses if not claimed. We did not, at all events, employ this threat. It is extremely doubtful, even if we had found a purchaser, if the price would have repaid us for the cost of one of the advertisements.

Perhaps it was the dog's own delicacy of feeling at causing so much irrecoverable outlay, perhaps it was only his restlessness, but, in any case, while in course of being advertised, he suddenly disappeared. Taking advantage of an open door, he had, we were told by an eye witness, fled precipitately. We were rather relieved by his

departure, however, was as pleasantly unexpected, as, through the mistaken kindness of our domestic, he invariably led us too much to eat. He was a gourmand rather than a gourmet, so he had little temptation. But we could not have trusted him if hungry, believing that from lack of early training he had no great depth of moral principle.

There were profound depths in him, nevertheless. At this recall, we believe, of having had to fight his own way from an early age, he was, in the vulgar acceptance of the term, 'deep'—principally shown in a surprising acquaintance with the ways of town life generally, and an easy familiarity with the thoroughfares in particular. Take him from one extremity of Edinburgh to the other, contrive to lose him in the most out of the way parts, and in all probability he was home before you had some short cut of his own. But as a rule, he preferred to ramble alone, and did so habitually. He always showed, however, a fine discrimination as to returning for the dinner hour. We think we see him yet, setting up the street, with his characteristic slinking trot marked by a slight limp, ever on guard against mischief boys who threw their empty buckets at him, and watchful for street Arabs who might have designs against his life, for this reason, affecting, when picturesque, the roadway rather than the pavement, generally a dog about town, and not to be taken in with its manners and piffles. He did not make friends abroad, was utterly deaf to the addresses of strangers, and had a custom, when meeting errand boys in the street, of making a cautious detour to avoid them, which was a sight to behold. Such was his outdoor temperament.

But—to use a stereotyped biographical phrase—it was in the family circle that his amiability shone forth, for he was ever in his affection also. Of all the dogs we ever possessed, he was by far the most human. Instinctively, he divined the character of those living in the house, knew well those who liked him, and those who were cold to him, and won, with all his plainness—and it was not little—the hearts of all the servants. To those attached to him, he showed

himself sympathetic with dog sympathy, and had the most unceasingly winning way, which was irresistible. To those who know what dog companionship is, it may suffice to say that he was a true and loving friend. Remembering his amiable traits, we cannot forget that his whim authorities were endless. A love for strong tea, apparently with him a familiar stimulant, now a futile pretence of searching for rats, of which he never caught one, a rooted aversion to being any one reading aloud, we amongst the list. For the last reason, I systematically shunted himself from family prayers, reappearing at their conclusion in the highest possible spirit, as in regard I, writer finally disposed of.

To the reader, it may appear singular that a dog so evidently well acquainted with the city, if he really belonged to my household within its boundaries, should not amuse me finding his home. Our own conclusion was that his owner, if he really had one, must have left the locality; otherwise his dog in his many wanderings would soon have discovered him. This proved to be the case, for we obtained literally one million, but only one, as to the dog's former career. It happened in this way. Taking a walk one day along a country road in the outskirts—with Dandy at our heels, for a week—we happened to exchange a few remarks with a working man walking in the same direction. He seemed to eye our dog with some curiosity, and at last inquired how we became possessed of him. We told him the circumstances. He laughed, and remarked, 'I've seen that one before. He's a well known dog that, sir, on the line.' 'On the line?' we echoed inquisitively. 'Yes,' he replied, 'on the North British Railway. They'll know that dog about the loco sheds at the Waverley Station and St Margaret's, I expect, if you want to take him there. Why, he was an engine dog, that.' So it seemed, indeed, for our informant went on to tell us that our Dandy had formerly been the companion of an engine driver, and that—a common enough thing—the dog used to ride with him on his trips. Further, that the man had for some reason or other quitted the North British Railway and the town, and, curiously enough, left the dog behind him. 'He's a sharp dog that, sir,' ended the narrator—an old-fashioned character.

That was all we ever heard about Dandy's former life. It was probably true enough. The estimate of his abilities was naturally correct. One thing is certain—a dog so wonted to find his way in the maw of the station traffic, and to play hide and seek between the wagon wheels, would be but inconvenienced with a lengthy tail. It might get him into mischief, and be in the way generally. It was probably on this account—if not as the result of an accident—that our Dandy had been prudently docked. This mode of life would also explain much of the dog's habitual restlessness. From a daily ride on a locomotive—no one can say for how long—to a settled town residence, must have been a great change.

There is little more to be told, but what remains is as mysterious as the beginning. Our dog grew old. Changes which might not formerly have affected him, now seemed to distress him. He grew strongly conservative, and when we

changed our town residence, Dandy never took to the new house, and went back to inflict himself on the tenants of our former one. Through old age or all temper, or both, he would not be comforted at home. One day he went out, which was nothing unusual, and never returned, which was quite unlike him, as he was essentially of a recurrent type. What befell him, we never knew. We alleviated his description widely, and mourned for him not a little. As he came, so he went, and he returns no more. We prefer, as he was old and putatively blind, not to speculate as to his end. We shall not readily forget him. There to his memory. We have never had a dog since.

#### THE BLIND BOY TO HIS SISTERS

My Sister, pray what is Light?  
I oft hear you say ye speak of the day,  
'I'm as bright as the bright;  
As I think I might be as bright as you then,  
Could I have a sight of Light.

Is it like an albatross' song?  
Does it warble alone, with the sweetest of song,  
Or is rung on high with a boned  
Like the swell of a chorus throwing o'er us  
Its enchantment's rebound?

Oh, and is it lovely then  
A fluttering measure of a sweet pleasure,  
Of joy a perpetual spring,  
The soul of devotion crying out to us,  
Hush, for ever on radiant wings.

It is in the flicker of a voice  
Like the curl on each of the lull in the sky,  
When the young girl's hour is a  
It is the cure which hope to bring us  
And I speak through my blind voice.

Or is it like the song of birds  
When they chant their loves and the depths of the  
groves  
Is melody sweet without words?  
Or the ripple of the rill, when the wind is still,  
Or the jubilee that paves the fords?

Ah, these are my fancies, I see,  
With that inward sight in my calm night  
Which tells me my Master of the  
But I know Light is real, though you cannot reveal  
Its precious nature to me.

You say 'you're really bright,  
But its glory and glow I never can see  
Till God shall endue me with sight  
And you pray this may be, when together we  
Shall enter His realm of light.

You I love as I loved my mother,  
Whose spirit has flown and left me alone  
To bloom and come to each other  
And how good you must be to pray for me,  
Your loving, but poor, blind brother.

## EXPLOSIVES

THE numerous outrages which have of recent years been committed by means of explosive compounds, as well as the many accidents which have taken place in their manufacture, conveyance, and use, have produced a general, though probably an undefined feeling of uneasiness in the public mind regarding such compounds. We believe nothing will convey so much to ally this feeling of danger in the legitimate use of these explosive compounds, as a knowledge of what they really are, and we purpose, therefore, in the present article to notice very shortly the preparation, composition, and chemical and physical properties of the most important of them. Explosive compounds, though very numerous, are but limited in their origin, that is to say, the oxidising or explosive tendency of one or two substances is so modified or increased in various ways, and by means of various mixtures of what may be called secondary substances, as to produce the almost endless variety of explosive compounds known at the present time.

For our immediate purpose, it will be sufficient that we divide these various compounds into two classes—namely, those explosive mixtures obtained by combining nitrate or chlorate of potash with different combustibles, and those explosive chemicals obtained by the action of nitric acid upon substances of organic origin. Of course, outside of either class are many explosive compounds, known chiefly in the laboratory of the chemist, such as the iodides and chlorides of nitrogen and the fulminates of mercury—used for priming percussion caps—and silver, but none of these, or others which might be mentioned, are known commercially, and certainly the majority of them have never been applied to any useful purpose, nor have they ever been named, so far as we are aware, in connection with any recent accident or outrage, so that we may dismiss them from the category of ordinary explosives. Many of these chemicals are, however, very explosive, the chloride of nitrogen,

for example, exploding with fearful violence at ordinary temperatures if it comes into contact with almost any combustible, particularly of a fatty nature, while fulminate of silver, for instance, explodes even when in the moist state on the least friction, and when dry, the touch of a feather is said to be sufficient to set it off. Practically, this very susceptibility to decomposition places such chemicals beyond the possibility of using them for any of the ordinary purposes for which explosive agents are generally required, and thus of itself puts a bar upon their manufacture, even where the risks are very much less than in the cases mentioned. There is, moreover, another element which operates, though probably in a less degree, to keep the majority of such dangerous chemicals within the confines of the laboratory—namely, the cost of their production (compared with those which we are about to consider, they, in short, prevent all the disadvantages of extra risk and cost in their manufacture, without a single compensating advantage in return).

When nitrate of potash or chlorate of potash is intimately incorporated with such substances as the phosphate of potash, or sugar, or starch, or flour, &c., a species of gunpowder is produced. Some of the substances named, probably all of them, when in a minute state of subdivision, and the particles suspended in the atmosphere, form an explosive element if they come into contact with an open flame. Thus, in fact, finds illustration in the way in which sheet-lightning is frequently simulated in our theatres, where lycopodium powder—the fine spores of a species of moss—is thrown into the air, and made to burn with a bright flash, and probably also accounts for many an explosion in flour mills and factories. Such substances, however, it will readily be understood, are not in the mass explosive. They may be subjected to any amount of friction or concussion, or a lighted match may be applied to them, without any result whatever. When mixed, however, with either of the potash salts mentioned, and particularly the

chlorate, a compound is obtained, violently explosive under friction, concussion, and heat. Such compounds have frequently been named white gunpowder, German gunpowder, and other fanciful names, according to the various incidents, or the relative proportions in which the ingredients are made to enter into the compound.

It would be tedious, and would, besides, answer no useful purpose, to enter into a description of all the potash compounds which have from time to time been manufactured or suggested. Much ingenuity has been expended in attempts to produce mixtures combining the maximum of explosive force with the minimum of risk. In addition to the substances already mentioned, they have been combined with spirit tin, with sawdust, with resin, and with various other substances, and they have also been produced in a variety of forms, such as in pellets, discs, and cylindrical balls, but in every case with questionable advantage. They are at the best a hazardous set of compounds, being liable in many cases to spontaneous combustion, exploding with the least friction or concussion, and in the case of the chlorate of potash compounds, unable to resist the decomposing effect of the slightest trace of free acid. Ordinary gunpowder, it need scarcely be mentioned, belongs to this class of compounds, the charcoal entering into this compound supplying the place of the combustible in the mixture just referred to. In this case, next to the proper proportioning of the three ingredients entering into the composition, very much depends on their intimate saturation in the moist state, and subsequent granulation, for obtaining the maximum explosive effect. Chlorate of potash cannot be substituted for the nitrate in a mixture of this kind, as it forms a dangerously explosive compound with sulphur. This may be shown by simply introducing a small quantity of each in a mortar, when the probability will be that they will explode in the process.

The second class of explosive agents mentioned—namely, that obtained by the action of nitric acid upon substances of organic origin—use a much more important class, not only because they are now in several cases extensively employed as invaluable aids to mining, blasting, and other operations of a similar kind, but also because they are in many cases largely used in the arts and sciences. They are all closely connected in their chemical constitution, though differing very materially in their physical characters. Picric acid, for example, one of the first discovered products of this kind known as a powerful explosive property, occurs in crystals of a beautiful light yellow colour, and is now extensively used as a cheap but useful yellow dye. It was originally obtained by the action of nitric acid on indigo, but is now commercially manufactured either from coal tar oils or impure phenol, a coal tar product better known as carbolic acid. When nitric acid is added to impure carbolic acid, a very violent reaction immediately takes place. On this first action ceasing, more nitric acid is added, and the mixture thus treated, to quicken the process of decomposition. On cooling and washing with water, to remove excess of acid, a yellow, intensely bitter mass is obtained, consisting of impure picric acid, known also as carbosetic

acid. This substance is explosive on percussion; but if mixed with nitrate and particularly with chlorate of potash, an exceedingly explosive compound is obtained, approaching in violence some of the most powerful explosive agents afterwards to be mentioned. This acid forms salts, such as picrate of potash and picrate of ammonia, which are also explosive, but which form much safer compounds with the potash salts named than the acid itself. Indeed, Professor Abel recommends a compound of picrate of ammonia and nitrate of potash as one of the safest explosive mixtures of the more violent kind yet discovered, and the same substance has frequently replaced nitrate of potash in continental gunpowders. Picric acid of ammonia also enters largely into many pyrotechnic compounds.

Gun cotton—technically known as pyroxylin—is probably the best known of all this class of compounds. It is prepared by immersing cotton in a mixture of sulphuric and sulphurous acids, if a white cotton is desired, or of fuming nitric and sulphuric acids, if an explosive cotton is wanted, and afterwards washing it thoroughly in water. The former preparation, dissolved in ether and alcohol, is largely employed in surgery and photography, the latter is extensively used for blasting purposes and for gunnery. Cotton after its treatment with the acids, and subsequent washing and drying to all appearance has undergone little external change. It has still all the appearance of ordinary cotton, although the rigidity of its structure is lost to a considerable extent, and it has acquired a very heavy feeling, which it does not possess. In the air, it burns with a flash, while ordinary cotton burns slowly. When exploded in a confined space, its force is variously estimated to range from two to eight times that of ordinary gunpowder, according to the saltness of the solution upon which it is based, and according also to its disruptive influence, and according also to its being prepared with stronger or weaker acids, which materially affects its explosive properties. With several minor disadvantages, among which the variation in the explosive force of the gun cotton is probably the most important, it certainly possesses many advantages over most other explosives, and particularly in this, that it may be stored in the wet state, in which condition it is perfectly harmless. Its explosive point is the dry state, under given circumstances of heat and pressure, but it is still in water to two hundred and fifty degrees Fahrenheit. Thus it may be stored in considerably under gunpowder, but a gun cotton explosive at this temperature is probably the exception, and three hundred degrees Fahrenheit may be considered as near the average.

Nitro dyocaine (also known as blasting oil), one of the most important, and one of the most powerful and dangerous compounds of this class, is produced by treating pyrocaine with a mixture of strong nitric and sulphuric acids at a low temperature. It is a heavy, yellowish, oily looking liquid, freezing at a temperature between fifty and fifty-five degrees Fahrenheit, is powerfully explosive under all circumstances on the least friction or concussion, and is said to have a destructive power at least ten times that of an equal weight of gunpowder. The extraordinary disruptive force which it exerts

makes it well adapted for blasting purposes in mines and quarries, but its extreme susceptibility to explosion from friction, and spontaneous decomposition, cause its employment to be attended with considerable danger. In fact, not a few serious accidents, involving great loss of life and property, have occurred in its use, and under no circumstances can it be said to be free from danger in its commercial form. The very freezing of the compound, which, as we have mentioned, takes place at an unusually high temperature, is said to form one of the greatest sources of danger, from the fact, that the fusion of the crystals in process of transport is sufficient of itself to cause explosion of the mass.

One peculiar feature of this substance is, that explosion of the mass will only take place on the application of heat in the event of the heat producing some chemical decomposition within the mass. A light may be applied to the surface of the nitro-glycerine, and it will burn with a flickering flame, the probability being that the flame would go out if the light was withdrawn. If the light, on the other hand, is insinuated into the mass, or if it is applied so as to cause any disturbing or decomposing influence, not on the surface, but in the body of the mass, explosion will ensue. Nitro-glycerine has been known chemically for a considerable period, but it is only so recent as 1864 that Nobel, a Swedish chemist, first applied it to mining purposes. Since then, it has come extensively into use, and has been much identified with Mr Nobel's name. He discovered that by mixing it with wood spirit it might be safely stored, being thus rendered non-explosive; other by percussion or heat. From the spirit, it can again be recovered by the addition of water, which precipitates the nitro-glycerine. In 1867, Mr Nobel made the further important discovery, that its explosive tendency and power was not reduced by adding it to other substances in themselves quite inert, while the addition of such substances in several respects made it safer for transport and use. This at once led him to produce a new compound, which he named dynamite.

Dynamite, it will be understood from this, is nothing more or less than nitro-glycerine with a certain amount of inert matter added, which changes somewhat its physical appearance, but not its chemical or explosive properties. Various substances have been added to nitro-glycerine, and fanciful names, even to the extent, but the substance originally added to it in the production of dynamite, and which has in every respect proved the best adapted for the purpose, is a kind of porous silicious earth, known in Germany as *Kieselguhr*. This substance absorbs the nitro-glycerine, so that when in the proportion usually adopted in its production—namely twenty-five parts of nitro-glycerine to twenty-five parts of *Kieselguhr*—the consistency and appearance of the dynamite approach that of newly bleached flour without the adhesive properties. In short, this earthy substance does to the nitro-glycerine what blotting paper does to ink, but inasmuch as the nitro-glycerine is of an oily nature, and requires to be in considerable excess, it was found that with increase of temperature, and under other circumstances, such as slight pressure, the nitro-glycerine was apt to exude from

the compound. To obviate this, dynamite has lately been supplied in the form of cartridges, the formation of which permits a certain amount of pressure in their production, so that any excess of nitro-glycerine can be expelled, and the risk of explosion from the presence of free nitro-glycerine reduced to a minimum.

Mr Nobel imputes nearly all the calamities which have taken place from nitro-glycerine to leakage, it being almost impossible to prevent this, however perfect the cases are in which it is transported, the substance being so oily and penetrative, and he cites as an analogous case that of gunpowder being transported in cases dropping out or actually part of their contents. This probably has something to do with many of the terrible catastrophes which have had to be suffered from time to time, but we are inclined to think that many of them have also been produced by the careless handling of a substance the dangerous nature of which was at least in the first instance but imperfectly understood. In this as in many other things, experience had to be gained, though unfortunately at a terrible cost, and the very fact that few accidents have occurred in the process of its manufacture compared with those in its transport and use, bears us out in this opinion.

Mr Nobel, in a paper read before the British Association shortly after the introduction of dynamite, gave some very interesting information regarding both it and nitro-glycerine. We do not intend to review this paper, but we may be excused referring to several experiments publicly made with dynamite, to show that the opinion expressed in the paper of the comparative safety of dynamite as an explosive agent was fully justified. A box containing eight pounds of dynamite—equal to eighty pounds of gunpowder—was placed over a fire where it slowly burned away. Another box containing the same quantity was hurled from a height of more than sixty feet on a rock bulw, and no explosion ensued from the concussion. A still more severe test was that of dropping a weight of two hundred pounds from a height of twenty feet on a box of dynamite, smashing the box, and yet not exploding the dynamite. It is difficult to reconcile these experiments with the opinion popularly held regarding dynamite. We do not think we are exaggerating when we say that it is generally esteemed the embodiment of all that is dangerous and evil in such compounds. The truth lies probably midway between the two extremes. Dynamite it is certain will not always stand the extreme tests here stated, and in which we assume, it must be admitted, rather results frequently have happened in the process of handling and using. On the other hand, that it is not so readily exploded as is currently supposed may be granted, although we would hesitate to enforce this opinion, considering that public safety lies altogether in the former belief.

Both nitro-glycerine and dynamite are now extensively employed in mining, and other operations of a similar kind, and owing to certain peculiar characteristics which we have not as yet mentioned, they are well adapted for all such purposes. When nitro-glycerine in dynamite, or any other compound having nitro-glycerine for its base, is exploded, unlike gunpowder or the majority of other explosives, the effect of the

explosion is expended in the direction of those points in actual contact with the compound. Thus, if gunpowder was exploded on an iron plate in the open air, the disruptive effect would be nil, but if nitro glycerine or dynamite was exploded under the same circumstances, the effects would be the indenting or shattering of the iron plate downwards. In the same way, a gun fired with nitro glycerine would almost certainly burst, even though the quantity employed was not greater than that of an ordinary charge of gun powder.

It will thus be seen how valuable this characteristic of the nitro compounds is when applied to blasting operations, and it will also at once explain how the tedious process known to miners as 'tamping' is rendered unnecessary. Tamping is simply the filling up of the hole bored in the rock after the gunpowder has been introduced, so as to produce as much resistance as possible to the disruptive power of the gunpowder. The hole is filled with pieces of rock, sand, clay, and the like, and the whole is then rammed tightly together. In the case of nitro glycerine or dynamite, however, tamping is not necessary, simple contact with the bottom and sides of the bore hole being sufficient to produce the maximum disruptive effects. The mode of firing the compounds is exceedingly simple. They are introduced into the blast holes in suitable cases, and a fuse, having a small charge of gunpowder at its extremity, is fixed immediately on the top of the compound, and the concussion produced by the exploding gunpowder explodes the nitro compound. The ordinary fuse of the 'straw' used in some blasting operations would be unavailing in its results, owing to the non-explosibility of the compounds under the application of an open flame.

Government have wisely acted about regulations upon the manufacture, sale, storing, and transport of all the explosives named, as well as the numerous compounds which they are made to form when mixed with each other. Recent events may necessitate regulations even more stringent. No government regulations can, however, secure freedom from carelessness, and this forms one of the principal causes of the majority of accidents. It cannot be too widely known that friction or concussion is in all these compounds to be avoided, and that the great majority of explosives are rendered positively harmless if placed in water.

## ONE FALSE, BOTH FAIR.

OR, A HARD KNOCK

CHAPTER XI.—BLINDING LEGAL AID

'If you will do it, my dear, of course you will,' said Sir Pagan to his sister, two days after the dinner in Bruton Street. He spoke impatiently, and perhaps roughly, but his heart was not a hard one, and his mood changed at once as he heard a low stifled sob in response to his petulant retort.

'I will do it. It is my duty and my right, and at any cost, I mean to carry it out, was the slowly spoken answer of the golden haired girl, whose face was half averted from him. 'Right is right, brother, even though you, too, turn against me.'

'I'd have given a thousand pounds'—blurted

out Sir Pagan, and then stuck fast in his unimpaired speech, and blushed deeply red as he realised two facts—one the patent truth, that he had not a thousand pounds at his command, the other, that his lively words might sound unkind. 'I, for one, won't turn against you; I trust me, if I do!' said the baronet sturdily.

'And yet, Pagan, you never would really listen to me, never would be, as I had hoped you would, my champion and my friend, helping me—in you should—in the struggle, and!'

'Now, my dear, don't!' was Sir Pagan's almost piteous protest. 'Between you and—her!—he made a great effort here to suppress the word (Lure, that was trembling at his gates) speech—I'm not fit to be umpire. And yet, my girl, I mean to be kind, as a brother should. I'll speak to,' he added desperately, 'anybody if Lady Bubara—'

'Lady Pulari will never acknowledge my right, until the strong hand of the law coerces it,' exclaimed the girl, with a stifled flush in her pale cheek. 'You mean well, brother, but I see that I must save my own back through three or four lawyers.'

'But I am not a lawyer.'

'I shall go, then, in the first case to Mr. Pontifex, and I shall, also, in the second.'

'Why not, if you must go to a lawyer at all, go to my man, as I advised?' asked Sir Pagan, with some show of injury. 'What is not that?—I am a lawyer, I mean—and give a good deal for his services, or his thirteen or fourteen, in the full of costs, whereas Pontifex and I should be people I should no more go to, in trouble, than I should ask old Sir Joseph Doubleson, the Queen's physician, to feel my pulse. And what is so sharp? If you have a chance with a jury—I mean in those cases and that—he'll take you up, and return Damish or some such shrewd dog, and get you a verdict, likely as not. But if you haven't a leg to stand upon!'

'I am afraid, Pagan dear, I must manage my own matter in my own way,' was the mild, resolute reply, and Sir Pagan pulled out his watch.

'I'll tell James to have the brougham ready when you like to go out, O—sister,' blundered out the baronet, who had with difficulty enforced on himself the rule to call his newly admitted visitor by no name, thereby preserving his own attitude of judicial impartiality, and also in the hope of avoiding a scene.

It was not very likely that he would return until it should be time to dress for dinner—should it be worth his while to dress, for his backache meal—at his club or elsewhere. Few men get less of good or comfort out of the houses for which they pay, grudgingly, ground rent, rates, and taxes, and the bills of slaters and plumbers, than did Sir Pagan. But he had a dim consciousness that a baronet's house, like the sacrament of the proverbial Englishman, is his castle, and stands him in as good stead as does the shell of the crab to its crustaceous owner. Had he given it up, and gone to dwell in chambers, or St. James's Street lodgings, his credit would have gone down to County Court pitch, and the Society journals, so-called, would

have earned a pennyworth by scoffing at the fallen glories of the broken down House of Carew.

As it was, Sir Pagan departed, and an hour later, or less, Sir Pagan's shabby brocaded, with the Red Hand of Ulster lining, on its ill printed panels, conveyed Sir Pagan's sister to the chambers of Lincoln's Inn. She had the address of Messrs Pounce and Pontifex by heart, and entering the stony court, and passing under the low browed doorway, which frowned down upon her as it had frowned on many another petitioner—on none, surely, so loathly as she was—timidly mounted the black oaken stair, and ring the bell appertaining to the legal bar of those illustrious men of British, or at least English domestic law, of attainments, talents, wills, and remembrance, Messrs Pounce and Pontifex. A very civil, decent sort of clerk, bald as a billiard ball, came to respond to her summons.

'Is Mr Pontifex within, or Mr Pounce?' asked out the applicant for admission.

The clerk was an experienced clerk, and knew a lady when he saw one, but had Sir Pagan's sister been the poorest and most bewildered old woman who ever travelled by parliamentary train to London to prove her husband's will, good nature! Mr Jupper would have been patient and forbearing with her. 'Mr Pounce is not in chamber now, madam,' said the clerk, as indeed he might have said with perfect truth at most hours of every working day, for the visits of old Mr Pounce to Lincoln's Inn were so rare as those of angels. 'Mr Pontifex, I am afraid, is engaged, but—' What name madam, I mention?

'Lady Lomnetha. Mr Pontifex knows me. I am staying with my brother, Sir Pagan Carew, in Bruton Street, and I have come here this morning to consult Mr Pontifex on business.' Thus was said in the dull mechanical tone of one who repeats a lesson learned by heart, but of who the lesson is weary.

Worthily Jupper, the confidential clerk, screwed up his lips and arched his eyebrow, and then coughed. 'Clerks of the confidential variety are seldom slow in getting to learn the last intelligence as to the more important of their employers hereditary clients, and Mr Jupper had heard something, and guessed more, as to the singular circumstance between the well endowed widow of the deceased Marquis and her penniless sister. The mention of Bruton Street and of Sir Pagan's name made it plain to him which of the two it was who craved an audience with his principals.

'If—your Ladyship—would please to come in,' said Mr Jupper deferentially, after a moment's hesitation, and perhaps a titter, with the lawyer in the *birds of Lomnethamoor*, that nothing was lost by conceding a tith of courtesy. 'I will let Mr Pontifex know—This is the way,' added, pioneering the visitor through the clerk's office, where pens scribbled steadily over paper, and into a next dull antechamber, and then, after a minute's delay, into the presence of Mr Pontifex, who had risen from his seat at the writing table, and who came forward with an urbane bow to receive the newcomer.

The girl weakly took the armchair offered her, and thus came June around the room, with its shelves crammed with law books, and other shelves

that supported jammed deal boxes, gold lettered with the names of very distinguished clients indeed. The apartment itself was not ill furnished, with its thick old Turkey carpet and thick red curtains—but it had a gloomy look, and the light poured in in but a subdued fashion, even on that summer's day, through the beamed windows. Then she turned her blue eyes full on the lawyer's face as he sat opposite, watching her, with something of pity in his eye.

'You know me, Mr Pontifex, and my history,' she said, in a voice that had strangely lost its force, and that sounded almost harshly in the speaker's ear. 'who better, since you were at Castel Vaur when?—'

'When the unfortunate misunderstanding arose,' suggested the attorney smoothly, as he rubbed his hands together.

'Yes, rather, when the cruel wrong was done!' flung out the visitor with a sudden and passionate energy that made the lawyer wince. 'I have come here to-day to ask if you will help me. Will you?'

'Most willingly, if it be in my power—consistently, of course, with my engagements and my duty, was the guarded answer of Mr Pontifex. He was going to have to be guarded in his reply to such a one. A good man was the eminent family solicitor, and a good father. His daughter, at their luxurious Maida Hill villa, would have built on his tenacious notion that any possible pipe could be so good and kind and dear as was *their* pipe. And he had a very fatherly, sorrowful feeling towards this poor young thing, so beautiful and so misled. But there was some thing in her bearing, that chilled him. What must be—so he thought, in sorrow, not in anger—the heart of one who could pursue so steadily, so fiercely, it might be said, in a detestable course of self constituted importunity.

'I am not sure, sir, of the nature of your engagements, or of what your duty may consist,' was the hasty reply. 'Are you in the pay of my enemy?' And as he spoke, she hid rose from the great armchair, and her eyes glittered with angry excitement.

Mr Pontifex was speechless. Never, in the whole course of his professional career, had he been asked such a question. It took a woman to ask it. It took, after a woman, it may be said, an educated man, as more circumpect. But when a lady is driven out of her narrow conventional vocabulary of lady like pretences and plaudits, she is apt to say things that astonish conventional hearers. The experienced family solicitor gave a look which

'Of what enemy, my dear young lady, do you speak?' he said gently, when he had had time to reflect.

'Of her who dwells in my dead husband's house, who waxes his honours and his wealth, and thanks to whom I am an outcast, asperged by all,' was the wretched answer, and this time the girl sprung from her seat, lithe, flushed, almost fearful in her anger.

Nothing could have done her greater harm, in the judgment of so experienced a man of the world as coolly Lady Pontifex who had had to do, professionally, with bad nature as well as good once—who had been intrusted with the mission of coaxing rash Lady Maida, or obstinate Honourable

Flora, into giving up a re-improving correspondence with scampish suitors, and who had talked more than one doped lady into renunciation of 'that dim-dim necktie, which I know no more of it than the babe in the nursery,' sooner than prove police should be sent for, and horrid commitments ■■■■ mark out for the county jail. He was very much vexed now.

'We had better be calm,' he said, 'more cheerfully than he felt, "and indeed, in law matters—and you are in a lawyer's chambers, recollect—if we are not calm, we are sure to get into the wrong box. We, I mean, and Pontifex, have acted for the Marquis of Lecommer—I speak, of course, of successive holders of the title—for seventy years. We act now for the late lord's widow, for his executors, and for the Lady Barbara Montmorency, who is an old and a valued client, but of course we know nothing. You, young lady, are certainly not elevated in that category by us. And—here his tone changed to one of persuasion—"it would be one of the happiest days in my life if I could contrive to reconcile—"

'Never!' The word was hived out rather than spoken. 'I want my own—my rights. There is a law in England, let it do me justice. Then I could forgive her—not till then. I came ■■■■ you, sir, in hopes that you might aid me, but you will not. "Arist Vaur, Lecommer House, the great income—all are mine, and yet you will not defend me." Her voice sank almost into a wail here, and Mr Pontifex looked at her, as she hid her face between her gloved hands and bowed her fair head, with sincere compassion. All his previous knowledge was at fault here. He had no fiction line whereby to gauge the depths of a disposition so strange to his worldly lore. That her conduct merited, not sympathy, but punishment, he was certain. And yet it was pity of her. What evil influence could have warped from the path of common honesty a creature so lovely and so innocent! He had heard mention of that Madame de Laforce whose malignant counsels were deemed to have been the primary cause of the mischief. Mr Pontifex had himself no very good opinion of sterner counsellors of foreign birth and abominable habits. He shook his head as he remembered the little he had heard of Countess Louise.

'I am an old man—old enough to be your father, young lady,' said Mr Pontifex, 'not without a sort of dignity, such as earnestness and an honest purpose seldom fail to impart, "and I do assure you that it would be very pleasant to me to see your sister and yourself on friendly terms again, and that I do venture to advise you, as I would advise my own daughter, to give up the hopeless undertaking. I will not, as some lawyers would, set before you as a scarecrow the enormous cost and the tedious length of legal proceedings. Believe me, a long lawsuit is like a long war. It breaks the health, and spoils the nature, and ruins the hopes of many who are innocent of any active share in it. It is even worse for the principals. I know many a rich and tried gentleman who groans over the struggle that pride and prejudice, and the Englishman's stubborn resolve not to be beaten, have made him carry on, amidst denunciations and rebuke, changes of venue, notices of motion, papers

for new trials, appeals to superior courts, and eventually to the House of Lords. If I were you, my dear young friend, I would take an old man's advice, and accept once more the bright and becoming position in the world for which no one could be more qualified. Your sister's influence would—"

'My sister! I cannot listen with patience, Mr Pontifex, kindly as you mean, to such advice as you would force upon me. I have made up my mind, after much thought and much self-communing, and I am not to be turned aside by fear or by persuasion from my destined path in life. I gather from what you have said, Mr Pontifex, though you have been very good to me, that I must look for help elsewhere. I must seek it, then, where I can. Unhappily, ■■■■ know very little of London, and still less of the world,' said the visitor, as she rose to go.

There was a sort of civilian chivalry in Mr Pontifex that would not let her leave him thus. He, personally, could not help her. He had indeed the worst opinion of her cause, and he knew he was pledged to the Marchioness of Lecommer *de facto*, and to her imperious relative Lady Barbara, but he did not like ■■■■ see her depart solitary, sad, and scorned, like some dumb of the medieval times who could find no champion to break a lance for her in the lists.

'One moment,' said the lawyer. 'I will write a note to some colleague of ours, if I may say so, with whom we have frequent communication—one of the very highest repute—Messrs Hawk and Heronshaw, of Bank Court, Temple—able men and honourable men—I assure me,' and he pushed a few lines, sealed them in an envelope, and it and almost forced it into the little-gloved hand that took it so timidly.

'You think—' she said hesitatingly.

'I am sure,' resumed the lawyer, with perfect conviction, 'that if Messrs Hawk and Heronshaw can see their way to help you, they will do so. They are free in the way that hampers ourselves, and if they see the case as I most reluctantly am compelled to see it, you may perhaps be induced to—to think it over again before you decide scandal or any, which I, as an old well-wisher to the family, should be the first to deplore.—Mr Juppiter—'

Invited by Mr Juppiter, the visitor got away from the legal premises of Pontifex and Pontifex, and took to her carriage, which promptly conveyed her to the chambers of Messrs Hawk and Heronshaw.

## THE MAN WITH THE MONKEY

THE Man with the Monkey is not to be confounded with Man and the Ape. The one subject belongs to Mr Darwin and his antagonists, the other belongs to ourselves and to the British public—particularly to the public that congregates at art exhibitions and peeps down from nursery windows. Therefore, though Man and the Monkey is a large subject, we prefer to distinguish our own property jealously as the Man with the Monkey. He is commonly a man with dark hair, darkened wings, and a woe-begun smile—a metemorphic snail, that appears the moment you look anywhere within five yards of him. ■■■■ smile is accompanied by snarlings in Mediterranean French

or Italian, and both unite with the monkey in begging for coppers more plainly than plain English.

The man is a shabby individual. He wears a broad soft Savoyard hat, a velvet coat, with what Dickens used to call small tracks along the seams, corduroy contrivances, and dusky boots, the strongest of the strong. The organ strapped on his back gives him a stooping gait when he walks, and in cold weather, his partner in business travels snugly hidden inside the old velvet coat. It has been facetiously given as an illustration of Darwinism that the organ of the street musician develops to a large size when the player has to rely upon its use alone, and that when he uses something else as well in gaining his livelihood, the divined organ dwindles away. *Viva*, it is said, the musician with a monkey on his barrel organ and the musician without.

The music is certainly not the chief attraction in the case of our friend with the old velvet coat. The tunes are out of date and the mechanism wheezy. The very dulciana of the melodious whine gives the signal for the wamble to the nursery windows when 'a monkey organ is coming.' The chief attraction is the queer partner in the business, poor Jocko!—though he is by no means the sleeping partner. The characteristics of the monkey are his slumping, shabbiness, his injured air, and his beseeching look. How the slumping shabbiness is put together we are unable to say, it is as undecipherable in its way as a *Purvis* bonnet. We have come across the advertisement of a fashion book professing to give 'the latest fashions for children and pet dogs at Brighton,' but the 'fashions for monkeys' we have never heard of, nor found any hint as to their laws of dress or the whereabouts of their customers. Our impression of monkey costumes is a cocked hat, which makes the poor thing doubly unhappy till it is lost in the mud, a dirty old jacket, and a red shirt inclining to black, regulated in shape by the presence of two nimble brown legs and a tail that curls out from under it.

The monkey's injured air, combined with his beseeching looks, are as peculiar to his tribe as the pink pulsed hands, the pucker, or the evil tipped tail. The pottering dogs never hint at, nor has Toby, nor can the crows express it, when they are ready to tell the fortune of any lady or gentleman for a penny. The pair of boating clubs show the nearest approach to it in their natural manner, before they lay back their ears and rear up for another soft-paved encounter. The injured aspect of the monkey is shrinking and cowering, not indignant. He looks so cunning, that one can hardly pity him, but for all that, he is protesting that he is out of his place, that he feels ill at ease in the jacket of tinsel and scarlet, that area raiments make men chubbin' for him when he remembers his frocks in his native forest, holding on by the rope like escapees or by the tails of his brethren. All this he expresses with his eyes, which acquire a complaining and beseeching, if not an ill-tempered look. It may be his human ears of flesh—it may be the redness of his eyes, peering from under hair that makes an unmanly shaggy fringe of lashes—it may be the ugly-

ness of his nose and mouth, contrasted with his old man's air of thinking and observing—it may be the clanking mischievous restlessness of his hairy hands—it may be the inconvenient possession of a tail by a creature who wears a jacket—but somehow, as he sits up, chained to his master's organ, it has always struck us that the performing monkey has the air of an impish thing (unfamiliar to unsuitable service), and of a comical ill-favoured creature, quite aware that it is a marvel of ugliness in contrast with the humankind it is made to ape.

When Mr Mayhew was writing his book on *London Labour and London Poor*, he did not forget to interview and question one of the owners of performing monkeys. The man gave information freely in broken English and French, but somewhat lamely, as he had a frightened impression that in the streets of the town the monkey was 'defended' (meaning *defendu*, forbidden), and that his information might get him into trouble. He never did 'play de monkey' in town, he said, he went out 'vare dist' as so many donkey up a top at his village. He stated that performing monkeys were becoming scarce, there were not a dozen 'wet play in Anglitter,' for the reason that 'monkey is "defended" in the streets.' He himself was making about twelve shillings a week, sometimes three shillings a day, sometimes expense, sometimes nothing. He had had his monkey three months, having bought him for thirty five shillings.

'I did teach a him all he know. I teach a him vid de kindness, do you see. I must look rough for tree or four times, but not to beat him. I mu'nt feed him ten I am teaching him. Some times I buy a haphorth of nuts, to give him after he has done. What I want him to do.'

Then he alluded mournfully to this monkey's accomplished predecessor, who could use the sword, dance, and play the drum and the fiddle. 'Ah! but he don't play de fiddle like de Christian, you know, but like de monkey.' On this prodigy of a monkey he had lavished his care and attention, teaching him to walk with time and step regulated by jerks of the string, and rewarding him with 'baked ruses.' But just as the artifice was conquering the difficulties of the walk, he indulged in an imprudent meal of red paint, and, as the old crotchety say, 'physicians' wits in vain,' and he and his tricks came to an end.

Probably this man, like all his Italian fellow-travellers in London, looked inward to saving up a small sum even out of such scanty earnings and some day going back to Italy. It is true that there are other ambitions—to become a *pultrone*, sending out other men with his unmusical instruments hired by the day, or to open a small shop—one of the many dingy low-oiled shops with more dust than stock in trade, such as abound among the London Italian colony. But for the most part, the vendor and the macaroni maker, the exhibitor of a couple of guinea pigs, or of a monkey, and the dulciana organ grinder—all look to a future, when with a little money saved—very little will be sufficient—their departure from the land of foreigners and *faux* the land of sunshine, home language, and *dolci far wint*, and there buying a strip of ground and quietly doing nothing, help occasionally in the vintage or the harvest to replenish their purse. How men ever

accomplish this by selling ice at a penny each to the street children, is one of the mysteries of poor folk's economy; but it is certain that many of them do accomplish it, and triumphantly pack their goods in a bundle, and take ship for Italy with the wife of their bosom and the bambino. So this also, let us hope, is the destiny of the man with the monkey.

But he has rough uphill work while he is scraping his pence together. His board is meagre; the knife hidden in his belt is his protection against his associates; and he knows they have the same protection against him in the slightest difference of opinion, whether it be about earnings or about some suspicion of cheating in the game—the ancient classic game—of showing up fingers and counting them while they flash. As for his lodging, it is little better than that of his hawkeye partner in business. It is sure to be not far from Holborn, somewhere about Hatton Wall or old Saffron Hill. There, within a stone's throw of the spot where once were the strawberry gardens of the Bishop of Ely, lies the abode of the Italian colony, in many courts, circuitous lanes, and dismal little streets, widened here and there with traces of recent demolition of untenable overcrowded houses. Here, far later than the days of strawberry gardens near Holborn Hill, abounded not many years ago residences of such gentlemen as Fagin the Jew and his pupil the Artful Dodger; here were thieves' kitchens; streets impassable by night, and courts and alleys where human beings were pitiously crowded together, with crime and poverty and sickness as inevitable inmates to be shared. Those bad old times have passed. The neighbourhood has been thinned and improved, though not yet as transformed as it ought to be; and in the improved state of things, with enough of dismal courts and pent up lodgings, to form a dark background, the poor Italians of London have settled down.

The owner of the monkey belongs to that colony, as we guess from his costume, and from his Italian broken words, or his French of the north Italian frontier. He lives, perhaps, down one of those courts that are entered by a locked passage like a bottle-neck. He pays a pittance for his share in one of the houses that lodge a numberless community on each side of the long, narrow, flagged court. His share is a very small one. The basement cellars—rooms of these houses, down into which one may look through a grating near the steps, are odorous of greasy cookery and macaroni-making, and countless strings of macaroni hang drying on their wires above the tables and benches that form the only furniture. This is the kitchen, larder, and dining room, where the monkey swears the organ has rehearsed his tricks for a laughing good-tempered crowd, and where the man eats his nightly supper among his fellow-countrymen. Up stairs there are rooms, floor above floor, each furnished with an array of beds and nothing more, and our Italian, for his daily payment, gets his share of a couch with one or two more of his musical (?) brethren. The musical instruments and the animals are lodged together, either in a room apart or in a shed in the yard at the back. What a strange spectacle this shed must present! Piano-organs and barrel-organs, and all the amazing varieties of

hurdy-gurdy, are come to a dead stop there for a night's peace, like those 'happy families' that under certain conditions can agree in concord in a cage, though any two of their members have never agreed for five minutes elsewhere. There also dwells the monkey in private life, disburdened of the red jacket that held his arms as in a strait-waistcoat, and the skirt that interfered with the brandishing of his tail. There in their cage are the white mice; and perhaps the canaries that tell fortunes, the timid guinea-pigs of the Italian boy, and the noisy performing dogs, are lodged in the shed next door with the amiable assembly of barrel-organs belonging to another padrone.

There is another kind of little creature that is carried out with barrel-organs in London; its lot is thoughtfully made far worse than that of the monkeys, yet we know its nightly rest is not in the shed, but in the kitchen where the macaroni hangs, where the men smoke by the hearth, where the women gossip in Italian, taking off their flat linen head-dresses, and hugging their babes against skulls and short bodices bright as a rainbow. One subject of our anxiety is the organ baby. Who that walks through London streets has not seen it lying like an inanimate bundle upon the top of the organ, or a little older, crowing from the basket on the hand-cart ■ the end of the run hummel piano organ? Where are its limbs? Will it grow up deaf, or will it shout, haunted all life long by an atmosphere of noise? Has custom become a second nature ■ those that hear organs all day? Has the baby, strapped on the organ top, an inherited knack of not crying? Will it grow up to hear and understand and sleep like other children? Or will it grow up at all? We can conceive the monkey going mad, and tearing the organ and uttering the crowd, if he were condemned to lie with his head against it all day? But what can the baby do?

Why there should be a baby with an organ, is a query outside our subject, but we may ask why there should be a monkey? Some ignorant, ugly, awkward, cunning, trucksome likeness to humankind there is in this poor creature, that sits up with eager hands and listening, fleshy ears. The likeness, the running, and the freaks, are the reason of his servitude, and it is beyond doubt that he pleases the spectators up in the nursery, however much his presence may annoy the older spectators that put money in his hungry hand to have him taken away. Just in the same manner, though the mechanical barrel music may be the pest of one neighbourhood, there are others where it must not be banned, because it is a boon, and where, as the only music of the poor, it sets the girls whirling on the pavement, and the children dancing an infantile waltz-dance for glee. We believe, despite the complaints of men of nerve and brain, and despite laws enacted, the man with the organ has a firm foothold, because thousands of small households are enlivened by him—instead of being driven to depths of melancholy and despair, as more cultured ears may be. But the man with the monkey has not a firm foothold; he and the monkey are slipping away. He is following the long train of society that has played out its day. He is in the wake of the Maypoles and

the man with the dancing bear, and the trained monkey will follow the performing bear, first becoming, like brown, an astounding rarity, and then an extinct species. ■ ■ ■ found no more in civilized life.

## OUR NEW MANAGER

### IN FOUR CHAPTERS—CHAPTER II

THOUGH WITH excitement in the warehouse, the counting house, and the whole of the realms under the sway of Messrs. Mori, Keeley, & Co., for on the day following the incidents with which our last chapter closed, it was understood that the new partner—the capitalist—would enter upon the management. None of the clerks had seen him save old Mr. Scamler, the head clerk, who had met him ■ ■ ■ Mr. Mori: to give certain explanations as to the workings of the business, so the staff were all eager to catch the first glimpse of the new employer.

He was punctual, arriving exactly at the time indicated, but it so happened that Phil had gone round to the docks at the moment, so he did not see the triumphal procession—as one of his comrades called it—through the office. His curiosity, however, if he felt any, was not long unsatisfied, for through the speaking tube which led from the private rooms to the counting house, there came a message demanding Mr. Hartley to attend.

The young man, who had expected some such notice in connection with his visit to the docks, went promptly in, and found all three of the old firm present, with a strange gentleman, and old Mr. Scamler in attendance. "This is Mr. Philip Huttibly, one of the best of our young people," said Mr. Mori to the strange gentleman. Then addressing Phil, he continued: "As this will be the last time I shall be in this room, on business at any rate, Mr. Hartley, I feel great pleasure in introducing you to Mr. Pike, and telling him that he will find in you a valuable assistant."

At this, of course, Phil bowed to the strange gentleman, and would have said a few words himself, to the occasion, but that he had been utterly taken aback by what he saw immediately upon entering the room. The new partner, Mr. Pike, was the horseman who had held the 'angry parls' with the tannap on the previous evening, and who had been within an ace of forcing a quarrel upon Phil himself.

Mr. Pike, who raised his hat and bowed in return, met the eye of the young clerk for an instant in full, it was but for an instant, and the dark stern features of the stranger were so unmoved as so much marble, yet an ominous frowning possessed Phil, and he could not help fearing that he was recognised, as certainly ■ ■ ■ had recognised Mr. Pike. Yet there was a good deal to make this unlikely, for he had been on foot in the shade, and his voice had only once or twice been heard by the horseman; while the latter was far more conspicuous from being mounted and sitting in the direct line of the daylight, and from having spoken a good deal. Although Phil stole several glances at the new

partner during the interview, he could not detect the slightest approach to an expression ■ ■ ■ remembrance, nevertheless, he quitted the apartment with a very uncomfortable feeling, and a hearty regret that ■ ■ ■ should have stopped to listen to a round side quarrel on the previous evening.

Of course there was a great deal of talk in the counting house about the new master during the day, and the general opinion was that he would be a tight hand, a screw, a tartar, with diverse other uncomplimentary epithets all tending to the same description ■ ■ ■ character. A few days passed on, during which Phil saw or heard nothing to make him suppose that ■ ■ ■ had been recognised by Mr. Pike, so the ominous feeling referred to gradually faded, though it did not quite disappear.

The night for the concert arrived, and it need hardly be said that Phil was early in attendance at the Lower Down Road in order to convey Miss Marston and her sisters—for two younger members of the family were to assist in the choruses—to the schoolroom. In this concert was by no means a grand affair, being purely a local, even a parochial display. Not that it was of great importance to the 'struck' engaged, all of whom, including Miss Darnett, had been nervous and excited for some weeks preceding. Marston had tried very hard to persuade Mrs. Vethus to come and hear the music, but although that lady took a great interest in her young friends on earth, and was pleased to hear every little detail in connection with the concert, her selfish like habit could not be broken through, and she would not go in the picture.

The description of the concert may be compared in a few—it was highly successful. The band mouth of the band to fill nearly a column and a half with it, criticism—or rather eulogizing, without criticism—every singer and player in every effort, while the band mouth (hornets), having a quarrel with the sheet promoter of the concert was content to give exactly as and a half lines to the adur.

To the delight of Phil, the honours of the evening were unquestionably carried off by Miss Marston. Her good looks and attractive manner may have had something to do with this—too often it is so, but in any case, she was the star of the night. A less pleasant picture was the presence of Mr. Pike, who, to the surprise of Phil, entered with a group of the most influential patrons of the concert. He seemed to be greatly interested in the various items, taking a lead also in the applause which was so liberally awarded to Miss Darnett.

After the performance, the chairman who presided introduced Mr. Pike and another stranger to one or two of the principal artists—of course including Miss Darnett—mentioning at the same time that Mr. Pike was a gentleman who had just become a resident in his parish, and being an enthusiastic admirer of music, with a view to have an opportunity of saying how much he had been delighted by the admirable execution. Our readers can supply the remainder of the worthy pastor's language.

The compliments which Mr. Pike uttered so easily and fluently, confused Miss Darnett, who blushed, but did not look away the less pretty while doing so.

'Had I dreamed of hearing anything half so charming,' continued Mr Pike, 'I should certainly have come provided with the orthodox bouquet to throw to the princess down, but I must make up for the omission on a future occasion.'

More embarrassed than before, Maria at last retreated from her prominent position, and was then surprised to learn that the gentleman who had been so complimentary was no other than Philip's new chum!

Much conversation during the homeward walk was devoted to this incident, which had to be retold and speculated upon for the benefit of Mr and Mrs Darnett, the good body, who presided herself upon her feminine powers, expressing her belief that a better thing for Philip and Maria could not have occurred. 'And mark my words,' concluded the good lady, 'you will both often look back to this night—very often now, remember what I say.'

Philip tried to feel the same confidence in this fortunate omen, but was a truly successful Puritan; it was the unpleasant character of his introduction to Mr Pike which influenced him, but he felt an invincible dislike to that gentleman, a dislike which was almost akin to dread. He disliked his voice, his face, his whiskers, and above all, his eyes. Yet he tried to share Mrs Darnett's sanguine views of the future, in which her daughter at any rate was an exception, believe us.

Some days passed without any incident of great note. The staff of Messrs More, Kelly, & Co felt even thus early that the anticipation which had heralded the approach of Mr Pike were likely to be fully realised, and that the business would receive an impetus from his coming such as it never before had felt. There was an immediate and ceaseless activity in every department, and rumour was rife of huge contracts being undertaken in quarters hitherto quite outside their sphere of operation.

Among others who were affected by the energy of the new partner was Mr Darnett, who was invited by letter to call at the office on a certain morning, and he did so, although with some hesitation and doubt as to what his visit might result in, for Mr Darnett was 'on the books' of the firm to an extent which, although small to them, was serious to himself, and owing to the unfortunate issue of one or two pieces of business he had lately undertaken, he had not preserved that regularity in his payments which is expected in mercantile transactions. So he was filled with depressing anticipations, which, however, were all agreeably dispelled.

His interview was with Mr Pike alone, and he found the new manager to be quick, decided, imperative indeed, in his manner, and the first half dozen sentences he uttered showed Mr Darnett that he was thoroughly acquainted with all the bearings of that customer's account. This did not appear like a favourable commencement, but, to the surprise and delight of Mr Darnett, the conversation took an unlooked-for turn, and Mr Pike pointed out how much better it would be if he made more extensive purchases and went in for larger operations. Not only would he buy cheaper, but such petty losses as he had lately met with—Darnett winced as

the other accurately catalogued these—would only affect the percentage of profit, not, as now, determine success or failure.

Mr Darnett began, rather stammeringly, to explain that he should much prefer to do thus, but—

'But, you mean to say,' interrupted Mr Pike, 'that this requires either capital or credit? Of course it does, and as More, Kelly, & Co intend to throw off the sleepy old-fashioned way in which their business has hitherto been conducted, I can offer you, on our best terms, all the credit you are likely to require. So, let us see how you can go to work, Mr Darnett, and you shall not find our house backward in aiding you.'

There was of course a little more conversation of this sort, but to the same effect, and Darnett went home dejected to the seventh heaven of delight, and filled with visions of such a surly and so an elderly struggling man as business would be likely to picture.

This delight was certainly reflected and heightened in the minds of his wife and eldest daughter, and when the hour of the house had driven out to visit a village where he believed some business was to be done—he was a lumber dealer, whose chief connection was among small builders—mother and daughter sat down to some needle work in the front parlour, in order to have a long and undisturbed chat over the great announcement of the day. Naturally, much of what they said was in praise of the new partner, his generosity, his delightful manner, how fortunate it was that he had come into the firm, and what an excellent thing it would be for Philip.

In this way the theme was continued and learned, until Maria, chancing to look up, uttered an exclamation which attracted her mother's attention, and on looking up in turn, Mrs Darnett also uttered an exclamation for there was Mr Pike himself in the act of dismounting on his horse at the garden gate, he being in his hand a most lovely bouquet, the very sight of which at once coloured Maria's cheeks and brow with the blindest ecstacy, and caused a meaning look to pass between her mother and herself.

The expected knock was heard, the servant—'How lucky that Betty has got her afternoon frock on,' whispered Mrs Darnett, who shut her door to think in what a dress their only servant might have confronted the magnate—the servant, we say, announced Mr Pike, and that gentleman entered. He had taken a seat, apologised for his intrusion, and put Mrs Darnett entirely at her ease within one minute of his entrance.

'I dare say,' he continued, 'that Mrs Darnett has considered me, ever since the night of the concert, as the most faithful of mortals—I, it not so?'

'I—I did not—I am sure,' faltered out Miss Maria, quite confused by this sudden appeal, 'I never—'

'Why? Did I not promise to make up for my remissness in not coming provided with a bouquet?' said he. 'Well, here is the best I could get, for having to wake up the seven sleepers, or rather six, in our doorway place, and having to be in a dozen different departments at once, all day long, I really have not had time to be about so small, yet so essential a matter until to-day.' So saying, he handed to Maria

the 'lovely bouquet' already admired. The quick eyes of both his listeners saw that it was clasped by an elegant silver holder.

After one or two exclamations of surprise and pleasure from both, Marian murmured to say: 'But this is far too beautiful to be—used—costly for me.' Only great singers ought to have such offerings, Mr Pike. I ought to return it, I am sure.'

'Well, if you think it too much as a gift, the only thing left is for you to purchase it, Mrs. Darnett,' continued the visitor, 'and that can be done at once, by your singing me another song. I had not sufficient courage to ask such a thing at first, but I confess that I took advantage of my first hour here to ride over in the hope of hearing one.'

This was more overpowering still, yet it was impossible to refuse anything to so potent and generous a person, so Marian sang, nervously at first, Mr Pike offering to do his best as accompanist. His best appeared to be about as good as it was possible to be, for he was a master of the instrument, and then he showed that he was an admirable singer. In a splendid baritone voice he gave songs from the operas of which Marian had only read, so delighting her, that when she owned she had never heard in opera, he declared that it was cruelty to allow her to be pleased with such a pitiful imitation, and that he would see that Mrs. Darnett had tickets sent her every night during the approaching visit to Sandhurst with a great opera troop. After this promise, he departed, leaving Mrs. Darnett an invitation to partake of a cup of tea—which refusal that lady, hospitable as the rule was, was secretly rejoiced, disavowing her resources upon so short a notice—and leaving his mother and his daughter bewildered and delighted beyond all precedent.

This pleasing statement had not subsided in the mind Phil paid his customary evening visit, when all particulars had to be referred to him, and all sorts of variations rung in praise of the new primer. Phil was much astonished at hearing all this.

'He does not seem that sort of man to me,' was his comment. 'I cannot say that he has done anything at all harsh or out of the way in the warehouse, yet I am quite sure that is not a man in the place who likes him now, or who does not feel afraid of him.'

'Well, Phil, dear, you at any rate will never have cause to feel afraid of him,' said Marian, logically following up her impressions, 'for if he takes such interest in my father, and shows such kindness to my mother and myself, he will be sure to think I get a deal more of you, who are such a help to him. I should not wonder if he made you head clerk, when old Mr. Scamler retires.'

Phil shook his head, as though he were indeed under this summary, and then, after a moment's hesitation said: 'I never told you, Marian, of a quarrel which I saw one evening between a gentleman and a tramp, and in which, indeed, I may almost say I took a part.'

'No, of course you never did!' said the young lady. 'What was it, Phil?'

In reply, Mr. Hartley gave a detailed account of the adventure, in which Marian was greatly

interested, and when she heard of the identification of Mr. Pike with the horseman, her look changed to a very serious one.

'I hope he does not remember you, Phil!' she exclaimed. 'I should not think he did—should you?'

'I should not think so,' returned Philip casually, 'only, that whatever ought not to happen, and whatever you don't want it to happen, is exactly what always does happen. Yet I must own that he has never dropped a word which could lead me to think he recollects me, and but for something in his eyes when I first met him—in the other, I mean—I should feel pretty certain that he had forgotten me. But only think, Marian!—I saw that very tramp to-night, as I was coming home.'

'I hope he will not get into any more quarrels, and not let you,' said Marian. 'Why did he not go away somewhere else? He ought to do so, you know, if he is a tramp.'

'I think it is because he does not know where else to go,' replied Phil, with a laugh. 'I saw him at the circus, when he has recently come to Sandhurst, and which is likely to stay there a long time, I hear. I did not know him, I merely saw there was a shabby man, who was leaning against the woodwork by the side of the building and smoking a pipe. But as I passed, the man nodded to me. "Hi! you are well, sir?" Of course I nodded closer to him than, and recollected where I had seen him. He told me that he had got work at the circus. I was not particularly glad to hear that, for I have a kind of instinct which makes me wish him quite out of my way to my surprise, he asked me how I liked my new "governance," saying that he knew who Mr. Pike was, and then I remembered some old words he had used on the night of the quarrel, which I put no attention to at the time, but which I now see had the same meaning. I laughed, and advised him to keep out of Mr. Pike's way. He laughed too, but in a very unpleasant style, and said: "You bet I shall. I have been doing it in a good while, and it will be just as well for him to keep out of mine."

'What could he mean by his strange language about Mr. Pike?' said Marian, going straight to the point which had impressed her most. 'Do you think he can be mad? Ought we not to tell Mr. Pike about him?'

'No, I do not think he is mad in the least,' replied Hartley, 'and from what little I have seen of Mr. Pike, I doubt if that gentleman would approve of my meddling in repeating such a conversation. But we will not talk of my friend the tramp any longer.—What do you think I heard to-day, Marian?'

To this query Mrs. Darnett was obliged to return a reply declaring that she could not guess, and Phil then told her that a rumour of Mr. Scamler's speedy retirement was rife in the office, and, as a matter of course, speculating as to the changes consequent thereon were made. As these speculations included the position of Mr. Philip Hartley, and as his promotion involved a larger salary, and as a larger salary would justify his immediate marriage, it will at once be seen that the fresh line of conversation suggested was sufficiently engaging in its interest to banish all recollection of minor subjects, and

to supply an ample stock of materials for castle building, with visions of furyful in general, for the remainder of the walk, on which, according to custom, they now started.

## THE MOON'S ROTATION

BY PROFESSOR HENRY WATTS, ASTRONOMER ROYAL FOR SCOTLAND

Of all the permanent heavenly orbs, there is none that is so near us, is seen under so large an angle—or, if you prefer it, of so large an apparent size—and is at the same time so gently illuminated as to permit men to gaze at it uninterruptedly, and is so abundantly marked with diverse figures of brighter and darker parts all over its surface, as the Moon.

The well known changes in general form of the luminous part of the disc or sphere, known as the phases of the moon, arising from the different manner in which it is illuminated by the sun in the course of the month is seen by us on the earth, and revolving in the popular names of New Moon, First Quarter, Full Moon, Third Quarter, and New Moon again—highly interfere with the regular observations of the minute markings and details of the surface above alluded to. But the phœbe effects are easily allowed for, and thus there comes out this conclusion, or statement, in which all observers both past and present agree—namely, that the moon always turns the same face of itself towards the earth, during the whole time of every monthly revolution she makes around it.\* Hence also comes the equally undisputed fact, that mankind is acquainted with only one side of the moon, and never will, in the ordinary course of nature, know what markings or features, any of sea or land, plains or mountains, there may be on the other side.

How this effect comes about, and by what physical means it is kept up, not only throughout the revolution of a single lunar month, but for tens of thousands of such periods, is fact the whole out all history—is an interesting branch in the physical astronomy of modern times, but not for us to enter into now, for we have a preliminary question given to us as our present task—namely, with regard to the general and indisputably observed fact above alluded to and which question may be formulated thus: What are we to say or believe as to 'the rotation of the moon,' after having ascertained that it keeps one face steadily towards the earth, during the whole of a monthly revolution around it?

The answer ought not to be difficult, and indeed so early an authority as Democritus, a Chaldean astronomer in the fourth century before

Christ, is recorded to have come to the true judgment; for he announced that the moon rotates once on its axis in the same time that it revolves once round the earth, and that opinion has been held by every practical astronomer, mathematician, and naturalist since the time at least of Francis Bacon.

But these three titles, or professions, by no means include all men, even of education, for some are occasionally violent on the other side. 'It is curious,' said one of our latest and most brilliant of mathematical philosophers, Clerk Maxwell, 'to see how speculators are led by their neglect of the exact sciences, to put themselves in opposition to them, when they have not the slightest point of contact with their system.' And it has always been so. Whenever we find that in the sixth century A.D. a logician named Simplicius must needs come out to oppose Ptolemy and the astronomers by declaring that the observed fact of the moon always keeping the same face to the earth during a revolution around it, showed that it, the moon, did not rotate on an axis at all.

Now, if Simplicius had meant that he was only speaking with regard to what may be termed 'apparent astronomy,' he would have been excusable enough, so far as that mere temporary stepping stone of apparatus, in place of real and absolute astronomy as concerned. But, unhappily, he did not mean that. He wished, on the contrary, to expose what he believed to be an outrageous blunder of the astronomers at the very beginning of their own science, and to have the honour himself of turning the world his own discovery, by a true interpretation of the observed and actual facts of observation, that the moon in space does not rotate, or turn on an axis at all.

It is strange, with the astronomer Arago, in the beginning of the century, that this cause of men cannot see, that if the moon did not turn on its axis, and did keep one part of its face always pointed to one particular direction in space, that we, on the earth, would then necessarily behold one side of the moon in one half of its monthly revolution round the earth, and the other side of the moon, through the remaining half. But this class of men who cannot still, are obstinate in not seeing or understanding the case in this way, and hence they rush into the open to declare astronomers mad.

Thus, at the Bath meeting of the British Association for the Advancement of Science there was quite a noisy and abusive usurpation of the men, pronouncing that the idea of the moon rotating on an axis, when it always presented the same face to the earth, was fully. Although, too, they were admirably inverted than by the learned Master of Trinity, Dr Whewell, they came out a, an moon after at the Royal Astronomical Society in London. One of the party, too, pronounced there an absurd child's toy, hoping to make his opponents look ridiculous. For he had them set up a doll dressed as a military general in the centre, and put a figure of a soldier, with his face to the general, on the end of a lith revolving around that centre, when, of course, the soldier kept his face obediently towards his chief during the whole of a revolution around him. And then said party showed that the

\* In an article, 'Is the Sun Wobbling?' in a recent number of this Journal (No. 933), the words were used that the moon does not rotate is wrong at from the fact that it always presents the same face to the earth. This has led to some misapprehension which we all have been avoided had we said, 'that the moon does not apparently rotate,' &c.

soldier having been firmly fixed by two nails to the lathe, could not possibly have turned on an axis at all. 'No, not with regard to the lathe,' said a Cambridge man; 'but as you continue to revolve him by means of the lathe, he rotates round my finger; as he held that down over the little soldier's head from above and from outside all the doll machinery; or as from a region representing infinite space, where directions, as of the cardinal points, are everything.

In other words, if one celestial body revolves round another, keeping the same face always to it, the former must change its face at the same time with respect to circumambient outside space; and in such space, which is astronomical space, a body rotates on an axis, when it changes its surface directions continually towards any fixed point in such outside and instantly removed circumference; equally, too, whether the said body, be in general movement through space or not, that is, revolving round another, or not. Whence we may draw the happy final conclusion for the rising and learning generation, that all the known text-books on astronomy by astronomers in every country are perfectly correct when they state, in spite of logicians of the school of Sumpston, that the moon rotates on its axis once in each of its revolutions round the earth.

## HOW PIRATE GOW WAS CAPTURED.

A STORY TOLD MANY YEARS AGO.

Yr<sup>s</sup>, sir; I am, as you say, of a good old age—nearly two come August, and hale and hearty for my years. I've gone through a deal of tear and wear in my time, sir, served my king and country by land and sea under the immortal Nelson, and remember Trafalgar as though it were yesterday—Do I come of a long-lived race? Well, father he was drowned when a young man, but grandfather lived to be ninety-eight—Did grandfather know anything about Gow the Pirate? That he did; wasn't he servant to Mr James Fen of Eday, who captured the buccaneer? I wish I had a crown for every time old grand-dad told me the story of the capture—Will I tell you the story? Gladly, your honour; but if you'll allow me, I've got the whole account as written by grandfather himself; here it is, and you can read it for yourself.

I was born in 1703, in a little cottage in the island of Eday, in the Orkneys. We were fisher-folk, my father being a tenant of Mr Fen, who owned part of the island. The young land—Mr James, we called him—was fond of fishing; and when living at Carrick House—his father's residence in Eday—used often to go out in the boat with father and me. I dearly loved Mr James. He was a gentleman every inch of him; open-handed and handsome, brave as a lion, with the sunniest smile you ever saw. Such was the young master ere his troubles came upon him. It was a proud day for me when he asked if I should care to be his servant. Of course I owed. I remember telling him I would willingly follow

him to the world's end. He laughed in his pleasant way, remarking that at present all he required of me was to follow him to Carrick House. Those were happy days. I loved my master dearly, and small blame to me, for he paid liberally, and, what I valued far more, talked to me sometimes as though I were a friend, rather than a servant.

The master liked society, and usually spent the winter months in Kirkwall and Stromness, often riding from one town to the other, fair weather or foul, when a ball was about, and back again next day to another dance at the place he had left. In each of these places Mr James had rooms of his own, and a spare wardrobe.

Mr James had never been in love—seriously, I mean, though of course he had had his passing fancies, like most young gentlemen. But the time drew near when he was to know what real love meant. It was the Yule of 1724; and my master had been invited to a ball at Stromness, given by a gentleman whose daughter had just returned from France. You see, the young ladies of those days were educated in French convents, and were sent home with quite grand airs.

I remember Mr James remarking, as we rode together through the blinding snow, scarce able to keep the track, so dark was the afternoon—'Nul,' says he, with a laugh, 'there's a saying, the Mounseers are half-monkey half-tiger; but I hope they have made Miss Hilda neither the one nor the other. She was such a dear little thing before she crossed the Channel!'

I said I believed Miss Hilda was far too sweet a young lady to be spoiled by the Mounseers. The master laughed, clapped spurs to his horse; and away we went, dashing past farmhouses where the good folks held high festival; until presently we were clattering through the streets of Stromness, and had pulled up at the little hostelry.

I don't think Mr James ever showed to greater advantage than he did that evening, entering the ballroom with the air of a lord. He looked so noble, his eyes the colour of the blue ribbon containing the golden love locks which strayed over his velvet coat, on the breast of which bloomed the white rose, emblem of the exiled king. With sword on thigh and head uncovered, he walked to the end of the room to greet the host and hostess, and renew his acquaintance with Miss Hilda. From the door where I had posted myself I could see the master's every movement—how, when his glance rested on the young lady, he started, blushed, and then such a light came into his eyes, as made me feel a sort of pain in the heart, which I believe was a foreboding of the evil days to come. The next thing I saw was my young master leading out Miss Hilda to the minuet. Quite a buzz of admiration arose as they paced through the courtly dance; she, fair as a lily, dainty and sweet; he, grand and handsome, like the sea-kings whose blood flowed in his veins.

Mr James had intended returning to Kirkwall the day after the ball; but he lingered for many weeks in Stromness; and wherever Miss Hilda

went, there my master was sure to be, they had so much in common—beauty, youth, and health, besides an ardent attachment to the *Savaris*, for the lady also wore the white robe.

Time passed, and my master's passion for this lovely young lady continued to increase. But though she liked his society and accepted his homage, she did not altogether return his love. Mr James was blind, he could not see that the love was mostly all on his side, yet he sunk from putting his fate to the test—All this I gathered from my dear master's behaviour.

One day there came a letter from his lawyer, begging him to ride off once to Kirkwall to settle some business matters. He stood twisting the letter about in his hands, and I heard him mutter, 'I will not do that until no longer.' Then observing me, 'Ha, No! but, are you there? Try a case of mount and ride, so bring the horses to the door within the hour,' and as he spoke, he shook from the room, and I saw him pass down the street in the direction of Mrs Hilda's house.

I was with a heavy heart that I killed the horses and brought them round, for I expected to see Mr James returning, the picture of day and night, in a few minutes he returned all smiles, joked me about my lugubrious face, sprang into the saddle, and entered gaily down the street. I followed, wondering what had wrought this sudden change in his behaviour, but the mystery was solved when I saw Mrs Hilda at her window waving her hand to my glibest master, who doffed his hat to the lady with such a glad light in his eyes as I had not seen for many a day.

So we fired merrily at Kirkwall, Mr James singing a gay Scotch song. Presently, he laughed, and said, 'Well, Sir Knight of the Banful Countenance, how goes it with you now? Ah, I'm pleased to see a smile on your grim visage, the riddle that I have perplexed many for you. I'm the happiest man in Orkney, Neil! Mrs Hilda has permitted to be my wife. I am not worthy of her, but, please God, I shall try my best to become a better man.' And as if thinking on the past and the future, he fell into a reverie, which lasted till we rode into Kirkwall town.

'Happy is the woman that can long endure,' so runs the proverb, and had the matter had his way, Mrs Hilda would have been the young mistress of Carrik House before me. But she always put off the wedding on various pretexts.

In the autumn, my master was obliged to go to Caithness on business, and I, in usual manner, joined him. We were only about a fortnight, but on our return to Stromness found great changes had taken place in the interval. The war ship *Ramage* lay in the harbour, her crew paraded the streets or thronged the taverns, and Mr James found Mrs Hilda surrounded by a group of officers, conspicuous among whom was the commander of the *Ramage*, Captain Gow.

But you searched the world over, you could not have found a greater contrast in my master than the captain. The former was fair, with a countenance open as the day, the latter, dark, black bearded, and swarthy. He was indeed

handsome after a fashion, and always dressed richly, usually wearing a crimson velvet coat lined with gold, and the finest ruffles. But there was something uncanny about the man, he always appeared to be acting a part. Probably, Mr James felt this, for he gave him but a curt welcome when introduced by Mrs Hilda. (It was the fashion at this time to rave about the handsome commander of the *Ramage*—my master had deemed him his friendship.) And Mrs Hilda! She seemed gladdened by the bold sea rover, yet she was kind as ever to his betrothed. He could not shut his eyes, however, to the fact of her evident preferences for Captain Gow, with whom he would have picked a quarrel, had not the lady, divining the thought, made him promise to keep the peace for her dear sake.

I knew Mr James was taking his leave to devise some plan to get rid of Gow, and as occurred to me I might help him. Hitherto, I had kept aloof from the crew of the *Ramage*, but now I resolved to mix with them, and try if—when the drink was in and the wit out—I could not hear something which might serve my master, for I hardly believed Captain Gow's statement that he was first captain in His Majesty's navy. My investigations were successful. I learned from one of the crew, in a fit of drunken confidence that his commander was what he called a *Black Prince*, a sort of villain.

I made haste to impart this information to my master, who exclaimed, 'Ah! a felon, is he?' adding, 'But he shall not be condemned with out evidence. I shall write to a friend in London, and ask if Gow's name appears in the Navy List.'

The letter was despatched, and in the meantime Mr James bore as well as he could the various openly expressed suspicions for his betrothed.

My master received an answer to his letter in due course. No such name as Gow, with his corresponding appearance in the Navy List, but all Europe was ringing with tales of the atrocious perpetration on the high seas by one John Gow, a pirate commanding a ship called the *Queen*.

Mr James was greatly excited after reading the letter. He peered the floor hurriedly, and perceiving remarking that the room was clear, sat he up his hat and quitted the house. After leaving the inn, he hurried to the Lookout, in command about half a mile from Stromness, where he came unexpectedly upon Mrs Hilda and Gow. The lady's hand was clasped by the pirate, who whispered words of love into the willing ear of his companion, bending to the quick, my master caught at the opportunity, poured a torrent of reproaches on the head of the faithless lady, and in no measured terms informed her of the character and crimes of the man she had admitted to such intimacy.

Mrs Hilda refused to credit the statement, upbraiding him for defaming the name of a better man than himself. Mr James dared the pirate to deny the accusation, but Gow only laughed mockingly. He did not consider it necessary to vindicate his honour to a jealous love-sick boy, he said. Mocked by the trait, my master drew his rapier, calling upon the pirate to defend himself, which he was not slow to do. They exchanged sword-blow, but Mrs Hilda intervened, commanding them to forbear. She spoke

\* For another episode in the career of Gow, see *Chambers's Journal*, 980.

executioner I covered my face with my hands, for my nerves gave way, and I never looked up till I heard the crowd dispersing.

Two days after the execution, as I wandered along the strand, a closely veiled lady approached, put a letter into my hand, and before I could speak, disappeared among the crowd. I recognised her even in her disguise, it was poor Miss Hilda. The letter was addressed to Mr James. Later, I learned how the poor lady had come to London, hoping to see her lover. She was too late, he had been executed the day before her arrival. I and I left a letter in which he begged her to pray for the repose of his soul, and that, in compliance with his last wish, she proceeded to France, where she entered a convent and took the veil. Whether such was her fate, I know not, for from the time I saw her in the Strand, she disappeared utterly, and I could never learn any tidings of her.

I blame Miss Hilda's letter for a very serious illness contracted by Mr James at this time. He fell ill very soon after reading it, and in his delirium raved about her cruelty in calling him a murderer. I suppose the poor lady, distressed at the dreadful fate of her lover, and consequently seeing things in a distorted light, had secured my services of being his destroyer.

I was glad when Mr James recovered sufficiently to return to Orkney. His native heath-lands restored him strength, but he never entirely recovered his spirits. Misfortune dogged his footsteps—but harvests and interminable lawsuits wrecked his patrimony, and made an old man of him before his time. After some years, he married a sweet, gentle, little lady, who worshipped him, children were born to them, and had it not been for pecuniary anxieties, his life would have been a very happy one.

My story is nearly done. Mr James was out in the 'Forty-five,' and I shared with him the glories of the campaign, ay, and the defeat too. I weep when I think of Culloden, and the gallant young Prince wandering homeless and unfed, hunted like a wild beast in the land of his forefathers.

I lived to see my dear master laid in the grave, and his estates pass into the hands of strangers. Then I went to Portsmouth, to live with my boy Charlie, for Orkney was never the same to me after Mr James was gone.

Will, your honour, you've got through a tough yarn. You see my grandfather was a bit of a scholar, read plays and such like, and he picked his words more like a gentleman than a common man. I often heard him tell it by word of mouth, and he never mixed but with tears in his eyes, for my grandfather was as tender as he was true.

#### STRAW AS FUEL.

In Russia, Wallachia, and many other districts, straw is so abundant, even being so largely grown, that it is a perfect drug in the market, and has to be burnt in large stacks, merely to get rid of it. There are now engines made, more particularly the portable steam-engines used largely for farming purposes, which are so arranged that straw can be used as fuel for generating steam,

without the employment of either wood or coal. The arrangement that is found most favourable is the engine on Haul and Schenck's patent—constructed by Messrs Ramsomes, Haul, and Jeffries, Ipswich—in which the straw is automatically fed into the furnace by means of toothed rollers, very similar in action to a chaff cutting machine. To enable our readers further understand the advantages of such an invention, we should add that in addition to straw, almost every other description of vegetable refuse may be burnt, for instance, cotton and maize stalks, corn, jungle grass, &c., and by simply removing the piston feeding apparatus, the furnace can also be fired with coal and wood in the ordinary manner. It is hardly necessary to point out that by means of this invention, steam power can now be introduced into distant countries, which, on account of the absence of coal or other suitable fuel, have been hitherto debarred from its many advantages.

Nothing which might give my naturally believed Captain Gow's story a postscript in his Majesty's magazines was successful. I had the crew, in a fit of drunkenness, his commander was what he called a sort of a fishwife. I was to report this information to the commandant. 'Ah! a fellow, but he shall not be continued with I shall write to the friend in Lord Gow's name appears in the 1

for was described, and in the mean time as well as he could the crew's dissatisfaction for his behalf I first received an answer to his letter.

No such name as Gow, at least, appeared in the Navy List. I was in, with tales of the story on the high seas by one John C. mentioning a ship called the *Albatross* was greatly agitated after it.

He passed the floor humanely, remarking that the room was up his hat and quitted the house. In the inn, he hurried to the look-out about half a mile from Strimmon, unexpectedly upon Mrs. Hilda and her hand was clapped by the priest, his words of fire into the willow, his power being to the quick, my mind the lovers, poured a torrent of on the head of the faithful Lily, mounted tears informed her of the calling of the man she had admitted into my.

Hilda refused to credit the statement, but Mr James had to deny the accusation, but Gow's mocking. He did not consider to vindicate his honour to a jealous lover, he had. Maddened by the insult, he drew his rapier, calling upon the priest.

## PHILOMEL

It is late on a fine night in early May I am alone. Yet why should I say so, when for me at least there is no loneliness? Various books strew the table, others look down on me from the shelves, ready at any moment to hold sweet converse with me. From the walls, the semblance of the Venus de Milo is smiling on me, and that view of Lough Lisk in far away Donegal speaks to me of long vanished days. I throw open the window to enjoy for a few minutes the fresh and perfumed air, and look out on the starry sky. When, hark!—what is that 'long entrancing note' that breaks on the stillness? It stops. Again, what a tempestuous burst of melody! Another brief pause, and then, those low, sweet notes, long drawn and sad, in a few moments breaking once more into loud song, in which the tones of challenge, mockery, defiance, mingle with 'pity pleading strains'—the whole marked from time to time with such a vehemence of utterance as to suggest the workings of an imagination whose creations are so rapid that hardly even the fitfulured postman's wonderful organ of expression can keep pace with them. It is the song of the nightingale—the Philomel of the poets—and as I listen, Keats's lines come to mind:

Now more than ever seems it rich to die,  
To cease upon the midnight with no pain,  
While thou art pouring forth thy soul abroad  
In such an ecstasy!

Six weeks had passed, and once more, on one that May evening, I opened the window for a last look out before going to rest. The sky, as before, was brilliant with stars, the soft air of a June midnight breathed its sweetness on me, but the song of the nightingale—that song which so lately had heightened the charm of the forenoon, and filled the darkness with its melody—where was it? Even already with the past! Thus early some of the charm of summer had departed, and the song and the season had alike become the emblems of life's vicissitudes.

Verisimilitude! The word summarises half of all the unthought-of born of the conditions under which we find ourselves in the world. In the course of the seasons alone, as they wax and wane—as the flowers brighten and fade, as the sun breaks into song and relapses into silence—this transience is set for ever before our eyes. Hardly has winter melted in the embraces of spring, than the young verdure of the latter season is overwhelmed in the voluptuous foliage of summer, and hardly have we rejoiced in the developed exuberance of summer, than its ardent sun begins to mark it with the tawings of decay. So, too, in the world of mortal life, more vividly in bud than elsewhere, all continually tend to the same silent law, the unfurlingness with which vastitude twines itself round and makes its own of all things so soon as they come into existence or commence their course. The cessation of the nightingale's song is one of the earliest signs that the summer is already on the wane. Other generations than ours, and with as varying sensations, have listened to that song.

Perhaps the self-same song, that found a path  
Through the sad heart of Ruth, when, sick for home,  
She stood in tears amid the alien corn.

These generations, moreover, may have discussed, as we still do, whether that song is to be considered melancholy or glad, each section of debaters finding the data of their respective conclusions not in the song itself alone, but in the varying temperaments and as varying imaginative capacities of themselves while listening to it.

Some men are grave of mood, others gay, some highly sensitive, others hardly so at all. To some, the wondrous creation of their own imagination are half, or far more than half, of the world they live and move in. To others, imagination yields little or nothing at all, and these plod on their unvarying way through the mazes of dullness. Some men are, for the time being lifted by music into a world in which earth has no part, while for other men, that world of mine and evoked joy has no existence

Moreover, between each of these extremes there are countless gradations. In short, as regards variety of temperament and imaginative capacity, men may be compared to the strings of an instrument, any one of which vibrates if its own note be struck on another instrument tuned in unison with it, but to no other in it, be it ever so loudly, makes any noise. Not only is it not strange, therefore, but quite as might be expected, that we have very diverse accounts of the nightingale's song. It makes different impressions on different individuals, and each one, with equal truthfulness, records his own. So is it that Isaac Walton declares that the song 'might make mankind think mortals are not so well' and that those who hear it 'might well be lifted above earth and say "Lord, what music hast thou provided for the saints in heaven, when thou affadest but moon such music on earth." On the other hand, Ptolemy (or Shakespeare) was of opinion that

The nightingale, if she should sing by day  
When every goose is cackling, would be thought  
No better a musician than the wren.

while Mr. Hawkins strangely describes the song as 'a single but not unpleasantly loud whistle, which on the whole it would probably be true to regard as "dull, monotonous, and unamusing."

Certain features of the song, however, are not mere matters of subjective truth or falsity. For instance, the very common notion that the nightingale sings only at night, is entirely at variance with fact. On this point, Ptolemy's words in her remark to Ninus, already quoted, show that Shakespeare accepted the common notion. But any one who takes a ramble in the nightingale districts—viz, the copse on Lord Bolton's property, a little north of King's Cross in Hampshire, or those lying between Bradfield and Ashampstead, in Berkshire—about ten o'clock in the forenoon or four in the afternoon during the singing season, and he will learn how groundless is the notion, and also satisfy himself that, evening or morning, the nightingale, as soon as he hears distances all other competitors, while Ptolemy's 'wren' is nowhere. Again, it is difficult to see how the epithet 'monotonous' can have been used with reference to the song, by any one who has ever heard it. Indeed, the hurrying rush of melody at one moment, then the perfect trill, then the slow and questioning notes dropped slowly out, then the loud exulting tones that suddenly fill the night air far and near—the adagio, the presto, the forte, the piano, the mezzo, the vivace, which in turn mark its style—not only give it exceptional variety, but seem to bring the varied impulses which find vent in the song almost within the category of human sentiment and human pathos.

On a further point—the difficulty of teaching a nightingale any other art than its own, or other of getting it away from its own inspirations—it would seem that, like a true poet, it must first have its own *dæmon* bide it, or nothing comparing it with the canary in this respect, as Ptolemy says 'If the nightingale is the songster of the woods, the canary is the chamber musician; he first holds wholly by nature, the second asks the aid of art. . . . The nightingale, prouder

of its own gifts, seems as though it would rather preserve them in their purity, at least he seems to set so little value on our teachings that it is with difficulty he can be taught some of our arts. The canary can talk and whistle, the nightingale despises talking and whistling alike, and reverts continually to its brilliant warblings. His throat, its powers for ever new, is a chamber of nature which human art cannot change or improve.' In an amusing fable told in *Method and Genius*, an apologue by Diderot, the nightingale itself is represented as insisting on this characteristic of its singing. In the woods one day—  
The fable—a dispute arose between a nightingale and a cuckoo on the merits of their respective songs. 'What bird,' said the cuckoo, 'has a song so easy, so simple, so measured as mine?'  
Nightingale 'What bird has a song, sweeter, more varied, more brilliant, more touching than mine?'  
Cuckoo 'I say few things, but they are things of weight and of order, and people retain them.'

Nightingale 'I love to use my voice freely, I am always fresh, and I never weary, I inhabit the woods. But as for the cuckoo, he makes them dismal by his monotony. He is so wedded to the lessons of his mother, that he never ventures on a single note that he has not been taught by her. Now, for my part, I recognise no master, I laugh at rules, and what comparison is there between the cuckoo's pedantic method and my glorious burst?'

After a good deal more talk on both sides, they agreed to refer the matter in dispute to a third party, but what was they to find this arbitrator, equally competent and impartial?

After much thought and flying here and there, just as they crossed a meadow, they spied an ass.  
'Ah,' said the cuckoo, 'our judge is excellent. Our quarrel is a matter of ears. Here is our judge, providence doubtless made him for the very purpose.'

As there seemed nothing else for it, the nightingale, despite some misgivings, assented, and they applied to the ass accordingly. He took no notice of them. The birds persisted. Still he came on browsing. At last, his hunger being appeased, the ass turned to them with the air of a chief justice crowning Westminster Hall, stretched himself flat on the ground, and said: 'Begin, the court please.'

Each of the birds gave several specimens of its style. Carried away by enthusiasm, the nightingale would have been singing still, but the ass, who had already yawned more than once, stopped him and said: 'I suspect that all you have been singing there is uncommonly fine, but I don't understand a word of it. It strikes me as barbaric, incoherent, and confused. It may be that you have more genius than your rival, but he is more methodic than you, and for my part I am for method.'

The question as to whether the song is to be regarded as sad or joyous, is twofold. In the first place, it may refer to the sensations of the bird itself while singing, and if it be that he sings with the deep thrum in his breast, as was once imagined, he is in this respect closely symbolic of those great human singers who 'learn in suffering what they teach in song.' This point, however, must remain wholly a speculation, since we can

have no knowledge of the nightingale's feelings  
As Miss Rossetti puts it

'We call it love and pain,  
The passion of her strain  
And yet we little understand or know  
Why should it not be rather joy than woe  
Throbs in each throbbing vein.

In the second place, the quietness of the sad or joyous nature of the song may be referable to the effect produced on the listener himself. One probable ground of the diversity of opinion among those writers who have described the song has already been mentioned, namely, the state of mind of the listener himself. Abundant opportunity of hearing the song both by night and day confirms me, however, in the belief that a certain amount of the discrepancy means just this: that while some describe it from actual experience, others speak of it merely from their knowledge of the conventional notions regarding it.

Wordsworth's account of the nightingale's song is peculiar, in so far as he does not give us the impressions directly communicated to his mind by that song, but rather gives us these impressions in contrast with those produced upon him by a bird of very different voice, namely, the wood pigeon. With the soft cooing of the latter still in his mind, he draws a comparison between it and the strong fiery outburst, the unrestrained passion, of the solitary midnight singer.

O Nightingale thou surely art  
A creature of a fiery heart  
Thou'st notes of thine—they pierce and pierce,  
Tumultuous harmony and fierce!  
Thou singst as if the god of wine  
Had helped thee to a Valentine,  
A song in mockery and despite  
Of sadness and down and a lent night,  
And steady bliss and all the loves  
Now sleeping in these peaceful groves

The prominent idea suggested by these lines does not refer to any question of cheerfulness or the reverse in the song itself; it refers rather to the strange intrusion upon the quiet of sleeping nature of this nocturnal songster revelling, as if inspired with wine, in the delight of his own melody. This view is forced upon the poet by his still having upon his mind the rumour of the wood pigeon, as already stated, of which he in the next stanza so beautifully describes, regarding the wood pigeon

I heard a Woodpigeon sing or say  
His homely tale, this very day  
His voice was buried among trees,  
Yet to be come at by the breeze  
He did not cease but cooed—an I cooed,  
And somewhat pensively he wooed  
He sang of love with quiet blandness,  
Slow to begin, and never ending,  
Of serious faith, and inward gloe  
That was the song—the song for me!

The question here raised is therefore not one of musical preference; indeed, it would be absurd to think that Wordsworth could, in the matter of musical ability, give the palm to the wood pigeon. The question is one relating to the power of association only, and it is not hardening much to say that few who have listened on a summer evening to the plaintive voice of the dove coming dreamily forth from the cool recesses of its leafy retreat, and have felt the associations which the

sound awakens in the mind, but will sympathise more or less heartily in Wordsworth's preference.

Coming back, therefore, to the song itself, the description which beyond all others perhaps bears surer testimony to familiarity with it, is Coleridge's:

'In the merry nightingale  
That crowds and hurries and precipitates  
With fast thick warble his delicious notes,  
As he were fearful that an April night  
Would be too short for him to utter forth  
His low chant and dasher his full soul  
Of all its melody.'

He, it is clear, must have heard the song in all its marvellous variety—listened, not at night to the songsters in their native haunts. That song, as has been clearly pointed out, was heard and described by Wordsworth while under quite other than his than those that dominated the description of Coleridge, yet when we find this difference in two poets, both of whom, however diverse otherwise, were genuine lovers of the night and sounds of nature, it will be all the more readily admitted that the question of the predominance of joy or sadness in the song is in the main subjective—depends on the differing state of mind of those who listen to it, and even on the varying moods of mind, due to varying circumstances, in which the same individual may listen to it at different times. Coleridge, in the exquisite poem already adverted to, after quoting Milton's description of the nightingale's song, from *Il Penseroso* ('The Melancholy Man'), as 'most musical, most melancholy, exclaims

In nature there is nothing melancholy  
But some night wandering, man whose heart was  
pained  
With the remembrance of a grievous wrong,  
Or slow distemper or neglected love,  
(And so poor wretch! filled all things with himself,  
And made all gentle winds tell back the tale  
Of his own sorrow) he and such as he  
First named these notes a melancholy strain

A similar explanation is given by Shakspeare, in the night scene in the *Merchant of Venice*, already referred to. Portia coming up towards the house hears music within, and says to Nerissa

Nothing a good I see, without respect  
Methinks it sounds much sweeter than by day.

And on Nerissa remarking that 'balance bestows that virtue on it, Portia refers to the nightingale's song heard at night in the stillness, and still

How many things by secret seasoners  
To their right purposes and true perfection!

This is so. The times when and the circumstances under which we know or see things, hear music, songs, voices, give a colour or a tone to them, which is indeed something over and above any qualities in those things themselves, yet becomes for us a real and inseparable part of them in all the treatment of pleasure or sadness with which memory hereafter may recall them to our thoughts. It is thus that a word, a flower, a song, anything really, may be transformed in the laboratory of our minds into a medium for

the recall of scenes and events with which it has of itself no connection.

But it has been maintained by some that there is no music at all in the nightingale's song, on the ground that there is no music anywhere in nature, neither harmony nor melody, that the poets have ever tried to throw dust in our eyes in this matter, and that if the truth were told, it would be that music is altogether the creation of man. If all this be so, then rather for me let Truth in this matter still be at the bottom of her well. Why, in a world not overburdened with joy, should we have for ever pressed on us in all directions so much of the

With a eye on the watch to rob  
 Thy fair slumbers?

The impression is that music, be it of air or of nature, which touches our feelings most deeply, is not one always merely of delight. Is the truth not rather that the most intense pleasure is excited, the more surely, too, does sadness mingle with the pleasure? Deep seated in the recesses of our nature there seems to be some common ground on which the apparently irreconcilable passions of joy and sorrow, under certain conditions, meet—some spot where, far removed as are their ordinary spheres, they do it hand in hand, as to a secret host. Moreover, the wondrous song of the nightingale, that transitory visitant of our English groves, may well compel a sigh which we hearken to its music, and think how fleeting, is with other bright and lovely things, is this song hard of night and its passionate melody.

## ONE FAIR, BOTH FAIR;

OR, A HARD KNOD

CHAPTER VII.—BARKA COURT, 79 MIST

THE chambers or office of H and B, so arrive sent young clerk dubbed those alternatively named lights of the law, Messrs Hawke and Heronshaw, were larger, handsomer, better lighted, and furnished in a more modern style than were those of Pounce and Pontifer. There were not, probably, quite so many gilded and carved boxes inverted with the names of so many illustrious families, but for all that, Hawke and Heronshaw had a great connection, and must have netted a large income for many a year past. Mr Hawke himself, a big florid man, with shaggy eyebrows and a track of rattling his moustache which chin, received the fair applicant with politeness, expressed his wish to do his best for a lady recommended by his esteemed friends Pounce and Pontifer, and was courteous and delicate in the questioning necessary to elucidate the points not touched upon in Mr Pontifer's brief note. Altogether, Mr Hawke had very much the look and manner of a consulting surgeon in great practice, and who has come to look on his fellow creatures as very brittle organisms, not to have a flaw somewhere. He was very careful and skilful in the diagnosis, so to speak, of this physical case, but when he had made it out, he knelt his beetling brows and shook his head disconcertingly. 'The thing can't be done, madam,' he said civilly, but with authority. 'I, for one, should recommend you to give up this hopeless attempt, and to effect

a reconciliation with Lady—with your sister— as speedily as possible. Nothing, but distress of mind, annoyance, and waste of money, can accrue from the course of conduct which you now seem inclined to pursue. And I suspect that Mr Pontifer has used much the same language as I have held it my duty to use.'

So he had, and so the client felt, but there had been a difference in the modes of expression of these two distinguished legal practitioners. Mr Pontifer, a family lawyer of the innermost circle of legal Brahmins, had never ceased to feel a human interest in those for whom he carried acres of parchment inscribed with the time-honoured jargon of the profession to be fully approved, and had cherished a well spring of sentiment in the midst of that and desert of legal technicalities wherein he plied his trade. With Mr Hawke it was quite otherwise. He resembled one of those superhuman surgeons who care no more for a patient than the vivisectionist cares for the poor dog that has fallen into his scientific clutches, and who yet risk a great deal for the chance of a cure. With him, law was a game, just as chess and whist, and golf and cricket are games. The clients represented the bulk of the pawns or the pieces of painted parchment, while the players were the legal advisers. But as honest what player will not employ the masked cards which form the shrapnel's stock in trade, and Hawke and Heronshaw would as soon have stood in the pillory at once, as have undertaken the conduct of a case likely to make their name a byword with private and public.

'You will not help me, then, I must go elsewhere, and the client of the Laminator's honour, and as she spoke, her head drooped despondingly forward between her small hands. A window—Mr Hawke's window—was cleaner than those of Mr Pontifer—streamed through the sunset haze, as the sun broke through the fiery summer clouds, and fell on that beautiful head, down bent by sorrow. Mr Hawke never forgot that picture, and never could think of it in after life without a tinge of something like regret. So lovely a creature did seem so desolate a champion.

Presently the vision faded her face and rose from her chair. The blue eyes were hard and stern now. 'I have responded already on your time, sir, and have only to thank you for your advice—well intended, I am sure, but which I cannot follow,' she said coldly.

Mr Hawke was very sorry, so he said, and so he felt for the moment. He had dealt with obstinate clients before, but on their own men, doggedly resolved to fight it out in the last struggle under the banner of a hopeless cause. But there had been bull necked, choleric men, or, more rarely, gaunt, thin lip-spoken spinsters, soured by some family feud, and eager to pursue the legal vendetta to the bitter end. He had never known a mere girl so proud so stubbornly, and while, like Mr Pontifer, he thought the worse of her for being obdurate to his counsels, he grieved for her too, for he thought he saw better than she could do, the shoals and quicksands that lay before her.

'Law is a very expensive pastime,' he said with a pitying smile.

'I thought the very poorest—and I, until I got my own, am poor indeed—might have justice, here in our own England,' answered the rejected client with sudden spirit.

'Heaven forbid it should be otherwise!' said Mr. Hawke hastily. 'No, no, this is no oriental country, where the cash decides for the suitor who can offer the heaviest bribe. With a very clear conscience, you may go into court with empty pockets, and win. But—excuse me, young lady—not one case out of a thousand is quite of that transparent clearness that it appears to be in the excited eyes of justice themselves. A long process is as useful in a lawsuit as it is in actual warfare, securing as it does the best talent and enabling, as it does, evidence to be hunted up from every nook and corner. It is the truest kindness to tell you the unwelcome truth at once. No solution of standing would take up this case of yours without a guarantee for heavy costs, and many, like ourselves, would feel compelled to decline it, even were that guarantee forthcoming.'

A man in her brougham, or rather in her brother's brougham, rattling through the noisy, unsympathetic streets, all tilted with people just lined and hurrying along on their uprush or rush towards Binton Street, the fair applicant for legal assistance threw herself back in a corner of the shabby little carriage and sobbed aloud. But not for long; she raised her head, and, and shook off in an instant every semblance of emotion. 'Shall I give it up?' she said, with a single little smile. 'After all, perhaps I should be happier. But no, never, never, never! No turning back, now. I will go on with it till I die.'

The servant who admitted her when she reached her brother's house, told her that a lady, a foreign lady, as he thought, had called, and would take no denial, and was awaiting her return, in the drawing-room. For a moment she hesitated, but then ascended the stairs, and after another pang of hesitation, opened the door of the drawing-room and found herself, as she had expected, in the presence of Madame de Lorraine.

### CASTLE-BUILDING

BEFORE the rising of that ancient tower upon a plain in the land of Shinar—before the tyr of Orestes in the Greek mythology—there existed, and shall to all time exist, one species of building requiring not stone or mortar or sound of the workman's tool. The architect only is needed. On the boundless plain of his imagination he sketches his mighty plan, spontaneously come statues and murals to the foundation he has fixed upon, up rise the walls, sometimes slowly, at other times with mighty speed. And now the edifice is roofed, the stately pillars support the proud pinnacles, the pinnacles and towers are added, and lo! a castle, the most beautiful that can be conceived by its author. Many a vacant moment has seen its castle reared. By day and night, in sickness and health, as the building goes on. Architects differ, the castle of each seems to him the most perfect. At one time he rears a structure for himself, at another for a friend. How unhappy

would a man's life be if he could not pass some of his time in castle building! He is depressed by the cares of business, but this art carries him far beyond the trammels of his office. He sees the day when he will rise superior to these cares, he will have a splendid house, with magnificent furniture, numerous domestics, extensive stables. Perhaps he will be a bankrupt in twelve months. Never mind that now! He is happy as he contemplates his improved circumstances. He sees his wife happy, his children enjoying themselves with the costly amusements he has provided. Peace be with him! Time enough to-morrow when the castle falls, let him in this brief moment enjoy to the full his fancy's clasp.

Every age—childhood, youth, manhood, old age, builds its castle. The child pictures himself that happy time when he shall be as superior to a child as the schoolboy is to him, and the schoolboy is anxious to realize the important individuality of the multiplacate in his cap and gown. The multiplacate sees himself a Peer or, creating fame in the literary world, the Professor paints an old man who has retired into private life to live on the reputation he has gained by the publication of those works which cost so many hours of anxious thought.

Supposing that these dreams were to end only in a snuff, would the dreamer thank you for waking them to say their castles were but the effects of a mental mist, the idols of a disordered imagination? No, a thousand times would they rather suffer than unmanly to be saved by the ravages of time or shattered by the bolts of experience, only to be rebuilt with more splendid appliances, than that you should by your forbidding in a sudden frost upon the opening bud, hinder the progress of the work.

All castles are not built, however, only to be pulled down again, unless the phrase castle building necessarily means only the forming of those projects which shall have no reality, and may not be applied to the visions which man only removes, but not impossible. Think you, did Homer not look to some of that fun which bids fair to outlast time itself? Did Achilles think his gorgeous tunic would sweep in unspurred pull past no other onlooker than those of the Athenian theatre? Did Ulysses only speak for his client, and had he no visions of the portents that should wonder with admiration at that eloquence which could move the gods? Or can we think that Alexander and Napoleon ventured on their careers doing without any thought but that of present glory, without any hope of leaving a name which posterity would not willingly let die?

Perhaps children in their thoughtful moments build more castles than any of those whom time has taught to be less imaginative. The boys look forward to the day when they shall have a watch, a pony, or a boat, and fancy themselves an important person; that follows them as the happy possession of those treasures now appear

to them. Little girls, as a rule, have a morbid craving to arrive at an age when some Prince of their imagination shall come and wed them. Many an invitation have we had, sixteen or eighteen years beforehand, to 'come to my wedding.' Again, some little mother in embryo sees herself in the mental mirror taking her young family out in her carriage, as her mother now takes her, or ladding them good night when they are trotting off to bed, and she has been exacting to the dignity of going out to dinner. How happy the little men and women feel in these blissful moments! Unfettered by care, ignorant of the storms which shall shake and overturn their pretty structures, they build on and on, till, as they grow, soaring and rooking and furnishing, those castles, in which the bright eye of childhood holds each strength, but which the more experienced eye of a few years to be weaker even than rubs. Bless them! Though we know better, we cannot choose but let the little owners take our hands and lead us through those halls so spacious, those rooms hung round with the pictures in richly gilded frames, those gardens full of Nature's sweetest offerings. And you, little fairy, with your dark hair and lustrous blue eyes, your ringing laugh and loving smile, how will your castle stand? Will you be the happy mother you fancy yourself, with all the comforts which you think riches can bring? Or will you be the child of idleness, compelled to go out early and come home late, slaving your young life away to earn that scanty pittance which even the smile of contentment can hardly make sufficient to support your ruling mother? Or will the kindly life you gather you amongst the roses, transporting you from the toils and the sorrows of a sinful world to that heavenly choir where anthem is swelled by the sweet voices of the little children? Who knows? God bless you my dear! It is your innocent gaiety that brightens the dismal lot of many a struggling traveller over the stony highway of life.

And, Schollie, what plan have you drawn out? Are you going to win the prize every term? Are you to be lifted up over the heads of boys older than yourself? Will you risk two or three years more to be the 'prince' the dream amongst your fellows? Will you deliver the Greek oration on 'speech day, walk proudly up to receive your last prize, be a practical proof as Captain of the Eleven, that the best at work is often the best at play, and take your leave of the little world in which you have passed the best years of your life—ay, the very best—almost before the sounds of *Auld Lang Syne* and 'Three Cheers for Princes' have died away? Will you carry off the first scholarship at Trinity or Birkol, and proudly ask the 'dear old Doctor' to give the college a holiday in your honour? Will you, while reading hard, win your 'blue' in boxing, cricket, or athletics, and then luxuriate in 'all the dearest things the fellows at school' will say of you? And at degree time will you be Senior Wrangler or get a Double First, and so perpetuate your memory among the schoolboy generations which are following you? My dear boy, I hope you will do all this, and more; but remember that every one cannot be head of the school, that there are very few who can take those scholarships you

are striving for, that not more than eleven can uphold their crackling reputation against the senior 'varsity,' that there can be only one Senior Wrangler. Build the castles by all means! Such labour is not only natural but inspiring, and if you strengthen every joint with hard and honest work, it will not be your fault if the walls do not hold together.

And you, Man of Business, who have not seen a brilliant career at the university, what castle are you building? Is it one which is reared slowly, but every stone of which is carefully laid, every aperture thoroughly stopped, every joint firmly secured? Or is it one which, to look magnificent, rises quickly, and apparently just as firmly as the other, but to the careful eye shows signs of scampering, and bad work here and there, and yonder? The lifetime which is not honestly acquired will not make you happy. To be lasting, your castle must be of the former kind.

And you, Old Man, what are you planning as you sit in your armchair before the fire? Are you picturing yourself almost young again, recovered from that hacking cough, or able to see the sun through half-shut eyes? Or have you given up all hope of recovery, and seem to sit in that fire your children in the enjoyment of a happy old age, secured from want by the only labour of their father? Do you see a daughter coming with loving hands to plant on a hallowed grave some few flowers, a small token of her love for him who has gone before? Do not such visions seem almost to reconcile you to your invalid life?

How should we be without our castles? With out them we should be dull as ivory in want when no pleasure was upon our minds. Still would be our pleasure in children if we could not go building for them. We could not sympathize with our boys and girls unless we are able to remember that when we were boys or girls stately edifices rose in our imaginations—only to fall presently, their ruins, however, forming the materials for a stronger and more compact fortress.

What a state to such building must be the literary man! How rudely have some of the fables which our poets raised born and reared upon by the world, until, after their creator's death, they were rased and snow, and now stand secure. That wonderful success which Milton hoped for his long contemplated epic was for many years little more than an empty vision, until at last, from what seemed almost a pile of ruins, there arose that castle built by the master brain of the old Puritan, having its battlements garnished with all the heroes of antiquity.

How many a struggling young doctor or business young barrister has been sustained only by the building of castles for his future!

But how many live only by this amusement, committing to put their shoulders to the wheel of life, but going on from day to day dreaming that there is a better time coming! Such can never prosper. Their experience teaches them, apparently, nothing more than to build on the ruins of the old house, which was itself originally on the sand, and when the rains of adversity descend, and the floods of pecuniary misfortune come, their walls will be entirely swept away, and the builders will then perhaps realise the

fact, that castle building, if one of the pleasantest employments of life, is but a poor trade by which to obtain the wherewithal for filling the hungry with good things.

## OUR NEW MANAGER

### IN FOUR CHAPTERS—CHAPTER III

Two weeks rolled by, the year wound to its close, and in the interval the new managing partner in the firm of Messrs More, Hartley, & Co. had quite justified the rumours which had preceded him respecting his energy and dash, as well as his severity in the matter of discipline. Two or three of the oldest servants in the firm had been dismissed for what, in their comrades' eyes at all events, were but minor faults, their places well supplied by strangers, all evidently devoted to Mr Pike, and, as a natural consequence, the whole of the staff felt nervous and on edge.

Among others, Philip Hartley felt that he was by no means making way with the new manager, of whom he saw very little. So rarely did he come into contact with him, that he began to think this was the effect of some deliberate arrangement, an idea by no means pleasant. And he was reminded by occasional meetings that the circus had not yet left the town, and that his friend the tramp was still engaged there.

Many other things of interest to our characters had happened since the close of our last chapter, but up on these we cannot now dwell.

The wind was howling loudly and the rain was as it blew in from the sea, and intermittent showers of cold rain were driven before it, rendering the short dark afternoon towards the end of November darker and darker still. The heavy clouds which drove from time to time before the gale darkened the landscape, as though the coming twilight were already there, while the rain was heard beating fiercely against the windows of Ironbow Cottage, in the front parlour of which sat Mrs Valens and Mrs Darnley. The latter had evidently just arrived, for the hostess was saying, 'I begin to think I should never see my young friend again, it is so long since you were here, but I certainly did not expect to see you on such a day. You may have, indeed, my dear, to venture out.'

'It did not rain when I started,' replied the girl, 'and I felt that I must come and see you, and so I—'

'Well, my dear Marian, whatever the cause, I am very glad you had the courage to come,' said Mrs Valens, as her visitor filtered and purred in her speech, 'and now you have to tell me all the news—Is Mr Philip made chief clerk yet?'

'No—no,' returned the girl.

'Well, then, has your new manager displayed any fresh excellences?' resumed Mrs Valens, after a glance expressive of some surprise at the unwonted brevity of her visitor's speech, 'or has he—' But, my dear child, you are ill—or there is something disturbing you. Has any trouble brought you out to me on such a day? It might have been a momentary brightening of

the gloomy sky which enabled her to see her visitor's face more clearly, or there might have been a change in the face itself, but Mrs Valens rose as she spoke, and went close to the girl, touching her brow with a tender and sympathetic hand as she did so. This touch was all that was needed to make the waters burst forth, for Marian leaned her head against her friend's breast and broke into a fit of hysterical sobbing.

'Oh, I am so unhappy!' exclaimed the girl at last. 'I am so wretched and miserable, that I came over this afternoon on purpose to tell you all, and to ask your advice. I did not mean to behave so foolishly, she continued, with another effort to smile, 'and I am so sorry I went on so.'

'Surely you have not quarrelled with Philip?' began Mrs Valens.

But the girl interrupted her passionately. 'Oh, no, no! My dear Philip is as desiring as myself, she exclaimed, 'it is all through that wicked, cruel man whom we thought so good—that Mr Pike.'

'Mr Pike?' echoed the elder lady. 'I thought that he—'

'So did we,' cried Marian, anticipating the remark. 'But he is so wicked and so cruel. You know how he helped my father to enlarge his business, and you know how he came over after that concert. Well, he never would settle the terms upon which my father was to have all this timber, and so forth, he always turned every discussion off with a jest, so that father believed he could settle on his own terms. Then he came over to our house three or four times a week, almost every day indeed, and now all at once he demands large payments from us, and says he must employ a solicitor. If he does, it will quite ruin us, as father has sold all these goods on long credit. We expect to have a suit served on us at once, perhaps this very day, unless—unless—' here the girl wept so bitterly, that she was obliged to pause. Mrs Valens did not speak, but her stern frown and tightly closed lips seemed to tell that she already guessed the story she was about to hear—'unless I will give up Philip, and marry him, and the girl at last. 'Philip knows of it in some way from the people at the office, and he is half frantic. One of the principal men advised him to leave, as he was sure Mr Pike was bent upon his ruin.'

'But Philip will never give you up, I am sure,' began the elder lady, 'he had better resign.'

'He would resign, to be sure,' exclaimed the girl, 'he so distrusts and distrusts this man. But what is my father to do?'

Mrs Valens tried to soothe the excited girl, though unable herself to suggest any real consolation, especially as further questions showed, so far as Marian understood the business, that her father's position was extremely hazardous. The lady had discussed enough, however, to advise the girl not to sacrifice herself on any account, believing, as she told her, that her father would fight it as much as herself, in time to come.

Marian promised to adopt this advice, which was of course in accordance with her own wishes, but her friend could see that this resolve was qualified by the natural horror of being accessory to the darkness and downfall of her father.

After this conversation, Marian declared she

must go home, having promised to return early. 'You cannot think of returning at present, my dear!' exclaimed Mrs. Vallens. 'Listen, how the wind shakes the windows, and how the rain is beating against them! It is quite dark now, so you will gain nothing by hurrying.'

But this would not satisfy Miriam, who had promised to go home, and so earnest was she, that Mrs. Vallens dreaded to excite her further, and so was fain to allow her to set forth.

Mrs. Vallens accompanied Miriam to the front door, which she opened. The night was nearly dark, not quite so black as it would become in a short half hour, but the two ladies could only just distinguish the dull grey road, and the outlines of the trees as they were bent by the blast, which raved past in furious gusts. They could not see the run, but they could hear it.

'It is a fearful night, my child,' said Mrs. Vallens, 'and you will—' Ah! there it came. As she spoke, a vehicle turned an angle of the road and approached the cottage, evidently on its way to Bithfield.

Mrs. Vallens waved her hand and called to the driver. Her call was probably not heard, in the howling of the wind, but there was a light behind him in the hill, and his figure was seen. The vehicle slackened, then it hitched up before the gate, and the driver, alighting in his streaming oilskin cape, came towards them.

'Are you empty?' asked Mrs. Vallens. 'Can you take a fare to Bithfield?'

The man did not reply for a few seconds, and thinking he had not understood her, Mrs. Vallens was about to repeat the question, when he said, 'Do you want to go into the city, ma'am?'

'No, it is this young lady,' returned Mrs. Vallens, 'who wishes to go to the Lower Down Road. You can take her, I hope?'

'It is Miss Dunnet, I see,' said the man, touching his hat. 'I have the honour of knowing her friends, so will take her, although I am not on regular business now. I drive only now and then,' he continued. 'Nobody has expressed any desire for further detail, but he went on. 'I am employed at the circus, but they have taken out a driver's licence for me, and I was going to bring a lady and some children to Bithfield.'

Mrs. Vallens at first had frowned at this language, but an idea struck her as to its cause, which changed the frown into a smile, and calling to her servant, she desired her to bring a lady and water into the hall.

'You can drink a glass of something, before you start, my dear,' she said.

'Well, yes, ma'am,' replied the driver, who had a curious way of giving the person to whom he spoke so closely as to be rather unpleasant. 'Not that I am given much to drink. I have not drunk more than would do me good at any time for this four years.'

'I am glad to hear it, coachman,' said the eldest lady, as he passed. 'Here is your lady and water, but do not drink it now, if you have any objection.'

'No objection in the world, ma'am,' returned the man, taking the tumbler, 'and here are my best respects to you, ma'am, and the young lady.' The curious searching look was very strong upon him as he spoke. 'But as I was saying, ma'am,

I left off drinking in consequence of my nearly having a fatal accident. Ah! it must be five years ago, now I come to recollect. I was abroad at the time.'

As he passed here to take a second draught, Mrs. Vallens said, 'Now, my dear!' to Miriam. But the driver's narrative was not quite finished. 'Yes, ma'am,' he resumed, 'I was in Gibraltar at the time.'

'In Gibraltar?' exclaimed Mrs. Vallens, with more of interest and surprise in her tone than she had yet shown.

'Yes, ma'am. I suppose you've heard of the Rock of Gibraltar?—You have? Perhaps you've seen it, ma'am?' continued the driver.

'Yes, I have. But my young friend is in haste to get home, and I must ask you not to delay,' said Mrs. Vallens. Her latter words were spoken rather sharply, as if she were vexed with herself for having been led to admit anything so such a man. The driver took the hint, and touching his forehead, he said, 'I will do the best I can, and open the door, Ma'am following and entering the vehicle.'

As they drove off, Mrs. Vallens said to Miriam, who was an old familiar servant, 'I almost decided to let Miss Dunnet go with that man, his manner was so strange.'

'Let him go, ma'am?' exclaimed the attendant, 'he is all right, ma'am, it is only his way. I know he belongs to the circus, as he says, but I have seen him about the docks every time I have gone into the harbour, for months past.'

This was to a certain extent interesting, but the features of the man and the sound of his voice haunted the lady in a most unaccountable manner.

Had Mrs. Vallens, or any one else in the house, dreamed of testing the correctness of Miss Dunnet's story, no great trouble need have been taken to prove its perfect truth, for, as it happens to most men who fall in love when past the heyday of life, Mr. Pike dropped more carelessness in proving his suit with the girl of whom he had so unduly become fascinated, than would have been shown by many a man, but who had the hot blood and inexperience of youth to excuse him. He may have intended to be guarded at first, but the opposition is not with standing the torrent it was intended to check, and while half hand-mouth was aware of his suit, the whole of his establishment made common discourse of his infatuation.

Probably Mr. Dunnett had been too common-sense amongst his friends, perhaps it was merely official civilities which gave an inkling of the secret, but certain it was that several of the staff in Mr. Pike's office were very well informed of the position of affairs—as Philip Hurlby found. He had received several plain hints, and some well meant advice, while the distrust of Miriam, and the ominous silence of his father, showed that those who took the gloomiest view of Mr. Pike's tactics were likely to be right, but he had never received such detailed and definite information as was given to him on one particular afternoon, just as he was leaving the office. He happened to be the last who left on that occasion, and as he closed the office-door after him, he found, standing outside, a clerk whom he had

seen go out fully five minutes before. With a friendly nod and word of greeting, Phil was passing on, when the clerk stepped close to him, and said in a low tone 'I was waiting to see you, Mr Harkby. I will walk a little way with you, if you have no objection.'

Phil was rather surprised at this mysterious commencement, but expressed his willingness to have the young fellow's company.

The latter continued 'I hope you will not think me intrusive, or as meddling with what does not concern me, Mr Harkby, if I tell you that I have learned something about Mr Dunett and his family.'

Phil started visibly upon hearing this, but did not speak.

'I have no doubt you know,' continued the clerk, 'that what the governor wants, and will have by fair means or foul, is to get Mr Dunett's daughter to marry him.'

Harkby could not repress a slight groan in reply.

The young man looked at him for an instant with an air of commiseration, as though he thoroughly sympathized with him, and then hurriedly proceeded 'He will have her too, sir, if it is to be done. I know that some of the men who have fought here old Dartmouth cannot meet their bills, which were given on the express understanding that they should be renewed, but—and here comes in the worst—Pike's solicitor has got them from the man who denounced them—of course you can judge who cut him to work—and he will not renew. The consequence is, that will be a smash, and poor old Dunett will go first. I am afraid you can't do much, Mr Harkby, but although it was hardly business-like for me to mention what I had heard, I could not help giving you a chance to see if anything could be done.'

Harkby wrung the young fellow's hand and thanked him briefly, but as the clock approached, he did not think how truly his informant had spoken when he said he feared Philip could not do much. What could he do? If he held Murray to her engagement he believed she would be true to him, although she died in the struggle. She must suffer, while her father would be rewarded, and his gray hairs indeed be brown, but with reason the grave. That he himself would suffer also was certain, but he was manly and resolute enough to be comparatively little about this, even although he had reason to think his disagreement with Dunett was included in the proceedings.

In this depressed mood, he felt no inclination to go home, but walked aimlessly about the town until—when he had quite forgotten where he was—he turned a corner, and came suddenly upon the great circus, now just bursting out into a blaze of gas, preparatory to the opening of its doors for the evening. As Philip crowded his way down the by street along which the side of the circus ran, he heard his name pronounced aloud, and looking round, saw, somewhat to his vexation, the man who had been engaged in the quarrel with Mr Pike. At the moment, he would have preferred seeing almost any one to this man, so, with a brief answer, he was hurrying on, when the other called to him again.

'What do you want?' returned Phil, with a touch of irritation in his voice.

'Why, I want you,' was the answer. 'I've been trying to get round to your place all the afternoon. Can you see me after the show? We close at a quarter after eleven.'

'What for?' was the natural inquiry of Philip.

'What for?' echoed the other, with an expression of contempt. 'Why, if I had got time to tell you now, do you think I should want you to come round then? It is on your business, not on mine, that I want you, and the question is, will you be here at a quarter after eleven, or won't you? Just say yes or no, for I've got to drive and be in the ring in half an hour.'

'Yes,' said Philip, who was impressed by the man's earnestness.

'All right, master,' said the man. 'I will be there for you, and your time won't be thrown away.' With this, he vanished behind the canvas door at which he had been standing.

During the remainder of that evening, Phil kept up an incessant speculation as to the result of this extraordinary appointment. So minutely he thought over his mind, he disregarded it, as founded on the ravitations of a youthful imagination, but in this speculation was fairly found in his mind, the remembrance of the man and his strange conversation vitally brushed it and lit it into something like alarm, and a dread of some yet more unusual revelation.

He did not, however, fail to keep his appointment, and stood in the shade of the circus walls just as the nearest church clock chimed the quarter. He had met the crowd, which flowed like a tide from its gates, as he arrived, showing that the performance was concluded, his associate was not long behind him.

'Here you are, master!' exclaimed the latter, as he emerged from the circus, huddling in his shabby greatcoat as he came. 'That's all right! Now, I won't keep you long. Just come into the Backroom. Alone, but it is precious cold here, and I will get to business in a minute.'

The circus man—Phil did not know his name—ordered some ale and then, after making sure the door was carefully closed, said 'Look here, Mr Harkby! I told you I would do you a good turn whenever I could, and I am going to do it now. I've knocked about the world a good deal, and I never knew any one do a kinder thing than you did when you gave me that half crown on the night when poor Tim was killed. Says I "That young fellow is a good un, and I'll be after him if I can."

'You are quite welcome,'—he said in Philip.

'Oh, come!' I saw that,' exclaimed the other. 'But don't you interrupt me. Now I'm a just how affairs are with you and that pretty girl in the Lower Down Road, who used to be so smiling when I first came here, but who droops so much now. Not that there is anything wonderful in my knowing it, for I believe all the town knows. One of my friends—as friends go, you know—as a lawyer's clerk here, and he owes me a little money. As you know what I have been, I don't mind telling you that I won't at all mind. Well, I have heard a little from him. I let him off easy, on account of his giving

me the straight tip I know he could do it, if any one could, because his master is the lawyer employed by your precious Mr Pike. I know Pike. I go here under the name of Jon Whittaker, which is no more my name than it is yours, but it is as much my name, as Pike is his.

'Indeed!' exclaimed Philip. 'I did not want him to get a good sight of me on that night, because—well, for the same reason which keeps me from coming forward now,' resumed Mr Whittaker. 'If I want going on in advance for our people in a couple of days, I don't think I should like to interfere in the matter at all. Now, I want you to promise me to do something,—will you give me that promise?'

'I will, if I can, do anything reasonable to serve you,' said Philip, after a moment's hesitation.

'Come me! Why, it's you that is to be served!' exclaimed Mr Whittaker. 'Now, listen, speak to that pretty girl, and tell her to get her friend from Lancelow Cottage, to be it her house to-morrow.'

'What! Mrs Vallens?' cried Philip. 'Why her—and why to-morrow?'

'Mrs Vallens, I do say it is,' resumed the other. 'Anyhow, we'll say so. To-morrow, I can tell you, from my friend, Mr Pike, will call on the house in Lower Down Road for his answer, and he will have it one way or the other. Now, mind you tell Mrs Darnett to have Mrs Vallens present at the interview, just as if it was her friend, that's all. Without her, the girl will be crushed and frightened into saying anything, but I know Mrs Vallens influences with the family will ease her. Do you promise?'

'I will,' said Philip firmly. 'That's enough,' said the other. 'I'm off now. You want as much more of me, but you may let it from me. You will soon know whether my information is good or not. If you don't get the sack from your place to-morrow, put me down as a duffer. If you do, you will know I have had the straight tip. I have paid you back your hall crown now, and returned your kind feeling for your 'lany.' He went out at once, and Philip, finding no further reason for delaying, followed his example.

### LONDON AT SUNRISE

On a bright May morning, one may easily pardon for touching upon a theme which, old and well worn though it be, is not therefore, and can never lack novelty, even though its novelty comes only from want of familiarity, on the part of the vast majority of Londoners, with the great city under its most favourable aspect. But Ben has already tolled the hour of three A.M., but the light in the clock tower shows that the House has not yet finished its night's work. A crowd of housemaids and a few carriages surround the door of Westminster Hall, their drivers looking lagged and weary in the gray twilight, yet waking up into momentary activity on the approach of a pedestrian. 'Cab, sir?' comes from numerous lips as we emerge into Palace Yard, but 'the air takes

shrewdly,' and a brisk walk along the Embankment will be more agreeable this morning than facing the east wind over the door of a hansom. So, crossing Bridge Street, and lighting a consolatory cigar for companion-ship's sake, we choose the river side of the great London boulevard, and set our faces eastward.

The Thames is at its best, the tide almost at full flood, and daylight still dim enough to conceal the muddy hue of the stream, and the floating refuse which experience tells us is scattered over its surface. The gas lamps on Charing Cross and Waterloo Bridges show pale against the eastern sky, and are acutely reflected in the water, which is already assuming the cold chilly tint of the coming dawn. Half a dozen heavy sombre looking barges are lazily floating up against the tide in mid stream, their occupants idly smoking their pipes on the deck, and occasionally taking a pull at the sweeps, to guide their craft safely beneath the dark arches. From under the latterly doors comes the puffing of an obnoxious river tug, which, in its furry bustling, method of proceeding, seems to elum for itself an undue share of credit for being up and doing at this early hour. A few carriages pass us, bowling silently over the gravel road, on their way home from some City Company's ball; but the pedestrian element is awaking, save for the blue coated policemen, whose presence in unusual number, coupled with that of three or four mounted patrols, calls to mind the evil notoriety which the Embankment has recently acquired.

Daylight is asserting itself boldly by the time we reach the railway bridge at Charing Cross, and as an early morning train enters the terminus, there is no longer sufficient friendly twilight to hulk the deficiencies of the comfortable boxes which the railway Company consider good enough accommodation for their heavily mulcted passengers. And now the finest scene which the Thames in London can afford has open before us. In the foreground is the rippling surface of the stream, spanned by the handsome arches of the finest of the metropolitan bridges. Rising apparently from the very centre of the bridge is Sir Christopher Wren's massive masterpiece, the cathedral dome of St Pauls. On the left above rises the lofty White Tower, looking quite picturesque in the half light, which does not yet reveal its unpicturesque surroundings, while on our own side the grey facade of Somerset House appears in the best advantage, set off by the young foliage of the Embankment gardens between us and it. Through one of the arches we can catch a glimpse of the Temple, and beyond it, of the fresh white frontage of the new City of London School, while in the distance, Blackfriars Bridge shows a line of glimmering lamps, and mercifully commends the unwhitely iron span of the Chatham and Dover Railway beyond. There or four heavily laden market carts, piled high with green stuff for Covent Garden, crossing Waterloo Bridge, and a smart crew of the river police, making their boat jump through the ripples, serve to give life to the scene, while the sky is already putting off its gray mantle, and shows blue enough for Italy herself, promising a summer like noon, and at present dappling the clear surface of the river with spots of shadow from the fleecy

cloudlets which drift westward before the rising breeze.

But Somerset House and the river front of King's College are already passed, and our route takes us up the steep ascent of Arundel Street into the busy Strand, busy even at this abnormal hour with the unresting traffic of the great city. Hansom crows lazily along in languid expectation of a belated fare, but there is a ceaseless rattle of hoofs and wheels, as the red cabs—each bearing the legend 'W. H. Smith & Sons'—come with one horse, some with a pair, and all piled high with sales of newspapers, the driver sitting half buried amid the records of the events of the last twenty-four hours—hasten about their business. One stream sets westward, coming fresh from the printing houses to the headquarters of the firm. Others are already starting for the railway termini. Others deliver up their loaves in time for the newspaper firms. Boys loitering under potentuous loads of papers push and struggle along the pavements with supplies for less enterprising news-vendors, and the investment of a penny enables us to read at Temple Bar the telegram despatched a short hour or two since from New York, as well as the speech delivered an hour ago at Westminster. But the newspaper will keep till breakfast time, and must not be allowed to interfere with the unwelcome opportunity of studying the Strand itself.

Now of those whose daily occupations lead them to traverse the London thoroughfares could give the slightest description of the buildings they pass. Time is too precious, and the necessity for keeping a sharp look out on all sides too urgent, to allow the eyes to wander many feet above the pavement, and it is only at these quiet hours of the morning that the wayfarer can look about him with impunity. There is something peculiarly quaint about the architectural features of the Strand, and the three quarters of a mile which separates Charing Cross from the Griffin Inn—perhaps the most irregularly built street in the whole of the metropolis in area. The houses seem rather to have dropped into their places accidentally than to have been built with any design, and the churches of St. Mary and St. Clement have an equally inconsequential appearance. But it is only the eastern end of the river-street which concerns us now, and of it so much has recently been, or is at present in process of being, rebuilt, that its quaint character is almost a thing of the past, and we find a difficulty in finding the tower of St. Clement's crowned with cannon to overawe the turbulent Earl of Essex in his mansion at the corner of Essex Street, or in more recent times, the meetings of the town with at George's Coffee-house, now the *George Hotel*, and the adjournments of the hot-headed disputants from the Grecian into Devereux Court, in order to settle their differences as to the etymology of a Greek word by an appeal to the sword. The Grecian is now let out in chambers, and Devereux Court is an orderly thoroughfare. Temple Bar has resigned in favour of a monastery; and the famous Coal, though its sign still stood resplendent over the doorway, until barbarously removed from thence one night during the last year, is shorn of its former glories. Dick's Coffee-house survives only in name and in the pages of the *Teller*, and the so-called Palace of

Henry VIII. and Cardinal Wolsey is a hair-dresser's shop.

From these scenes of past glory we turn through the Temple gate into the quiet sleep-bound precincts of the law, undisturbed as yet by the footfall of the matutinal 'laundress' or the shrill whistle with which the boy elicits will make noontide huddles in the course of a few more hours. We pass the vacant space where a short while ago stood the ancient dwelling place of Oliver Goldsmith and Sir William Blackstone, and as the clock of the Middle Temple Hall strikes four, we pass beneath the archway and look down over the well kept grass plot and as yet empty flower-beds of the Inner Temple. The air is full of the chirping and twittering of innumerable sparrows, which make their haunts in the Temple plane trees, and seem to be striving to elude themselves and their audience into the belief that they can vie in vocalism with the best of country birds. Nest-building is progressing rapidly under the sheltered window ledges, and even as we glance upwards comes a vigilant cock sparrow, leaning in his beak a most unsteady twig, a very beam for his mode of building purposes. He alights on the ledge, and with the aid of his mate, strives to accommodate his prize to the purpose for which he brought it, but it proves too much for his powers, and in an unguarded moment he loses his hold, it falls gently to the ground, and landed by his failure, he instantly follows it to earth, but a rival claimant is already in the field, another watchful gentleman of the same tribe has seized the treasure, and at once a battle royal ensues for its possession. Flushing, pecking, screaming, they wheel round and round the bone of contention, growing at last so eager for the settlement of their small claims, that neither notice how a light gust of wind has stolen round the corner and swept away the subject of their dispute. Ah, foolish birds! not to recollect, even in the very sanctuary of the law, how frequently the substance of litigation passes from the would-be grasp of both litigants into the hands of the third party who steps in to settle the dispute!

The quarrel thus decided, we climb to our domicile, to experience, as the first who enters a room in the morning must always feel, how cold and cheerless the familiar spot looks in the morning light, with empty grate, and all the litter of the previous day as yet untouched away. Books and papers look less in viding than usual under such circumstances, and we turn all the more readily to our more glum of the outer world. It is a scene not to be forgotten. The clear blue sky is unclouded by the smoke and soot of London noontide. Here and there, a streak of pure white steam mingles the spot where the busy press is still panting and throbbing forth its mighty message to the world. The spire of St. Bride's peers over the red tiled roofs of King's Bench Walk, looking like a Gargantuan telescope which some droll and gone astronomer has forgotten to close and put away, while above the slates of Paper Buildings rises, solemn and stately, the majestic cathedral dome, tinged already with the coming brightness of day, its golden ball shining like a mimic sun, and the cross above it standing out in bold relief against the sky. Five minutes more, and the grandeur of the scene is complete, as the sun rises into sight

directly behind the cathedral hooding, with light every shadowy corner of the fine homestead buildings around us, and showing that the very city itself can appear picturesque, and even beautiful, when divested of its ordinary busy crowds of toil worn, anxious gaited men.

### A DRAWING ROOM COMEDY

MR THOMAS BILBURY is the junior partner in the great firm of Bilbury, Pluckthorne, & Co., tea merchants, of Calcutta and London. The senior partner is Mr Joseph Bilbury, his father, who has a very nice house at Kew, and until within a year or two ago, there was a third member of the firm in the person of Thomas's uncle, Mr Pablinson Pluckthorne, the Calcutta representative of the establishment. But, unfortunately, Mr Pluckthorne, like every Englishman who lives in India, drank too much brandy whisky and brandy, and ate too much curry and too many "Bombay ducks," the result being that at the age of fifty-five his liver declined to bear the strain put upon it and collapsed, leaving its owner so weak and ill that he had barely time ere he died to telegraph to his partners in England a brief notice of his resignation. This alarming dispatch raised it a particularly important moment. Mr Thomas Bilbury hit on the day previous married a very charming young lady, Lydia Lipples by name, and the intelligence of his uncle's sad condition necessitated that the newly made husband—well, by the way, had only become acquainted with his bride at not six weeks before marriage—should without a moment's delay take the train for Dover, cross to Calais, and thence go by the quickest route to Calcutta. The affair was pressing. Mr Pluckthorne's death would certainly throw the business into confusion, and any hesitation on the part of the English partners might imperil the future of the firm.

"Go at once, my dear boy," wrote Mr Joseph Bilbury to his son, who was in the thick of Wright, "and send your wife to me. I will take care of her and see her settled in your new home at Richmond. I would do myself, but my gout won't allow me. And above all things, take care of your liver."

There was no help for it. Mr Bilbury, junior, felt that he must, so he did, putting the best face on the matter, and bidding a very long and tender good bye to his poor little wife. He escorted her a long way to Portsmouth, put her into a London train, kissed her, saw her off, and then took the next train for Dover.

She settled down in her new home on Richmond Hill, and he for many months afterwards worked hard at his desk in Calcutta, transacting the worldly affairs of his dead uncle, and from time to time sending home reports of his progress, and love letters to Lydia.

Two years, in fact, elapsed ere he was able to return to England, and then he returned, as

he had gone out, at a moment's notice. Unforeseen circumstances suddenly left him free, and, unwilling to lose a day, he took the first homeward bound steamer, which, so it happened, was also taking to Richmond a letter, written a few days earlier, in which Mr Bilbury, among other matters, re-iterated to his wife that the pressure of business would not leave him at liberty for at least a month.

He travelled home without adventure, landed in due course at Dover, arrived in London late at night, and, without having written a word of warning to Lydia, hurried on next morning to Richmond Hill. Why he did not write or telegraph, we cannot say, perhaps he thought his sudden appearance would agreeably surprise his wife, or perhaps he was too excited to be able to think at all. But in any case, he neither wrote nor telegraphed a single word of preparation.

It was a fine sunny morning in summer, Mr Thomas Bilbury had scarcely reached his new home, which he had taken in a hurry immediately before his wedding, and he was walking eagerly up the short carriage drive leading to the house, when, happening to cast his gaze towards the upper window, he caught sight of a fair, white draped figure, which was watching some flowering plants that stood in a row on the wall. He at once recognised the figure as that of his wife, and was about to utter a cry of salutation, when he suddenly became conscious that she did not recognise him, for, with graceful modesty, she withdrew from the window and disappeared as soon as she became conscious that he was watching her. An idea struck him. It was a flash, but a wholly unnatural one. He would pretend to be some one else—a friend, say, of her husband's, and would talk to her as such. Of course she would at once recognise him, but then the surprise, and the consequent pleasure, would be the more complete if he then admitted them. He knocked, therefore, at the door, and to the servant who appeared, announced that he had just returned from India and desired to see Mrs Bilbury. He gave no name, but he was admitted, and shown into the drawing room, where, in some perturbation of mind, he awaited the advent of the wife from whom he had been so long and so cruelly separated.

"I suppose that she will know me," he reflected, as he stood with his back to the window, "but it is from that I have grown a tolerably big beard since I went away, and that I have become considerably tanned. However, the beard ought to make no great difference. I suppose that she would know me if she saw me in my shirt sleeves, or with both legs cut off at the knees. On the other hand, she thinks that I am still in Calcutta, for she must have had my last letter this morning. I hope my sudden appearance here won't upset her. I must be careful."

Here his thoughts were switched aside by the unmistakable sound of rustling skirts in the

passage without, and as the door opened, he involuntarily turned and gazed into the garden, at the same time coughing nervously.

'May I offer you a chair? I am afraid that you find the open window too much for you, said a soft voice behind him.

'O no, not at all!' he returned, fixing his wife for an instant, and then hastily resuming his survey of the garden.

Mrs Bilbury did not in the least recognize her husband. 'Do let me order a fan to be brought, she urged.

'O no, not for worlds!' ejaculated Tom, as he turned slowly round, conscious at last that even his nervousness was no virtue for his rude now. 'But the fact is, Mrs—'

'My name is Mrs Bilbury.'

'Oh! think you so?' The fact is, Mrs Bilbury, that I am not yet entirely accustomed to this abominable English climate. I—ah—that is to say, a man who has existed in groves of mango—ah—and has lived on curry and chutney—ah—with the thermometer standing doggedly at a hundred and two in the shade, is—ah, but I dare say you understand.'

'Oh, perfectly, Mr— I think I have not the pleasure of knowing your name.'

'Who am I?' thought Mr Thomas Bilbury. 'My name,' he said, after a slight pause, 'is Bilbury.'

'What a curious similarity!' said his wife—'Yes, I can readily believe that people coming home from India had this climate very trying. At first, even in summer, Mr. husband writes that the heat in Calcutta has been excessive. Possibly, Mr. Bilbury, you may have called to give me some news of him? I hope so. I thought that his last letter was not written in very good spirits.'

'That is satisfactory,' thought Mr Bilbury. 'The lips of two years has not altered his love for me.'

'Yes,' he said aloud, 'I can give you some news of him, for, a month ago, I was at Calcutta.'

'Indeed! How delightful!—Do sit down, Mr. Bilbury. It is very pleasant to meet any one who has seen my husband so recently, for I gather from what you say that you have seen him. How was he?'

Mr Bilbury was by this time much overworked in his mind as to what to say next. On the one hand, he was afraid to declare himself, for fear of frightening his wife, on the other, he rather enjoyed the situation. He therefore determined, for the present, to utter his incoherence.

'He was,' he said with deliberate hesitation, 'as well as could be expected.'

'As well as could be expected?' repeated Mrs Bilbury with alarm. 'Do you mean that he has been ill?'

'Well, not exactly ill,' paraverbed Tom, who had not yet quite made up his mind as to what he should say.

'But I do not understand you. Tell me, please. What has happened to him?'

Mr Bilbury wondered what the end would be. He heartily wished that his wife would soothe him and settle the difficulty by throwing her arms round his neck.

'Nothing very serious,' he said. 'I dare say he has told you that he has become very fond of tiger shooting!'

'Ah, tiger!' Till me, Mr. Bilbury, tell me!'

Well, he went out tiger shooting one day as usual—ah—he was accompanied only by his servant. They entered the jungle. Suddenly, and without warning, a huge female tiger sprang upon your husband and bore him to the earth. The native fled for assistance, help arrived, and the victim was found faint from loss of blood, with his right arm torn out at the socket, his left eye destroyed, and the calf of his left leg—ah—deeply scored by the cruel claws of the ferocious monster!'

'Dear me, how alarming!' commented Mrs Bilbury, and the exclamations seemed so out of proportion to the gravity of the story, that Mr Bilbury felt a morally disappointed. 'But fully accounts,' continued Lydia, 'for his bad spirits. His right arm—'

'Yes, turn out at the socket, Mr. Bilbury. He has learned to write with his left hand.'

'Ah! dreadful! And his left eye destroyed?'

'Yes, he wears a glass eye, poor fellow!'

'It must be agony! And the calf of his leg deeply scored by the cruel claws of the ferocious monster! Terrible accidents! And when you left him, Mr. Bilbury, how was he? Will he survive?'

A new light seemed to break upon Mr Bilbury. But his wife was not to survive! He felt by no means sure of it.

'It is impossible to say with certainty,' he said, 'but you must hope for the best. Let me beg of you, my dear Mrs Bilbury, to keep up your spirits.'

'Oh, Mr. Bilbury, I don't see why I should be merciful. There is very pleasant society down here at Richmond, and, you know, there are as good fish in the sea as ever came out of it.'

Tom's worst misgivings were by this time more than confirmed. 'The heartless woman!' he thought. 'This is how she receives the news of my being mangled and disfigured! But still, unwilling to give up hope, he continued aloud: "Poor fellow! I assure you that in his delirium your name was very often on his lips!"'

'Indeed! Then he had not quite forgotten me.'

'Forgotten you?' repeated Tom, his feelings for an instant getting the better of him. 'O no! I think that it is the lot of but few women to have a husband so utterly devoted to her.'

'And of but few men to have a wife!—'

'So charming!' said Mr Bilbury, hushing the sentence.

'Oh, Mr. Bilbury!—But excuse me. Of course you will stay to luncheon. Do, to please me! You know that a woman hates solitude little less than snail-pot. One moment I will just go and give the necessary orders.' And Mrs Bilbury rose and quitted the room.

'Well, this is awful!' reflected her husband as soon as he was left alone. 'She doesn't recognize me, and apparently she doesn't want to care for me much. She reminds me that there are as good fish in the sea as ever came out of it. That, I suppose, means that if I would only die and

liberate her, she would promptly marry some one else. A nice instance of the faithfulness of women! Perhaps I should do well to leave her at once, and never let her know the truth, but I can't do that. I love her still, indeed, I'm afraid I love her more than I ever did. No, I will see this affair to the end. If she is unfaithful, I will find her out, and then—

His meditations were cut short by the return of his wife, who informed him that she had ordered some luncheon, and that he must remain while he waited. As it was, there was no one else in the house except the servants. This state of conversation made Tom more and more restless, and at once he lunched out into an account of an interesting moonlight picnic at Aden, where—so he let it appear—he had broken the hearts of several charming girls, and upon the whole had believed in a highly respectable manner.

'It must have been very delightful,' said Mrs. Bilbury. 'I wish I had been there.' Sometimes we have very pleasant evenings here. Of course, I know every one in the neighbourhood, and, as a married woman, I ask whom I like to my house. You must come one night, Mr. Tilbury, and sup with us often.

By this time Tom was perfectly frantic. 'I'm afraid I shan't be here for long,' he said bitterly. 'I am going abroad. I cannot stay here.'

'You are worried, I see,' said Mrs. Bilbury. 'I can sympathise with you.'

'Yes, family matters and disappointments, you know.'

'Disappointments! But you are young, and, if you will excuse me, not bad looking. Perhaps you have really let your heart to one of the young ladies at Aden.'

'O no,' he replied. 'And, to tell the truth, I am doubtful whether any woman would be worth worrying about.'

'Don't be cynical,' said Mrs. Bilbury with a smile. 'Perhaps you expect too much from women.'

'I expect sympathy, fidelity, and consideration,' answered Mr. Bilbury gravely.

'But let me ask you, do you yourself indulge in those virtues? Ah! men are very inconsistent, I fear. However, I hope that you do not believe that women are bad as a rule.'

'Well, I know to my cost that some are bad. Yes, some even betray their husbands.'

'And in such cases I'm afraid that the husbands are also to blame.'

'I don't think so,' said Tom curtly.

'But you are worrying yourself, I see, although you try to affect indifference. What is it?'

'Worrying myself? Not a bit!' said Mr. Bilbury.

'I am glad to hear you say so,' returned his wife. 'I don't worry myself. Cozy suppers and—'

'But the probable death of your husband!'

intercalated Mr. Bilbury.

'Oh, I am philosophical. We only lived together for two days, we only knew each other for a few weeks. What am I to him? What is he to me? Life is still before me.'

'That is rather plain speaking,' thought Tom. 'I wonder whether she would like to get up a flirtation with me. I will draw her on a little.'

'Ah!' he said aloud, 'you have happiness within your grasp, and you can make another happy. It is not every man who is so fortunate as to meet with a woman like you. Now, I confess that I have been unfortunate in my experience. But if I thought that I might hope for your sympathy!'

'Surely, Mr. Tilbury, it would be unwomanly of me to refuse it.'

Tom drew his chair nearer to that of his wife, and continued, 'Oh, if I might hope for your sympathy, and I look for your regard and pity, my dear Mrs. Bilbury, life, I assure you, would soon assume a new complexion to my eyes. Let us be plain. Can you not make me happy, and bestow your sympathy, your love, and your pity upon one who will value such gifts at their true worth?'

Mrs. Bilbury, smilingly assented, rose. 'Really,' she exclaimed, 'I was not prepared for all this. I feel the need of love, love such as yours, but—' And she buried her face in her hands.

Thus thought Mr. Bilbury to himself, 'is my faithful and devoted wife?' yet he was unable to refrain from casting himself beside Lydia and putting his arm round her waist. 'Dear Mrs. Bilbury,' he said, 'I love you! Do you, can you love me?'

She gave a scarcely perceptible gesture of assent, and Tom, now then highly convinced of his wife's untold worthiness, sprang up and confronted her.

'Mrs. Bilbury,' he said, 'what would your husband say to this? You have disgraced him!'

'He looked up, and held out her hands imploringly.'

'You are a virtuous woman!' he continued unrelentingly.

'Then why just now, did you ask for my love?'

she demanded. 'Because I wanted to assure myself that you were as virtuous and worthy as I now know you to be. As for loving you—I despise you! Ah! if you were only a good woman!' And he approached her and took her by the hand. For an instant he stood thus, then he raised the hand and kissed it, and finally he kissed his wife on the cheek.

'Are you going, Mr. Tilbury?' she asked.

'Yes, I had better go, it is for the best. We could not be happy. Good bye!' He kissed her again, and then moved slowly away to the door, where he stood, painfully regarding her.

'Good bye!' she echoed. 'But,' she continued in another voice, 'Tom!'

'Tom!' repeated Mr. Bilbury, staring and colouring. 'What told you my name was Tom?'

'You did, you foolish fellow, about two years ago.'

'And you knew me, Lydia?' he cried, as he quickly returned to her. 'You have known me all along!'

'No, I did not know you until you told me that tremendous story about the tiger. There was no mistaking you, then!'

By this time Mr. and Mrs. Thomas Bilbury were embracing each other so affectionately that the conversation was rendered very fragmentary and disjointed. It is therefore almost impossible

to chronicle what they said, but it is certain that they forgive each other, and it is a matter of notoriety that there has since been no happier couple on Richmond Hill.

# ON RESTRICTING THE OUTPUT OF COAL.

A few years ago, the coal industries of this country were in a state of unprecedented prosperity, employer and employee receiving the highest remuneration ever known. A variety of causes, however, brought about a decline, and this decline continued until at last the coal industries and the wages paid to coal employees sunk to their former condition. During the continuance of the 'good times' neither the miners' leaders nor the miners themselves gave a due amount of thought to the cause of the prosperity they enjoyed. But when the decline came, and they found themselves enjoying grand wages no longer, they began to inquire into the cause of the decline. This was easily found. The remuneration obtained by mine and mine owner is the cause of prosperity shared as a lure to other labourers and capitalists, one class going into the mines, the other becoming mine owners. This influx of capital and labour into the coal industries greatly augmented the output of coal, so that the supply exceeded the demand, when, of course, prices fell, and coal was undervalued, and, as a result, was the competition in the market.

As a result of this inquiry into the cause of the decline in miners' wages, we have the theory of restriction, and without doubt the general body of the coal miners of the United Kingdom believe that by restricting the output of coal they will be able to bring back the 'golden age' of mining. Meetings representative of almost all the colliers in the three countries have been held at Manchester, at Leeds, and at various other places, and resolutions in favour of restriction were unanimously carried. So implicit is the belief in restriction, that the man who dares to question its worth is looked upon by his fellow miners just as a man would be regarded who denied the attraction of gravitation. As a miner, the writer can speak from experience when he remarks his readers that almost all miners regard restriction as a self-evident truth.

The believers in restriction uphold their theory thus: 'The price of every commodity, they say, is governed by the laws of supply and demand. If the supply exceeds the demand, prices have a tendency to fall, and inversely, if the demand exceeds the supply, prices have a tendency to rise. These are natural laws, their truth is undeniable, and the inference we draw from them is clear. We purpose restricting the output of coal till the demand exceeds the supply, when, of course, prices will rise, and our employers receiving better prices for their coals, will be able to give us better wages.' Such is the reasoning on which is built the theory of restriction, and to a limited extent, it is sound. But in order to perceive the shortcomings of this theory, it becomes necessary to follow restriction to its logical consequences.

—a thing restrictionists are not always disposed to do.

In order to test restriction fairly, we will assume that the miners of Great Britain unanimously agree to restrict the output of coal in the most approved fashion, namely, that of working five days a week and eight hours a day. A restriction of this kind would certainly be thorough, for, whereas the colliers formerly worked from fifty hours to sixty-five hours per week, they would enter the new system working only forty, and the change would entail in the hours of labour a reduction of about twenty-five per cent. Under this system of restriction, the colliers would work three-fourths of the time they formerly worked, they would produce three-fourths of the coal they formerly produced, and finally, they would receive three-fourths of the wages they had received previously. The first phase of restriction presents a far from pleasant aspect to the collier. In order to obtain good wages at some unknown future time, he voluntarily reduces his present earnings to the extent of twenty-five per cent, in the hopes of enjoying a future good time, he makes of the present a bad time. The colliers who formerly earned on an average thirty shillings a week, would under the new system earn seven shillings and sixpence a week less, and as it would take, say, three months for the decrease in the output to affect the market, the loss to each collier would be considerable.

'But what of that?' restrictionists will exclaim. 'The increased wages we should then receive would more than redeem our losses.'

We think this would not be the case, and hope to show its improbability. We will suppose that restriction has been in existence for just a year. As it would take, say, three months of restriction to affect the coal market, the first quarter of the year would entail on each collier a loss of one-fourth of his former earnings. At the beginning of the fourth month, however, the supply falls beneath the demand, prices rise, and the colliers get an advance of ten per cent. Two months after, they get another advance of ten per cent, and two months after that, they get a similar advance, and so keep advancing every two months of the year. Would all the advances received—fifty per cent—recoup the voluntary losses of the collier during the first half year of restriction? No! At the end of the first year of restriction, every collier whose wages had formerly averaged thirty shillings a week would have lost more than ten pounds sterling, and this notwithstanding the fact that his wages had advanced fifty per cent.

And here other considerations arise. To what an enormous price coal would rise during the restrictive year, and what an ill effect this augmentation of price must have had on other industries. All the varied industries of our land are linked indissolubly together. One industry cannot be tampered with without disturbing its fellows, and thus great advance in the price of our staple food would have a tendency to increase the productive cost of many thousands of commodities, for which the collier would have to pay an increased price. Take, as an instance, the iron industries, where hundreds of thousands of tons of coal are used annually for smelting

and other purposes, and it needs no philosopher might to perceive that the price of the coal influences the price of the finished product. It is impossible in an article like the present to do more than touch the fringe of the subject, and we return ■ that part of it which most intimately concerns the collier.

'But,' says the restrictionist, 'though the colliers may not reap themselves in the first year of restriction, they will do so in the second year. The great wages they would get in the second year would more than compensate them for the first year's losses.'

Yes, we reply, if all went on as smoothly as you imagine. But your restriction would kill itself, and just at the time of its fruition. How would you find yourselves at the end of the first year? Probably enjoying short hours and low wages, and what would ensue? Why, the very causes which came into operation a few years ago, would come again into active existence. Your short hours and splendid wages would lure thousands to the mines. The reform of every other vocation would be unable for places in your pits, and new pits and new pitmen would spring as quickly as mushrooms into existence, just as they did half a score of years ago. There are no gates to the mines to exclude new comers, no law ■ prevent the working of new mines, and whenever mining and mine-owning become highly profitable, miners and mine owners will bustle into them. And when this influx of labour and capital occurs, restriction vanishes into thin air. The new comers help to swell the markets, the supply exceeds the demand, competition sets in prices fall, and soon the old order of things would prevail.

#### THE POTATO DISEASE

A very moderate calculation puts down the loss caused to the country by the potato disease at a million pounds a year. It is doubtless much more than this. Indeed, the loss in Ireland alone in the exceptionally bad year of 1879 was put down at eight million pounds. So long as the disease remains unconquered, the loss will continue. But the dawn is breaking. Hitherto efforts have been made to fight the disease. Now we are beginning to learn to avoid it. In 1860, to supply our wants, we had to export potatoes valued at two million eight hundred and forty-seven thousand and twenty-seven pounds. In 1881, on the other hand, we not only had enough for ourselves, but we exported large quantities to America and Ireland. How did this come about? Simply that farmers planted vigorous bonnies and bitches champions kindly that, because of their strong constitution, are not only good at croppers, but in a great degree disease-resistant. Strength of constitution is what is wanted in order to combat the potato disease. For this reason, we are glad to see that the Highland and Agricultural Society have agreed to offer prizes for new potatoes of real merit. There can be no doubt that, so far, agriculturists are travelling in the right direction, and it is to be hoped that what has been done for potatoes may be done for every kind of farm-crop. Already, farmers have begun to reap the benefit, and instances are not wanting of profit of from thirty to even ninety pounds an

acre being gained by growing proper kinds of potatoes and securing the market at the proper time. Some account of the above facts may be seen, with the details, in a pamphlet issued by Messrs. Sutton and Son of Reading, Berks, which may be had for a stamp by any applicant. ■ will worth the attention of farmers and market gardeners.

#### IN MEMORIAM

▷ X

Bereft, ye spheres! ring out my mournful tale  
And oh ye groves your solemn music lend  
To my great grief, in plaintive, sorrowing wail,  
I've been so dead, my Husband and my Friend!

And oh then I we, the vessel of my youth,  
Now lend thy strength to carry note of woe,  
While I in sorrow learn the bitter truth—  
The lonely hours that widowed heart must know

O Love, O Sorrow, wherefore are ye twin,  
The cruel base of my benighted life?  
Where to encounter sorrow ye return  
I seek strengthening rock in anguish and in grief!

The tones of throes which I was wont to hear,  
And bear with rapture from his blessed lips  
Are a lost now! Where shall I find him past?  
Is me the world is shrouded in eclipse!

For dark are all the scenes where he is not  
And none we all the sounds without his voice,  
For thus I see my sweet better lot  
Though the rain would should cry, Joyon 4, 1880!

But he has passed to purer Light above,  
And so I hold it can thus to console,  
With me be left a gem it undying love,  
And nothing but the holier thought remains

There will I cherish till the Brial Song  
Of the Eternal Kingdom shall unite  
My soul with his in I with the glorious Throng,  
Fast by the throne of Majesty and Light!

There shall the voice which bade the lillows cease  
Their tumult on the lake of Gilt  
Be heard in the thrilling tones of Love and Peace—  
Of Love so full of joy and harmony!

The Contributors of CHAMBERS'S JOURNAL beg to direct the attention of CONTRIBUTORS to the following notices:  
1st All communications should be addressed to the Editor, 339 High Street, Edinburgh.

2d To insure return in case of ineligibility, postage stamps should accompany every manuscript.

3d Manuscripts should bear the author's full Christian name, surname and Address, legibly written and should be written on white (not blue) paper, and on one side of the leaf only.

4th Offerings of Verse should invariably be accompanied by a stamped and a ruled envelope.

Unless Contributors comply with the above rules, the Editor cannot undertake to return copyright papers.

## THE STRANGE STORY OF A WOOD PIGEON

THE following appears to be an almost unparalleled instance of chosen domestication and personal attachment on the part of one of the shyest of wild birds, the wood pigeon.

A friend of mine in one of the northern counties of Scotland (says our correspondent), lives in a cottage in the heart of a wood, and is employed on an estate as forester, gamekeeper, and land steward. His name and address are as follows: Mr Peter Wright, Burn Cottage, Bourne, by Old Meldrum, Aberdeenshire. (The proprietor of the estate is Major Bunney of Stalock and Barra.) Mr Wright, who is unmarried, had resided there for a good many years with his aged mother, whose decease he had recently cause to deplore. One oppressively hot day I had called to see him, and while sitting together engaged in conversation, the door being ajar, there came walking in with the greatest deliberation, and full in view of us, a stranger pigeon. (It may here be remarked in passing that there were no tame pigeons kept about the place.) Having entered, the pigeon came right forward without any seeming fear, hesitancy, or halting, into the room, and stood respectfully before us. My friend remarked, 'There's a doc [pigeon]! I wonder where it's come from.' At first, it was supposed that the stranger was probably some neighbouring tame pigeon that had stumbled in, and through intuition, we did not at that time observe that it was really a cushat dove or wood pigeon. Finding itself unchecked and not ill received, it marched forward past us and through the room to a bedroom at the back, into which it coolly walked, as if to say 'Here I mean to stay.' My friend followed and held out his hand towards it, uttering familiar words in winning tones. The pigeon at once, without any sign of fear, put its head into his hand, moving its wings and clucking contentedly, as a young pigeon does in pressing on the parent bird to be fed. A few crumbs of bread were

placed before it, some of which it ate readily, but not by any means in a ravenous manner, and indeed it did not seem as if famished. Although evidently a young bird, the pigeon was far enough grown to be quite fit to provide for itself, more especially at that time of the year. The tail, however, was an injury, having seemingly been pulled out by a cat, or perhaps by a hawk. Yet it did not appear as if it had been pursued and forced to seek shelter and safety from an enemy.

The pigeon continued to stay on, but on account of his domestic behaviour, the gamekeeper almost forgot about it, and no pains were taken to tame or familiarise the strange visitor with its new chosen companions or its new abode. The woman who kept house for the gamekeeper merely gave it food, and it at once made itself at home, and at night lodged in my friend's bedroom, perching itself unbidden on a clothes peg. For a while it moved about very quietly, but by and by it would, in the early morning, fly from its perch on to the bed. At other times it would follow the gamekeeper, and seem dejected when he was out of sight. After a while, he began to observe its movements more particularly, and its peculiar attachment, and speedily a strong regard arose between man and bird.

It has now (March) been nearly seven months in the house, and its devotedness to its master is amazing. It would follow him wherever he goes, was it not restrained, and lest it should be taken in any of the rabbit traps, it has to be shut in when he leaves the house, to go through the woods and ground. When at any safe work, it is permitted to go with him, and from morn till night it will stay close beside him watching his proceedings, accompanying him to meals, and returning again when he resumes work. It is very tame, and also somewhat amusing, to observe its diligent labour. For example, one day he was trimming the borders of a long wall, and all the time he was cutting the edges of the grassy sward, the pigeon kept time, pecking the edge close to his feet, as if determinedly assisting in the work. When

any one came near to speak with its master, it would withdraw to a distance, and when the stranger went away, it would then at once return and resume its occupation. At meals it takes its place on a chair close by him, where it has its dish of food and its can of water, and will remain there just till he moves, when it promptly goes with him, if allowed. Sometimes, when it has fed, it will perch itself on the back of his chair, or on his shoulder, upon the slightest token of indulgence or permission, as on his head or hand, and nibble around his eyes, or over his hair, neck, beard, and face, in the most loving-like manner, and when you are conversing, it will look archly and knowingly, holding its head to one side, and moving its bill with a light crutching like sound in opinion, and shutting, as if in attempt to speak or imitation of the movement of his lips in return. Indeed, so intelligent a creature is it, that one can secure help from it, that it is not only listening parrot-like and unblinking standing while it waits, but also labouring to acquire the faculty of using human language, so as to be able to reply.

To prove the intense personal devotion of this stranger from the woods, one striking instance may be given. Some weeks after its appearance, its master had to be away on business for three days. It was painful to see its increasing restlessness and evident distress at his protracted absence, and painful to note its delight when he at last returned. But that was not all. It seemed to have fully resolved not to leave him again, and next day, when he set out to go through the woods, it determinedly followed, and would not be hindered. Its power of keeping in view and not losing him being slight, and not seeing it he at last lost him in the thickets, and could not find him again. Like some wiser birds in such circumstances it seems to have concluded that he, not it, was lost, and consequently it must have continued its fruitless search till night fell, when it had to lodge in the wood. Next morning it probably resumed its search, for only at mid-day did it appear to have been struck with the thought, that possibly its master had got home without it. On reaching the cottage, the delight of the bird was cordially reciprocated by its protector.

Whenever it is detained at home, if not allowed to accompany him, the pigeon will remain pretty much about the house, and a good deal restless. Sometimes it will go through the woods on an exploring tour, or for exercise, and return way for several hours together, but always willingly returns. Mostly, however, when the keeper is absent, it will go out and in and around among the outhouses, occasionally perching itself on the top of a building, and sit as if dozing. When he appears, at a word it will open its eyes, pick itself up, and fly to him. If he says coaxingly 'I am going to dinner, come—do you come?' it will

light on his shoulder or head, and, thus carried, enter with him, and take its accustomed place. When he is present, it cares for no other. Still, when he is away for only the usual short intervals, it is quite at ease with the housekeeper, and will sit there, as if in frolic, fly on to her head or back when at work. It will sit about on tables, chairs, window sills, take a look into the mirror, lift a comb or other small article, and make itself as it were generally useful. The cat and it are quite safe and easy friends, but without much familiarity on either part. It dislikes, however, the presence of a dog. It seems also to have a strong antipathy to blue, which it shows if an article of that colour is held before it. It is quite familiar with me, and always seems pleased to see me. The second time I saw it, a short while after the day it arrived, it appeared at once to look at me knowingly, as if to say 'O yes, I have seen you before. I know you as a friend of my friend, and you were here when I came. You are welcome, and I shall always be glad to see you.' It allows me the fullest liberty with it, and it will readily come upon my hand or finger, and permit me to carry it about anywhere, out or in, around the house in broad day, without seeking to fly off, and if I place it on anything outside, leave it, and I go into the house, it will speedily come flying in after me.

One day that I called, it was abroad on a visit through the wood, but very soon it came in and lighted on the table near me. I began to talk to it, and take it on my finger, placing it near my face, when, instead of being frightened or shrinking from me, it began to peck gently and curiously around my eye, beard, head, and neck. But although so familiar and seemingly pleased with my presence, it never fails to follow me when I leave the house, as it does my friend. He is clearly the one supreme object of its attachment and solicitude. As his visit is limited to it to that of no cat, but it permits meanness and familiarity only to a dog, and at times shows hearty displeasure. It is not only his peculiar and strong liking, but it has manifested somewhat more individual dislike, in one instance, at least, thinking so. A nephew of my friend had found it impossible to be present from a distance at a near relative's funeral, and made a visit a short time after. When seated in the house, the pigeon approached, and set upon him with bill and wings more in manner of a hawk circle than a gentle dove, and as if determined to drive him from the house. Usually, however, if it shows no special liking, it is quite indifferent, unless when too closely approached and liberties taken with it, when it will vigorously defend itself, pecking and striking furiously with its wings. If teased by its accepted friends, it will peck more or less severely, but rather in a playful manner than otherwise.

In coming, and at such a time, and its peculiar ways and habits, are wholly uncalculable upon any material or recognized principles, and it can scarcely be wondered if my friend should not only have an affectionate regard, but something like a reverential love for it, and without any undue superstitious notions, one could hardly be blamed for conceiving that there must be something supernatural about its visit and manners, nor

should it be thought especially odd, or very improper, if neighbours do, as if with bated breath, whisper 'It looks just as if it had been sent.'

It has now become a very plump and pretty bird indeed—a most perfect and beautiful specimen both in figure and feather. One of its chief delights is to wash itself, and it seems to take pleasure in occasionally dabbling in water. If a tub well filled should be at hand, it will at least once a day get into it, swim and paddle about, and dive overhead like a duck, and all the more will be its evident satisfaction if it can have a shower bath. At the same time by run running from the house upon and over the brick. When satisfied with its bath, it will, if the day is cold, go inside, and place itself near the fire, and commence to preen its feathers in the manner common to fowls. Indeed, its frolics, and its familiarity and intelligence, seem to be of a far higher order than those of any other bird with which I am acquainted.

It has repeatedly been suggested that this intelligent pigeon may not be tamed, and come from somewhere not far away. Well, supposing it were so, it would still remain an unaccountable how it should have of free choice so decidedly taken up its abode in a strange habitation, and attached itself so persistently to a particular individual. But no information of a tame wood pigeon near or far can be found. No doubt wood pigeons may be tamed, though I cannot from my own experience speak to the fact as being of common occurrence. There is no evidence that the pigeon in question had been previously tamed, and if that were proof, it could never satisfactorily explain so sudden and intense an attachment. A stranger. Neither is it of importance to try fully to account for the fact by supposing that the pigeon had been driven by flight to seek shelter. There is no evidence that it was so, and the deliberate manner in which it presented itself gave no appearance of any such fact. Besides, had it been so it would muse then probably have gone away after a while, when the flight was over, and if the terror should have remained, it would not readily wander abroad through the woodlands, its natural haunt, as it has been in the habit of doing, alone and unconstrained. Neither, had it been driven in for shelter and protection, could such a fact account at all for the peculiar personal attachment so immediately manifested and maintained. A trustee too—the natural enemy of its manly tribe—was surely not the most likely partner to be sought, unless, indeed, considerable reasoning power could be predicated of the bird, reckoning on the principle that its most dangerous enemy, should it grow his frown, would prove its best protector. Nor will the theory of ostracism fit much better than that of fear. Besides being considerably improbable that so young a bird should have been shunned by its kind, the fact of its going so readily abroad and staying for hours together in its natural haunts, would militate against the likelihood of such a supposition as ostracism. By no reasoning and on no natural principle does it seem that a satisfactory theory can be advanced. This attachment is so extraordinary in all particulars, that

nothing equal or akin to it, my knowledge, be produced with regard to any wild animal, and all the less to one of a species naturally so shy of man.

## ONE ALSO, BOTH FAIR;

OR, A HARD LOT

CHAPTER XVII.—CRIMINALS.

A DARK night on the river. It was summer; but there was a raw damp chill in the moist air. The day had been fine, but now a high wind had set in from the seaward, chasing a noisier splash and splash than usual from the rising tide, that swirled about the quays, and tested the moorings of the many barges and boats, as if at anchor there, above land, on the London Thames, that is so different from the silver Thames beloved of swans, some score or two of miles away. There was no moon, and a little of rain kept falling from the murky sky. It was not in morning, evening, nor was the up—a dull little white, at the foot of one of the so dabling streets that run steeply down from the Strand to the river—a tempting one. Yet in the dark, a little, as if on a sturdy stump of natural timber—it had been a fragment of a tree, possibly, to which, when convenient, chairs or tables were made fast—was a well dressed man, surveying the black stream and the dim outlines of the neighbouring buildings, as contented as though he had been home, at the lowliest prospect in the world.

It has been said that the man was well dressed. So he was, in the sense that his clothes, of shiny black broadcloth and fine texture, were new and good. They hung loosely on him, though, as if ready made. The hat was new and glossy, too, and so was the silk neck scarf with its glittering pattern, and so were the boots, well blacked and bright. There were no jewels on the lean brown hands, but a watch chain, fastened on the long fob, and which had that peculiar pliancy that we habitually associate with the hands of a sailor. And indeed, the man's apparel might very well have been, in its last rugged freshness, the shirt, going attire of some officer of the merchant service, a man whose dandy in his way. There he sat, and there he smoked, an ugly snail, meantime, looking about the corners of a mouth that was by itself anything but impulsive to look upon. A fine looking man enough, tall, thin, dark-skinned, broad across the chest, exactly the sort of recruit that in the army they call a 'first class man', man, and whom judicious colonels put in the front rank. He was not young—in the prime of life, perhaps—for there was a little silver mingling with the dark Auburn of the hair and beard, while the face, handsome so far as features went, was tanned to a swarthy brownness by the tropic sun, and marked by innumerable wrinkles, as fine as if their delicate lines had been traced by the point of a needle. The eyes of themselves would have attracted notice anywhere, so bright were they, and yet so chameleon like in colour and expression. It could have been no common character to whom those restless eyes belonged.

There he sat, alone, listening to the melancholy sound of the last rising tide, and the barking of dogs on board of vessels far away, and the distant

roof of the great thoroughfare at the other end of the steep and narrow street that descended upon the wharf.

'A cheerful look thou,' he muttered to himself, from beneath his bushy beard—'a cheerful look for a philosopher to choose for the scene of his meditations. I've known wise, though,' he added, with a sort of chuckle, done, probably, to some reminiscence that suddenly occurred to him—'very much wiser. Pussanata Point is not an earthly Eden, nor is the penon of the Brand of Panishments in Pekin exactly an abode of bliss. Pity, that Dank before he wrote his *Infra*, could not have known about the world as I have done, and seen some of the sights that I have seen—such as Old Li-huen, could not show the poet.'

The speaker's reflection was perfect and his voice a good one, but there was something in the peculiar ring of it that would have jarred upon the ear of a listener, something cynical, but, and cold. For a while he smoked on in silence, and then, with a sort of involuntary shudder, turned away the tail of his cigarette and watched the little fiery spark as it floated for a moment in the black water below the wharf's edge, and then went out.

'It's chilly here, he muttered. 'Fa-hun! gives but cold comfort, is usual, to the prodigal turned from summer climates. And yet—ah! yet, there is more to be picked up under this foggy sky, than anywhere I know of from Asia to Austral. Will the great power in the lottery turn up for me this time? Darn! Darn! certainly (wasn't a successful spin of her ladyship's roulette wheel by now, for the world has dealt her badly of late years with Chinese silk. But when she was on a South Sea island, bonneted to a Chinese gambling house, captain of an Arab slave dhows, that the boats of Her Majesty's ship *Indra*, captured in the Red Sea. Lucky for me that I was able to play as well as to draw the character! Little did Her Majesty's officers—how well I remember them in the gold-headed cups, on the main of was a quarter deck, as I used my shabby hands and made my respectful salutes—little did those navy lads think that I, the prisoner, the Arab slave dog, understood every word they said as well as they did themselves.' 'Not half bad!—wasn't it? It was a lieutenant who said so, and then the prisoner added, "That's right, you know." Will read young fellow, that prisoner! He knew all about us Moslems, didn't he? Am I a Moslem, by the way, or am I Confucius that I stand by?—as when I was his secretary to that poor fellow Kung-Yee, the mandarin. At any rate, the British naval officers never dreamed that Ali Hassan, the turbulent skipper of the dhow they caught at anchor, with a cargo of live ebony on board, was John, only son of the Reverend!—Here an expression of genuine pain came across his reckless face, and he sprang up from his seat with a waked look in his flashing eyes, as though his conscience pricked him, and he would have been thankful for some scapegoat for his anger. A moment afterwards, and he was able to laugh at his own emotion. 'I really thought,' he said cheerily, 'that I saw the old place again—the pomegranate gate, my sisters, poor girls, coming home from church in their spruce Sunday frocks, my father,

worthier man, with rebuke in his eyes, because I had killed away the time that night, he have been spent in hankering to the armen it had cost him many a painful hour to prepare, the blue mountains—Alps as I thought them then, mole hills as I know them now to be, since these eyes have looked on Andes and Himalaya—in the back ground, and in front, the walls of my land, Castel Vaux. Yes, it is very real and very rich, is Castel Vaux.'

He laughed heartily, and then, quitting the wharf, ascended the steep little street, at the upper end of which, full of bustle and activity, was the busy strand, while below, in, black and swift and silent, the great river, without which London would never have been the London that we know. In the middle of Jane Seymour Street—all these parallel alleys seem to bear the names of those whom our crowned rulers, King Henry, and the Black—was an odd little private hotel, which took, through the medium of fly hives in *Bed and Breakfast*, and of silver treatments in its country newspapers, a connection with the common public that it is very difficult to find place of entertainment is known as *Bed and Breakfast*. It is, strictly speaking, and has been within the memory of man, *Mrs. Hodgson's Hotel*. This may have been a Bulger's of the middle, but he must have died very long ago, since the oldest frequenter of the Jane Seymour Street hostelry remembers this pretentious black bount with the artificial flowers. In this private hotel, is dining room, and such a din as can well be matched in London, the soloiquet of the wharf is evidently a valued guest.

'Any letters for the Captain, B b?' called out Mr. Bulger to the party faced wharf, in response to the inquiry of his newly returned inmate.

'No, main, and B b, as his unwholesome complexion and the duty maphin twisted round his professed thumb, in his visible in the doorway of the comfortable dining room, "nothing."

But Bob the waiter ducked his head respect fully, as 'the Captains' busy eye encountered the polished optics of his. Manifestly, the broadest guest was not known under that roof by the queer name. 'Chinese Jack, and manifestly, too, he was considered as a solvent and a liberal customer, worthy of lip loyalty and of attention. Miss Bulger of Jane Seymour Street had the oldest clients out of elbows clergy men, with various eyed wives, many numbers of strange little sects, from Wales or Cornwall, he knew better in flapping coats, and whose women he caught all London from the platform was only equalled by their self-denying thirst, and northern farmers and rough mining men, and unlearned persons from the other side of the world, who did not even exactly have made the fortune that they sought, either by wool or gold. All these varying clients had one point in common—an inveterate dislike to putting, except upon compulsion, with a stray sixpence or an extra shilling, a quality more hateful than any other in the eyes of a struggling milkmaid. Now the Captain was, according to Jane Seymour Street ideas, pretty much what a Russian Prince or an American Silver King appears to the managers of the *Grand Hotel* in Paris.

'Never mind—Nice evening, Mrs. Bulger,' and the Captain gracefully, as he leaned his elbow

on the low narrow counter that crossed the half-door of the frowny bar.

Mrs. Badgers coughed behind her black worsted mittens. She was used to her tut complaints from curly men and discomfited women, from the country, of the damp, the darkness, the gloom, and uninviting aspect of Jan. Seymour Street. She was unused to praise of any sort, and with reluctance even to so humble a subject as the weather, and she almost feared that her customer's eulogistic words might veil a sarcasm. It was a nasty night, but then it was just possible that the Captain, freshly returned from abroad, as she knew, might have come from foreign parts where the nights were nastier, and might regard that chimney-cleaning in the Strand parlour as some thing cheerful and exhilarating.

'We must take 'em as they come,' was the landlady's hesitating answer, 'and what I always do say is, that with water above and water below, and so central the situation as the healthiest in London!' There may have been a punning in the reasoning, but Mrs. Badgers had made the statement a few times before, and believed in the truth of what she said, as we all get to believe in the truth of what we habitually say.

'I should judge so by your looks, Mrs. Badgers,' returned the guest, smiling but archly—'I should judge that Captain—' and as a woman is never too old for a compliment, Mrs. Badgers smiled, and blushed a dusky crimson through her nose.

'Won't you take something, sir, before you go up stairs?' asked the smiling landlady, motioning with her black worsted mittens to a shelf stocked with invidious bottles, pointed all over with golden grapes, but the contents of which probably owed less to the grape than to grain and potatoes.

The Captain would take something. He turned off the glassful of liquid fire that Mrs. Badgers poured for him, politely performing the duty with 'Your health, ma'am,' and then, with a nod, bowed on, up the dark and irregular stairs, and reached his room.

The Captain's private sitting-room was on the first floor, and the Captain's bedchamber adjoined it. Both were low-ceiled, and remarkably dingy in the furniture and general appointments. But the gas in the first-mentioned apartment was blazing brightly, and gave an air of almost cheerfulness and almost comfort to the shabby surroundings. The Captain unlocked a neat little writing-case of shiny yellow leather—all his luggage, as might be seen by peeping through the door, now ajar, of his bed-room, was neat and ostentatiously new, like his wearing apparel—and took from an inner compartment a smoking tobacco pouch, a small brass-mounted horn such as Moors use for carriages of the fine gipsies that they still employ for plying, a very little horn spoon, and a bundle of empty cigarette papers. Clearly, the Captain preferred making up the cigarettes for his own consumption, to buying them, as less careful smokers do, ready-made. Very dexterously and quickly he mingled the fragrant light-lined tobacco from the pouch with a grey, pungent molasses, sticky drug, which, by the aid of the tiny spoon, he extracted from the horn, rolled up with practised fingers some dozen or so of the cigarettes, and handling one of them, sat down in the biggest and comiest of the arm

chairs, and with his head thrown back, smoked for a while silently, and with an air of dreamy enjoyment, such as a punther might have shown when taking on a sunny bank in some inaccessible forest of the Tiers.

Next, it might easily have been said, had no unsuspecting customer darkened the doors of Mrs. Badgers's house of public entertainment, parlours which nevertheless had opened in their time to give admission to odd samples of humanity. This man was a living enigma. Unscrupulous, disgusting, artful as he evidently was, he had yet returned, through who knew what experiences, a certain charm of manner, which was never found except among the educated. He suited him just then to play the modern merchant-captain returned from a prosperous voyage, and probably he could have sustained the part with perfect ease even at that time honoured shippers' house of call, the *Terminus*, after hours. The odd sales of a rougher school who frequented the place might have growled at him as a Jimmy Jeramy and a dandy, but they would have credited him with being resourceful enough to fight his way manfully through white squall or typhoon. Had he chosen to act the soldier, or the commercial traveller, or the thoughtful artisan of superior attainment, or the most difficult character of all to assume—to pose as a gentleman of refined manners and cultivated mind, he would have acquitted himself equally well. And yet in every one of these parts there would have been a lurking glitter in his keen eye, a mocking ring in his not unamiable voice, to cry, *Be ware!*

He smoked the first three of his mandated cigarettes in silence, and then, in a low but distinct tone, resumed the self-communings which had been interrupted when he left the wharf. 'An odd trick, this of mine, of talking to myself,' he muttered, 'but it has served to prevent my tongue from growing rusty, it, and my English from slipping in the articulation, and I bring me with nothing but a sort of queer dialect jumbled together in my memory. Welsh, perhaps, might have stuck to me longer. It was in Welsh, I'm sure, that I crawled abroad for help, when that rascally Dyak sea robber, my master, had burnt me, his Christian runaway slave, neck deep in the molasses in the beach, and, as good luck would have it, the war fleet of the opposition privateers landed their cut throats just in time to prevent the ants from picking my bones as white as ivory. I have brushed through, by the skin of my teeth, as our Yankee cousins say, pretty often for one man,' he added boastfully, and yet with a sort of sadness in his tone.

He lit a fresh cigarette, and then went on, dreamily, but yet in a voice that to one of the old aristocratic saloons of the Faubourg, St. Germain would have been heard to with respect, as having the old aristocratic ring, so sweet, so true, so confident, in the modulations of a life spanning. 'I am set wide—I am sure I am,' he said, between the puffs of the slender cigarette, 'for a purpose. I must do something, I am certain, worth the doing, before I lose the number of my men. Well, well, we can of mine lives—must should be of ninety—and now—when I reckon Negroes and Chinese, Malays and Turks and Milaneseans, as among those who wanted, not to "watch over the life

of poor Jack,' but to shorten it with crooked sword and spear and war club, and person—ought to accomplish something, on this side the grave. We live—so the proverb says—three churches. Perhaps my greatest chance was when I was King. Two chairs a cartage, he was a man, a lump of flesh and silk, with the red coral Viceroy's button on his black cap—and all the dollars and cash stuns, in which burn the jewels, the silk, the tea, of the finished taxpayers of the province running into the viceregal palace as fast as lichen petals and hurrying balloons, could bring them. How could I tell that our province—*cur*—was selected for the total conquest, that the golden spring was to be wrong dry for the benefit of the Italian Treasury, that the Europeans would wanted a new mobile palace and garden and suburbs, out of the spoils of his discord? In silence, my master, whom they—Did they strangle him? or was it more transportation to him? At any rate, they took away all my board—I had substituted my master—there were rubies and pearls, as well as the heavy gold and silver, but the Chinese know how to search. I was a beggar when I worked my passage from Macao to Hongkong, but then I was young and strong and had the world before me.

'My English captors the other day,' he resumed after a few more whiffs, 'were very gentle with the poor misguided Moslem who bought cheap blacks in Africa and sold them dear in Arabia and Persia. They never thought of looking in my coarse cotton cummerbund, where Ali Hivan had stowed in the good heavy ounces of gold dust, bought with negro flesh and elephant tusks, and a slight sometimes, among the baobab trees of Africa. They actually unlocked a few shillings' space to send the Arab captain—and he was so respectable a Mussulman, five times a day ready with the basin and the praying carpet—from Suva to Omo and Alexandria. Then it came about that the *captain*—the Indian boatman—of the *Cypria* should be him and she, and I, who can picture Himmlani as a dead fish monk his invocations, should be chosen to fill his place, as Ali Hivan, always. Even the Indian lazar fellows called me Halil Ali Hivan, and thought me a sort of suffering saint. And then those two lovely creatures came on board, and I heard the old name and sat on the heels of the luggage, and remembered Castel Vanzo and the Wulsh hills, and soon learned from the gabble of the prating passenger, who derided the lazar boatman and nobody, the story of the widowhood and of the rich inheritance.

'And then I saw her. I saw her, again and again, and though she lit the eyes of a lynx and the cunning of a demon, she never saw me, or realised, if she did see me, under the shelter of my beard, my turban, and my tanned face, that I was—Ah, well! She, of all women, to be there. Not for nothing, I know, when I saw her hovering about those gulls like an eagle round a dove's nest. She was on the scent of prey. Of course she won. She always wins. But little did she dream, that wet, wild morning after the storm, that somebody—somebody whose bare feet made no sound upon the deck—listened behind the boat, and understood—what no Mohammedan could have gathered, from the

talk—Ah, well,' said the Captain sleepily, 'it seems to me as if a fortune ought—but I think I can spend her little game—and then he ceased speaking, and presently went to bed and slept soundly.

(To be continued.)

## THE RECLAMATION OF THE ITALIAN MARSHES

A PROPOSAL has been laid before the Italian government by Signor Torricelli which deals with the above subject, and with others which at first sight have no apparent connection with it, but which in reality it much affects. The proposition questions the utility of the productiveness of railway property, and, if it would seem, in a close manner with the subject of the real location of the marshes than might be looked for.

Previous to the year 1860, the *malaria*, or pestilential disease caused by the exhalations of the marshes, was confined to certain districts, such as the Tuscan Marshes, the Roman Campagna, the Pontine Marshes, Calabria, &c. The clearing away of large tracts of forest and other causes have tended, since the unification of Italy, to extend the noxious influence of the *aria cattiva*. Out of about five thousand miles of railway in Italy some time ago, it was calculated that about two thousand three hundred and fifty miles were within the area known as being subject to *malaria*. On these portions of the railway system, night service is often impossible, as the officials have to be conveyed at sunset to a spot not subject to the fatal exhalations, and high wages have to be paid to such men as risk the danger in ideal to the carrying out of this daily risk. A recent investigation made by order of the government showed that out of the sixty-nine provinces of Italy, only six are free from traces of *malaria*, and that fifteen out of a score are not rendered uninhabitable from this cause. The important nature of the question at issue may likewise be estimated from the fact, that, according to statements recently published, there are every year, on an average, seven hundred thousand cases of malarial fever amongst the soldiers of the Italian army.

Simultaneously with the spread of malarial disease there has been, within the last twenty years, a marked increase of emigration, more particularly amongst the peasantry, who are referred to the crises already indicated. There has been also a gradually increasing burden for the state in the shape of the subsidies which the railway Companies are in many cases obliged to receive from the government in order to carry on the traffic. The most unproductive portion of the Italian railway system is that which runs through the district anciently known as *Magna Græcia*, where at one time a number of populous and wealthy republics flourished, but which now marshy plains form a dead land. The cost of working some portions of the Italian lines is fifty per cent more than the gross revenue, as a normal proportion, but elemental disturbances sometimes render the disparity between the gross earnings and the cost of the service to be in the proportion of one hundred to two hundred and fifty-two. The sum which the Italian legislature has to contribute to the working expenses of the

national railway system is calculated—according to the Roman correspondent of the *Odegon Gazette*—to amount to two hundred and twenty thousand pounds sterling.

Signor Torelli does not propose to discontinue financial help on the part of the state. His plans are in part suggested by the fact that manual labour is required for the reclamation of the marshes, while residence on some of these reclaimed localities is usually fatal to life. He therefore proposes that the labourers employed in the work of improving the districts in question should be allowed to travel free to healthy quarters every night, returning in the morning to work without pay, any fare. It is suggested that there should be every inducement held out to capitalists to take up the matter, and that the state should exercise its right of abandoning the ownership of the lands which are known to present the greatest danger to life in their being reclaimed. It is also proposed that the advantages offered should be so classified that the chief rewards should fall to those who have reclaimed an area of not less than three thousand five hundred square yards. The transport of colonists on the railways serving the respective localities would be facilitated by low fares.

The scheme likewise includes the admission free of duty of the implements and machinery required for the work. Contracts and agreements would also be free from registration duty, and there would be no increase of the taxes levied on the reclaimed land during forty years to come. All buildings erected would be free from taxes during a like period, and every colour of two thousand souls would receive communal rights, and would be allowed to choose the name of its place of settlement. The government would be empowered to make advances for the construction of sewers, &c., and rewards would be given for the planting of trees on a large scale, more particularly for the successful introduction into the reclaimed districts of the eucalyptus tree. The proposal of Signor Torelli has been favourably noticed in leading continental journals, and is considered by them worthy of the careful attention of those interested in its adoption.

## OUR NEW MANAGER.

IN FOUR CHAPTERS.—CONCLUSION.

NEXT morning, Phil continued to see Maria, and improved upon her the necessity of securing the presence of Miss Villars that afternoon. He found Maria quite willing to ask her, as she had great trust in that lady.

He saw nothing of his chief during the morning, but this was by no means unusual, and his thoughts had been so occupied and excited by his visit to Maria, that he had quite forgotten the parting words of Whittaker in reference to himself. He was soon reminded of them. After the usual interval for lunch, he heard on his return that Mr Pike had just gone out, and then he was sent for to the head clerk's room. Whittaker's warning at once occurred to him, and he knew to a certainty what he was to hear.

His foreboding was right, the warning was

correct. Mr Sumner, after a prefatory cough of the most impressive character, expressed his regret at having to perform so painful a duty, but stated that Mr Pike had seen great reason to be dissatisfied with his Hurdley's conduct, and having borne with it as long as he could, was compelled to dismiss him. He handed Philip a cheque for an amount which included a month's salary instead of notice, and said that the young man need not come any more to the office. 'And—I regret to say,' added Mr Sumner with fresh impressiveness, 'that Mr Pike feels unable to give in this instance the testimonial to character and ability which is met of our young gentlemen have received upon leaving the establishment.'

Philip smiled bitterly at hearing this harangue, entertaining no ill will for the speaker, because he was a harmless old fellow, and had, as Phil knew, no choke in the matter. Mr Sumner coughed again, and nervously pulled his grey whiskers.

'I presume,' said Philip, 'that it does not greatly matter if I leave it once.'

'Certainly not, my dear sir, and the old gentleman, evidently greatly relieved at hearing nothing worse than this—' certainly not. If you would prefer to leave as soon as you have checked the invoices you are at, I am sure Mr Pike would have the greatest pleasure—I mean there would be no objection at all.'

With this permission, Philip hurried through the trek on which he was engaged, for he had picked up his mind to a full pre-occupation on which he had been dwelling for some time. He resolved to confront Mr Pike on his visit that afternoon, to entreat Maria from his grasp, if possible, and to urge Darrett to defy the world, rather than sacrifice his daughter.

His arrival at Lower Down Road occasioned some surprise. Maria, who saw him first, was flushed and agitated. On his asking her if she had seen Mr Villars, she replied in a hurried whisper, 'Yes, she is here now with my father and mother, in the other parlour. I found him difficulty with her than I expected, for she had received in anonymous letters this morning, so strongly urging her to be here, and couched in such vaguely threatening language, that she would have felt inclined to come, even if I had not called for her. Yet she does not know what good she can do.'

Here the entrance of Mr Darrett interrupted her. The latter greeted Philip warmly enough, but said in a tone which was too clearly a disapproving one, 'I am sorry to see you in my home, my boy, to-day. Do you know who is coming here directly, and why he comes?'

'I do,' said Phil.  
'Then I fear your visit will only give you pain,' continued the clerk. 'I know what young people feel, although my day is past, but do not quarrel with fate.'

'Isa!' You do not call the vile and crafty plottings of such a man as this Mr Pike, Phil? You do not?'

More Philip would probably have said, but a loud knock at the door announced the arrival of the person he was so impatiently denouncing. In a few hasty words, Darrett begged him to return, for the time it suited. Philip agreed to do so, but added, 'When Maria is called,

as you know she will be, I will come with her. What is to be said, shall be said in my presence.' With this he disappeared, leaving Mr Darnett to nerve himself for the coming interview, with as little comfort in the prospect as it was possible for any man to feel.

What passed between him and the visitor in the opening of this interview, was not known, but those who were in the next room could hear that one voice grew more pleading, the other harsher, as it proceeded. At last Mr Darnett opened the door and called for his wife and daughter.

'One moment, Mrs Darnett, exclaimed Philip, 'let me enter with you. Maria can follow us in a couple of minutes.—I must. It is the last time I shall have an opportunity of speaking, and I will speak now.'

Overpowered by his manner, Mrs Darnett, weak and irresolute at any time, assured the young man to accompany her, and they entered the parlour together.

Pike was there of course, and turned to the door with his blandest smile as he heard the sound of feet. In an instant his expression changed to the sternest frown, and turning to Darnett, he said 'What does this mean? Why is this fellow here? Are you conspiring in some trick upon me?'

'No!—I didn't wish Mr Hurtleby to'—began Darnett.

'You hear that?' exclaimed Pike, addressing Philip. 'Leave the house, sir! A disreputable, characterless servant ought to be glad to skulk anywhere out of his master's sight. Leave the house, sir!'

'When I skulk from you you may call me a characterless scoundrel,' retorted Philip. 'I am here by an older and truer right than you possess. I am here to protect the girl who has promised to be my wife, and I will do it. You are a coward, I tell you that to your cost.'

'Darnett,' cried Pike, turning, with his dark face livid with rage, to the old man, 'do you countenance this fellow? I know him to be the associate of thieves and sharpers. Do you even tolerate him in this?'

'N—no,' stammered Darnett feebly. 'I have told him already'—

'Then, by Jupiter!' shouted Pike to Philip, 'if you do not stand aside and allow Miss Darnett free entrance, I will horsewhip you out of the'—

He stopped with such abruptness here, and glared so wildly into the hall over Philip's shoulder, that the latter involuntarily glanced round also. Maria stood close behind him, leaning on the arm of a lady dressed in black, whom he had seen in the further room, and known as Mrs Vallens.

When he had previously seen her, a heavy black veil had hid her face, thus was now lifted, and showed pale but set and composed features. 'She is here,' said this lady, 'Mrs Darnett is here. What have you to say to her?'

Mr Pike, whom she had addressed, turned to a paleness which was all the more striking for its livid hue, and grasped the back of a chair, as if to steady himself.

'Is that the man who has presented you, Marian?' continued the lady. 'But I need not

speak; I might have known it. I might have known that there was but one man in the world who could be at once so cruel and so mean. That man stands there. That man is my husband!'

An electric start shook each of her listeners, save the principal, whose white lips seemed trying, but unavailingly, to shape some words.

'You need no confirmation beyond his abject look,' continued Mrs Vallens, 'he will not deny it, you may be sure.'

'I—I thought you were dead,' gasped Pike. 'I was assured of that, Mr Darnett, or I would not—I would not!'

'And he would sooner have beheld any spectre than his mother in life,' said Mrs Vallens, as the other faltered. She preserved the same cold, hard, level tone in her speech, affording a striking contrast to Mr Pike. 'But there can be no discussion between us—Margaret!' At this summons, the servant from Farnlow Cottage appeared. 'Go over to the police station in the Abbey Road,' continued her mistress. 'Tell the inspector on duty that we wish to see him here at once. Go directly.'

Mr Darnett, who seemed to have much of her mistress's firm, resolute temperament, departed without a word. Pike threw one deprecating glance after the woman, and seemed for the moment to entertain the intention of plunging forward to seize her, but not only were Darnett and Hurtleby between him and the hall, but in the open doorway was the cold, awful face which had denounced him.

'Now, John Elton,' continued the speaker, 'I have no wish for vengeance, I only desire peace. I only wish to save this poor girl from the fate which was my own. If you wish to fly, I will not prevent you. But first you shall write in authority for the succession of this young man—your husband soon will be—to your share in the business.'

A low but unrepresable exclamation broke from the spectator at hearing this.

'What?' exclaimed the lady, 'do you hesitate? Will you wait until I explain to the officer, who will be here in ten minutes time, how you became possessed of the money which brought your share?—No, I thought not. You will write it, and with it a release for Mr Darnett. Quick, sir. No matter how informal it may be, there will be no one to oppose it. You have no time to lose.'

He seized a pen and hastily scrawled a couple of documents, which he handed to Darnett, who in turn gave them to Mrs Vallens. She glanced at them and said 'These will do, now you may go.'

He rose. His wife—it seems strange thus to describe her—moved on one side to let him pass. 'We may meet again,' he said, pausing on the threshold—as was to Hurtleby he spoke, 'and if we do'—

'John Elton! you are lost if you delay a single minute,' interrupted Mrs Vallens. 'I see the inspector, with another officer, walking towards this house.'

It was even as she said, for as she pointed to the window, all could see in the road, which usually faced the house, two men clad in the familiar blue uniform of the police.

A single terror-stricken glance was all that the

fugitive paused to give, and then he rushed through the house, crossed the garden at the back, and disappeared in the fields beyond.

The inspector and his satellite, when they arrived, had a brief interview with Mr Darnett, who, without entering into particulars, explained to them that the danger which had made him send for their services was now past, and they, being thanked, quietly retired.

When they were gone, there was a sudden tendency to hysteria on the part of Mrs Darnett and her daughter, while a natural curiosity was exhibited by Mr Darnett and Mr Hartley to obtain the key to all this mystery. Seating himself between the two women, saying a few firm but kindly words to the mother, and soothing Maria as if she were a child, Mrs Vallans—still to be called so—began.

'My name, as you must have learned, is John, it is so, because the man who has just left us bears that name, and he is my husband. I was educated in England, but afterwards resided with my father, who was a merchant, at Gibraltar. While there, not long before my father's death, I met John Lister, who had, I believe, at one time held a commission in the army, and at any rate, was in my eyes a handsome and honourable gentleman. My father, whose experience was greater than my own, never liked my entering, for such he soon became, he was staying at Gibraltar in the interest of some firm. My father would not forbid the engagement, but he did not encourage it. He died, and I found that his money was left to me, his only child, but through trustees, so that, without their consent, none of the principal could be withdrawn from its investment. Later than guided, the price was so considerable that it tempted John Lister to wed me, and we came to England.

'This was not more than five years ago. I've we had been married six months, he tried by every persuasion within his power to induce these trustees to give up to him a part at least of my fortune. But they did not like him, and his plausible pretence—which was entirely—failed. Then he ventured upon a bold stroke: he forged their names and employed some unscrupulous agents, so that he suddenly obtained possession of the chief part of my property. The instant he succeeded in this, he abandoned me, and until this day I never saw him again. I was reduced almost to poverty, and my only relation—my mother's brother, who was in business at Bombay—hearing of my misfortune, invited me to go out, and I gladly accepted his kindness. But I reached Bombay, however, he had died, but he was unmarried, and I found myself his heir. I returned to England, and thoroughly imbued by my experience, I resolved to live a secluded life, as a limit might be under my mother's family name. All efforts to discover my husband were vain, although my trustees offered a considerable reward. I was not sorry that this was so. They would have been glad to see him in Scotland for life at Portland. I only hoped I might never see him again. Owing to my absence from England, my return under another name, and some confused report of the death of my uncle, I found that there was an impression abroad that I had died in India. I never con-

tradicted it. You now see what has led up to the events of to-day.'

Her husband instantly understood much better than before the secret of her presence, but there was yet much to be explained, and the interview lasted a long time.

The documents obtained from Pike—it would be confusing to change his name at the last moment—would have been of small service, but for the influence of Mrs Vallans and her trustees, both of whom were still living. The evidence brought forward by them thoroughly convinced Messrs More, Kewley, & Co that they were right in allowing Philip Huttley to take the share in their house lately held by Mr Pike. The transfer was made, and Philip's accession to the firm was announced in the very same week in which Maria Darnett became his wife.

This was soon after the flight of Pike. But before these events came to pass Philip received a letter from an acquaintance, with the insertion of which we may fairly conclude

TOA AND GRAVE,  
OLD MARKET PLACE, CHESTERMAN  
January 14th, 18—.

MR HARTLEY—DEAR SIR—I am still working the current business, and shall do so till the racing season begins. I have two or three very good things for the early spring handicaps, and will put you on, if you feel inclined to do anything that way. I heard all about Pike, and of his being obliged to step it. Serve him right. One of our men says he has gone to the Cape of Good Hope. He heard this from his brother who is steward aboard the vessel which took Pike out, so you can do as you like about following him up.

I knew Pike years ago, and helped him in some law business, which I afterwards found was simply cheating his wife out of her money. I was dressed up like the second trustee, the banker knew the principal one, so Pike forged his signature. I went as the stranger, and forged likewise. I was a different looking party then. I did not know the full extent of what I was doing, and I give you my word all I ever had for the job was ten pounds. He was the earnestest man I ever worked with. But the worst of it was, I was out on a ticket of leave at that very time, and he knew it, so when we met in Hyde Park mouth and he killed my poor little thing, I was afraid he would split on me, for I had been the conditions, and the police would have looked me up to a certainty if they had got hold of me. As for him, his wife was dead, I heard, and so there was no one to prosecute him, nor did I exactly know what he had done, but I was a man with a lot of money can get out of anything.

However, I knew his wife well enough by sight, and when I was hailed at Finsbury I tried to take up a face, I assure you, sir, I could hardly believe my eyes when I saw standing before me, alive and well, the supposed dead wife of Pike. He was called Alice when I knew him. I thought I was to win, so to make sure, I told her with a little bit of my father. That was enough. Then, when I knew all the games this Pike was up to, I went to myself. 'Here's a chance of doing a good turn to my friend Mr Hartley and his pretty sweetheart, and of

spoiling Piko's game? And I did—you must own that. You promised to get his wife down to face him at the very moment he thought it was all his own, but I make quite sure, I wrote her a letter myself, and that fished her.

Well, I wish you luck and happiness, I am sure, for I never forget a friend, not that I shall ever call upon you for the last you are of me the letter you will like it of course.—Yours respectfully,  
JOHN WHITTAKER.

I shall call on you with the loan of five pounds for a couple of months! I would not trouble you, only I owe a trade here, and I want to start her.

The reader will be glad to know that Mr Whittaker's request was complied with, and in addition to the £5, and that Miss Whittaker stood gaily by Philip Harkby's fast child.

## THE MONTH

### SCIENCE AND ARTS

The approaching eclipse of the sun which takes place on May 6, but is invisible in our latitude, will, from its unusually long duration—nearly six minutes—give the various expeditions now on their way to the Pacific an opportunity of obtaining valuable results. The English party will, it is understood, mainly direct their attention to photographing the corona and its spectrum. The French, under the guidance of M. Janssen, will also employ the camera, but for another purpose. During the period of totality, they will expose a small battery of photographic plates, with a view to secure the images of any hitherto undiscovered planet which may be travelling within the orbit of Mercury, which is the nearest known planet to the sun. The probability of such a body or bodies has been often discussed, especially among our continental neighbours, and the theme is one of intense interest to all students of astronomy. It will be readily understood that a planet so near our luminary could only be observed when the light of the latter is cut off by an eclipse.

The subject of sun spots and their influence upon things terrestrial is one which is so full of interest both to astronomers and those who only pick up such scientific knowledge as happens to be thrown in their way, that the paper read before the Society of Telegraph Engineers on the Connection between Dutch currents and Solar Spots could not fail to evoke much attention. Mr Adams, who is a member of the postal telegraph service, had the opportunity of making observations during the electric storm of last November—a period of disturbance during which spots on the sun were easily discernible by the unaided eye, and these observations, of which he gave detailed results, were carried out on the wires between London and Leeds, and London and Leicester. His most important observation was that the electric storm lasted only whilst a sun spot was actually centred on the earth, and this occurred between the 17th and the 21st of the month named. He inferred that spots arise in the solar atmosphere 'which permit the

solar body to act more freely in disturbing the electrical condition of the earth, and that the solar atmosphere has really a screening effect on this action.' If this theory be correct, it would point to the possibility of predicting such disturbances.

For many years Dr Peters, of Hamilton College, United States, has been engaged upon a work which will, when complete, represent a most important addition to astronomical science. This consists of a Celestial Chart and Catalogue of the stars down to and inclusive of those of the fourteenth magnitude. Before the advent of the telescope, such star catalogues were produced, but they were naturally of small dimensions, and comprised little more than one thousand stars. After the telescope had brought into view such myriads of unsuspected celestial catalogues became more numerous, but still their accuracy could not be relied upon. The most extensive of these was that of Argelander, which included stars down to the ninth magnitude. The work of Dr Peters charts and limits that of Argelander, to give room for the immense increase in the number of stars tabulated. The work, which already has occupied twenty three years, has been accomplished with the aid of a thirteen inch reflecting telescope.

Mr Rawlin has given to the Society of Biblical Archaeology a long account of his recent explorations in Assyria and Babylonia, which seem to have been quite as successful as his former expeditions. In the course of excavations which brought to light edifices, containing numerous chambers, courtyards, and corridors, there were unearthed nearly forty thousand inscribed tablets. It was quickly seen that these were of unaltered clay, and they showed signs of crumbling, to produce an exposure of air. But this difficulty was met by the ingenious plan of baking them before the atmosphere had time to act upon them. In this manner they were nearly all saved from destruction, and have been transmitted to England.

Mr R. B. White, after a residence of seventeen years in the central provinces of Colombia, took a recent opportunity of bringing his experiences of that country before the Royal Geographical Society. After detailing its wealth in gold, platinum, and other metals, and describing its valuable timber, diamonds, guano, gums, &c., he made some interesting remarks respecting the Panama Canal, about the progress of which so little seems to be known on this side of the Atlantic. Here, however, we have the opinion of one who has traversed the isthmus since the canal works were commenced, and as Mr White is a trained engineer, his opinion is worth having. Mr White believes from what he saw, that the canal will be finished at the money holds out, and he sees no reason to fear a break down in that direction. At the same time, the productive and habitable districts in the neighbourhood will become valuable, easy of access, and will in time afford a sufficient food supply for the thousands and the traffic which the canal will attract.

The almost total failure of the hop harvest during the past year has led Miss Omerod, the consulting entomologist of the Royal Agricultural Society, to issue a circular upon the subject.

she has done with the object of collecting information from hop growers, and inducing them to make regular observations of their growing hoppers, with a view to attacking the enemy, the hop aphid, on its first appearance, and to endeavour to find out its winter hibernation, which at present is unknown. If the aphid first appears as 'lice'—that is, wingless—they most likely can be traced to some shelter near at hand, but if they appear as 'flies'—that is, winged—it may be inferred that their wings have been rubbed from them somewhere. Some entomologists are of opinion that the 'fly' mites from plum and other bushes to the hop plants in May and June—that is, mites which by close observation can either be useful, or proved dangerous. Guides to the mode in which these and other observations can be carried out are detailed in Miss Gurney's circular, and no doubt these instructions will only be too fully set upon the suggestions of the author, and to send their results to her at Dunbar Lodge, near Salisbury.

It would seem that the Martini Henry rifle which only recently appeared as the most perfect weapon of the kind in existence, and which surprised the Sander in our infancy a rifle has not altogether answered its purpose, for a Committee has been appointed to conduct experiments with a view to its improvement. The Committee has also to report upon the different patterns of magazine small arms which have been submitted to the War Department for trial. These are of the Winchester repeating rifle type, and contain in the stock, or in a tube lying under the barrel, a magazine of cartridges, which can be fired in rapid succession.

The work of this Committee will be rather disturbed, if the report of a new American invention proves to be correct, for it tells us of a novel form of cartridge, which, if efficient, as it is said to be, must cause a revolution in the manufacture of small arms. This cartridge has no case, therefore, the extracting mechanism, which is such a notable feature of all modern rifles, is not required. It is said to resemble paper pulp which has been soaked in some explosive and pressed into a hard roll, the bullet being attached to its front end. The arrangement is so contrived that, on ignition, the bullet and every trace of cartridge is ejected from the barrel without leaving any residue in the chamber.

With a diameter of one inch, and a length of eight inches thick, a two-inch plank, and was finally flattened on a stone wall. The description of the invention, however, causes more probability with it, than its stated performance, for it is still open to conjecture that the ten inches of timber may have been very soft, or the bullet may have been unusually hard.

One of those curious outbreaks of natural gas which occasionally occur is reported from a district in Pennsylvania. In the course of some drilling operations, the gas was 'struck' at a distance of more than one thousand feet from the surface. It immediately ignited, burnt down some temporary buildings, and caused a small conflagration, which nearly did away with the place. A plate glass factory is in course of erection on the spot, and the promoters are joyful in the

anticipation of getting light and fuel for their furnaces free of cost.

We, too, may indulge in anticipations that our illuminating gas may become much cheaper than it is at present, not because of any rivalry from electricity, which is too remote to be considered at present, but because more than one means of obtaining it, from materials other than coal, have recently been perfected. The first which calls for notice is the process of Colonel Chamberlain. The materials entered in the preparation of the gas are petroleum, water, and air, in the process it is said to be cleanly, simple, and safe. The first two constituents are dropped in small quantities into a retort, and as they are decomposed, the resulting gas is led off to a washer, and thence to a gasometer. After this operation, air is forced through the retort, it is decomposed, and in this proportion of three to one of gas previously made from the oil and water, is added. The contents of the gasometer. This compound vapour is said to afford a gas of twenty-one candle power, and to cost only eight pence per thousand feet. (Without further information, we refrain from commenting upon this mode of producing gas, but we feel a difficulty in understanding how it can be produced from such materials and at the same time be free from danger.)

Another new mode of manufacture is represented by the Kohler & Co. gas, which has been perfected by Messrs. Rogers Brothers, of Walsford, and has had a practical trial of fifteen months. This gas is said to be white, so that colours can be distinguished by it, and to contain neither carbonic acid nor sulphur. Its cost is somewhat less than two shillings per thousand feet. It is made in a special form of retort from shale oil, which is injected in small quantities by the aid of a steam jet. One great advantage in this process is that the plant of oil and gas works can be adapted for its production with very little trouble.

Another Electrical Exhibition in London. The Westminster Aquarium, which attracts crowds of visitors, tells us that the interest in the newer form of illumination continues unabated. Perhaps one of the most interesting exhibits is the Liphinstone Vincent dynamo machine, the outcome of some researches undertaken four years ago by Lord Liphinstone and Mr. C. W. Vincent, I.R.S. This machine produces four hundred and eighty

continuous revolutions a minute, and with gas turned on wire were rendered white hot, and melted in brilliant convulsions. A coil of wire immersed in a vessel containing three quarts of water, became so hot when the current from the machine passed through it, that the water boiled in half a minute and was mostly ejected on the floor. A steel file treated in one of the cabins of an electric light, melted like tallow, and then out poured of brilliant sparks. Finally the current was applied to an arc lamp and to a lamp in power one hundred thousand candle. Such a lamp is indicated for use on ships. It is to search the surface of the sea for lurking torpedo boats.

A subject which ever draws itself more closely on the attention of our sanitary authorities was lately treated exhaustively in a paper read before the Society of Sanitarians. It described the

new treatment of sewage matter which has been successfully worked out and put in practice by Baron de Pollewill at München. In this process, all operations are conducted by means of closed vessels, so that no unpleasant emanations can escape. From these air-tight tanks, which are submitted to heat, the gaseous products are passed through the furnace and burnt. The contents then undergo a thorough mechanical mixing, after which sulphuric acid is introduced, and the carbonic acid thus generated is again burnt in the furnace. After some further processes, the sewage matter is passed through evaporators and through a drying machine. The ultimate product is a powder containing less than nine per cent of moisture. Analysis shows it to be so rich in nitrogen, alkalies, and phosphoric acid, that it is worth quite as much as imported guano. With regard to the financial results of the manufacture, they seem to be as successful as the manufacture itself, for although the fuel necessary for its production, mainly coal, has to be paid for at the rate of twenty-three shillings per ton, a dividend of twenty per cent is earned. If such a system could be made universal in Britain, we should add a large item to our revenue, and gain still more in pure air, pure water, and consequent freedom from disease.

There have been at different times many attempts to form an alloy of iron and brass, and although known to a partial extent has crowned the labours of the chemist in his laboratory, when tried on a commercial scale failure has resulted. The problem, however, it seems at last been solved by Mr A. Dick, of 110 Cannon Street, London, who has produced a product—which he has christened Delta Metal—which possesses great strength and toughness, and which will no doubt prove of great use in the iron and steel trade. A striking strain of twenty-two tons to the square inch, whilst forged or rolled bars show a tensile strength of thirty-three to thirty-four tons. The new metal takes a high polish, does not easily tarnish, and is said to be as superior to brass as steel is to iron.

The two metals last named form the subject of a new American invention which, under the name of *Steel-iron*, is likely to meet with numerous applications. The compound material is thus produced: A mould is prepared having a division of thin iron plate dividing it into two compartments. Molten steel is run into one, whilst at exactly the same time the other compartment receives a charge of molten iron. If the temperature and the thickness of the dividing plate have been properly adjusted, the plate forms a welding medium for the two metals, and a new half iron and half steel is produced. There are many uses for which iron thus faced with steel will be found valuable, armour plate and rails being among the number. From its ingenuity, this process deserves success, and from its simplicity it is likely to obtain it.

The French scientific periodical, *La Nature*, publishes an illustrated account of a machine for clearing snow from railway lines. It is attached to the front of the locomotive, and contains a steam engine of its own, which, working, a blower draws in the snow by suction. The

snow is afterwards, by the action of another blower, scattered where it can no longer form an obstruction. This machine is the invention of Mr Stock of America, who calculates that it will be as efficient in clearing a railway track as a staff of five hundred men. Of recent years, the want of such a contrivance has been felt even in the southern counties of England, and if it be as effective as its inventor assumes, every railway Company in the country will become his willing customer.

'On the Increased Destruction of Life and Property by Fire—What is the Remedy?' Such is the title of Mr Walford's paper, read the other day before the Society of Arts, in which he carefully detailed the practices of various countries, gives an estimate of loss, particulars of insurance, points out the causes of fires in dwelling houses, and finally suggests his remedy. Briefly, he tells us, is the only country which systematically records destruction of property by fire, and it is curious to note that these records are held to indicate the measure of political content or discontent which prevails. This end type of thermometer rose to a high figure during the time that the word 'Nihilist' was so often seen in our newspapers. The clever Chinese induce vigilance by making the entire district responsible for any fire which occurs in it, but we should think that a difficulty must arise when the entire district itself is burnt out—not in no common occurrence where wooden houses prevail. Incidentally, Mr Walford avers, from personal knowledge, that the United States possess a fire brigade system which for completeness and efficiency is nowhere at all approached in Europe.

The causes of fires in dwelling houses are grouped under two heads: (1) Carelessness, and (2) Want of care, and it is more than likely that under the second category the majority of fires must be placed. The remedy that Mr Walford suggests is that a kind of coroner's inquiry should be held over the ashes of every conflagration, the cause of which is obvious, or as he puts it: 'That where the origin of the fire is not evident to the chief of the fire brigade or other competent authority, an inquiry be held.' We may note here that a French journal gives a recipe for a fireproof paint or varnish, which is made without the help of asbestos. Here is the formula: Finely powdered glass, twenty parts, calcium, twenty parts, any kind of soda, twenty parts, calcined lime, ten parts—mixed to a proper consistency with water glass—that is solution of soda. The first coat of this paint will harden in a few hours, after which, another coat can be applied when the wood or other inflammable substance so treated may be considered fully protected.

So many patent medicines, ointments, and toilet preparations have the name 'electric' applied to them, that when we hear of the invention of 'electric flannel' we are at the first blush disposed to be sceptical. But the invention, which is due to a French surgeon (Dr Claudet), seems to be really what is professed. The flannel is interwoven with threads which have been saturated with metallic products, until the entire fabric represents a modification of Volta's dry pile. It has been submitted to experiment by M. Dumas, Professor of Physics at the Museum

Lyceum, and M. Portevin, of the Polytechnic School, who have satisfied themselves that electricity is actually liberated by the friction, especially if it be placed in contact with the moist surface of the body. It is claimed for this new material that it is efficacious in cases of rheumatism.

Turning to a more ambitious application of electricity, we may note that the first run car called by that agent was tried successfully a month at Kew, in the presence of thousands of curious sightseers. The car was of the usual street type, carrying forty passengers. It weighed with its apparatus four and a half tons. The secondary batteries or cells, of the Paine & Allen Volcanic pattern, are placed beneath the passengers' seats, and these cells are in electrical communication with a Siemens dynamo machine placed beneath the car, which gives motion to the wheels. The car is lighted by electric lamps, and is fitted with electric bells, all deriving their power from the mysterious boxes beneath the seats. It is claimed that this car can be worked at one third the sum required to horse an ordinary car.

It is said we learn that the opening of the St. Edmund Railway seems to be launching this country hardly less than those more immediately affected. Fully fruit and vegetables are now conveyed, without impediment, from all parts of Italy to Oland, Antwerp, and Rotterdam, when they are brought by first steamers to London in other British ports.

The Americans have commenced the manufacture of glucose or grape sugar in real earnest. From American papers we learn that a new factory has been established in Chicago which will consume twelve thousand bushels of maize daily. Maple sugar and sorghum are unequal to the demand, but besides the demand for most sugar, there is an enormous one for molasses, which can in this way be produced from maize very cheaply. In the Far West, this grain has in many places been so cheap, that it was actually cheaper for fuel than coal, or even wood. As the Chicago factory is only likely to be the forerunner of others, doubtless the price of maize will be enhanced, not only in America, but here, since, for a time at least, a check will be given to its exportation to this country. As it is now very largely used here to feed cattle, pigs, and poultry, the new manufacture is not unlikely to affect the production of beef, pork, eggs, and chickens at home. Under such circumstances, the more general use of buckwheat, which is cheap, nutritious, and especially suitable for poultry, may be advised.

Some experiments have lately been made in Paris before a number of people assembled at the back of a theatre, which was arranged to represent a miniature stage, floor, &c., in order to witness the effect of an Automatic Fire Extinguisher invented by M. Oriolle. The woodwork and scenery having been set on fire, soon blazed up, but in a few minutes the flames were extinguished by a sudden rush of water, which was automatically discharged, and which continued to flow until a tap was turned to shut off the stream. This Extinguisher is made in the following simple way. A pipe is connected with a high-service cistern, and is firmly plugged at the open end.

This plug is kept in its place by a double cap of an alloy which easily fuses at a moderately warm temperature, and soon after the outbreak of the fire, the metal caps melt off, the plug is forced out by the pressure of the water, and when it begins to pour out, an electric alarm is sounded at the nearest station, which lets those in charge know that the Extinguisher is at work. This simple contrivance—which, if we mistake not, is somewhat similar in principle to one which has already been adopted—could be easily arranged in theatres or any buildings especially liable to catch fire, and which possess a sufficiently high and large storage of water to give the necessary pressure.

## BOOK GOSSIP

The city of Venice, with its long descended pedigree, its last word in romantic associations, its innumerable ghosts of the dead past, and the wretchedness and misery of much of its present existence, will always form an object of special interest for tourists on the continent. To those who have seen Venice, and those who hope to see it, as well as to those not embarked in either of these classes, *Venice*, by W. D. Howells, 2 vols. (London, & David Douglas), will offer much attraction. Those who have read Mr Howells' novels, especially *A Foregone Conclusion*, will understand what they may expect in the matter of style and treatment of Venetian character and incident. We are not sure also but readers will find these two handsome little volumes on actual Venetian life more interesting and picturesque than the traditionally illustrated work of fiction we have just named. As equally dealing with Venice, there is in both works a good deal in common, but the only point perhaps that both are equally drawn from life. In the volumes before us, however, we cannot help observing that Mr Howells, with the assumed superiority and characteristic narrowness of the school of American writers to which he belongs, never fails to take every possible opportunity of minimizing and sneering at Lord Byron. Mr Howells should remember that the poet has been broken against the stone.

Mr Howells, we may observe, held at one time an official appointment at Venice under the American government, and no doubt in this capacity had excellent opportunities of observing the various phases of life in the ocean city. It is of interest to note what he says as to the strong feeling of antipathy which still exists on the part of the Italians of Venice towards the Austrians. The former have never forgotten the defeat at their patriotic hopes of union with Italy in 1848, and the feeling of resentment towards their old oppressors has become thoroughly interwoven with Venetian character. "Indeed, therefore," says our author, "of finding that public gaily and private hospitality in Venice for which the city was once famous."

friendship with neither party, society is exclusive association with the Austrians or with the Italians. The latter do not spare one of their own number if he consorts with their masters, and though

a foreigner might expect greater allowance, it is seldom shown to him. The Italian [woman] who marries an Austrian serves the dearest ties that bind her to life, and remains an exile in the heart of her country. Her friends merely love to cast her off, as they cast off everybody who associates with the dominant race.' This is an unpleasing picture for those who may contemplate a lengthened residence in Venice, but for those who only go, as most do, merely as temporary sightseers, the Queen of the Adriatic will still maintain an unfading and romantic attraction.

In a little book, called *A Tour Round the World* (London: Infield, 160 Fleet Street), a working man, named Mr. Albert Smith, has given his experience of such a journey in a simple yet graphic way, which bears the impress of an individual mind all through. This has been excellently stated by the Earl of Roxbury in a letter which he addressed to the author after reading his book. 'I do not think,' says his lordship, 'I have ever seen a book which, professing to be by a working man, appeared to me so thoroughly the genuine, unaffected record of a working man's adventures. I have read books by working men which might have been written by Dukes or Archbishops for any individual impress which they bore. Your book, on the other hand, seems to me very of the man who wrote it: the fun, the sympathy, the tenderness, are all genuine and irrepressible to me. I seem to know the man that wrote it, a practical working man, who knows that he must travel amid many discomforts, of which he determines to make the best, who knows that he can only spare but a short time to see his long lost relations, and makes the best of it, who loses his money in an accident, and cheerfully makes the best of that also. No one who reads the book can help liking the author, who seems a real *Mick Topley*, a character that we believed only existed in fiction.'

The tour so described extended over six months only—from July to December in 1881, and embraced Australia and New Zealand, San Francisco and the United States of America. As the little book containing these records costs only a shilling, it is within the reach of all who delight in a tale told in a truthful and homely manner.

### ECONOMY OF COAL IN HOUSE FIRES.

A GREAT proportion of the fuel which is used for generating steam and for household purposes is unfortunately wasted, because of our method of consuming it. Half burnt gases are hurled up the chimney, which pollute the outside atmosphere, and give rise to the smoke nuisance of our large towns. In large factories, a good deal might be done, by means of smoke consuming apparatus, to lessen the smoke nuisance, but little or nothing has as yet been done to diminish it in connection with ordinary fires.

A very simple and practical suggestion for the saving of fuel and the decrease of smoke comes from T. Pridgen Teale, M.A., surgeon to the General Infirmary at Leeds, who has expanded and published a lecture on the *Economy of Coal in House-fires* (J. & A. Churchill, 1883). The

discovery made by Mr. Teale, while endeavouring to cure a smoky bedroom fire, was to the effect, 'that slow and efficient combustion of coal in house fires depends upon two conditions in combination, one, that no current of air should pass through the grate at the bottom of the fire, the other, that the space or chamber under the fire should be kept hot, and that these two points could be secured in ordinary ranges at the cost of a few shillings.' This condition is secured by what he calls a 'coal economiser,' which is simply a shield of sheet iron, that stands on the hearth, and rises as high as the lowest bar of the grate, against which it must fit accurately, so as to convert the vacancy under the fire into a hot air chamber, and shut off all draught from reaching the bottom of the fire. This is in accordance with a popular notion that a fire will not burn unless a draught passes through the bottom of the grate. According to Mr. Teale, a bottom draught renders combustion less perfect by cooling the grate and bottom of the fire, and driving the gases which ought to be consumed up the chimney.

An 'economised' fire differs somewhat from an ordinary fire in the length of time it will burn without rekindling. Mr. Teale's bedroom fire frequently lasts ten or twelve hours, giving out a rich red glow during the greater part of this time. When fresh fuel is added, the heat below is so great that the coal burns like cannon coal, and becomes a piece of red hot coke without losing its original shape, and the action of the air being restricted, it is consumed away to a fine ash. This is not the case in a fire with the economiser, as the cinders are frequently cooled down below combustion point from contact with the grate. In lighting such a fire, there are no cinders upon which to build it, the economiser should be drawn away for a little, but if there is a bottom of cinders and ash, the fire can be lighted without removing it. It is proper to mention that most of Mr. Teale's experiments were conducted with Yorkshire coal.

Mr. Teale cannot speak so confidently of the principle of the economiser as applied to steam-boilers, but he is decided enough as to the three main points achieved by its use in common household fires. These points are: (1) A saving of coal, (2) diminution of smoke, (3) abolition of cinders. By its use in his own kitchen fire, a saving was made of about thirty six pounds of coal per day, equal to threepence a day, and four pounds sterling a year. Not satisfied with his own experience, he wrote to thirty five persons who had tried the economiser. The thirty who sent replies almost unanimously decided that it saved coal, in one case it meant a saving of a ton in the kitchen fire in three months. The replies recurred to another set of queries as to whether it gave out less or more heat, were decided in favour of 'more heat.' The second statement as to the diminution of smoke has not been so easy to prove, but from the more gradual and perfect combustion of the coal, Mr. Teale argues that it must be so. The result that is most clearly apparent is the more complete combustion of coal and cinder, from close observation it has been found that the economised fire produces two and a half per cent. of ash, the ordinary fire ten per cent. of cinder and ash.

As a hint to those who may wish to try the

expedient here recommended, we give a few details. Every grate should be carefully measured, and the economiser adapted to its special shape. Ordinary economisers are usually made of cast-iron, of cast-iron plate, with three or four bright steel moulding at the top, half inch moulding at the bottom, with knobs as at panel. Kitchen economisers are made of sixteen gauge iron, with half inch semi-circular iron at the top edge, with supports in scroll form of half inch semi-circular iron. The economiser may be combined with the ash pan and used as a drawer to catch the ashes, and along with it a second shield, which hinges in front of the fire itself, attached to the lower bars, is sometimes used. This shield is still on trial, however. There is little need of a poker when the economiser is in use.

A student of agriculture, according to Mr. Teale, should have as much fire-brick, and as little iron as possible, as fire-brick returns and accumulates heat, while iron runs away with it, often in dirty fire-logs wasted. The brick in the walls of the furnace should be of fire-brick, while the brick should form an arch over the fire, so that when it becomes heated it may act as a slight check to an increased smoke, and prevent its coming.

At the present time, rents are falling, and the land is going out of cultivation, or becoming impoverished. In England, landlords have been offering land for no rent, and failing to get men to occupy it. All this, in a country which imports more of the necessities of life produced by the land than all the other nations of the world, counts to the urgent necessity of a move in advance in both the science and art of cultivation. Let readers should imagine the writer a peasant, let them listen to the language of some of our leading agriculturists.

Mr. James Hay, farmer, Little Ythure, when presiding, more than a year ago, over a meeting of two thousand farmers in the city of Aberdeen, said: "Land is not only being worse cultivated, but in some cases it is going out of cultivation, our flocks and herds are decreasing by millions." Mr. James Caird read a paper, last November twelve months, on the land question, in London, before the Statistical Society, of which he is President, when he used the following language: "The land in this country has become less productive. To restore the condition of the soil of an old country is becoming more difficult and costly. As one generation follows another, more and more of the natural fertility is taken out of the land, and a corresponding higher rate of farming is required to maintain it." Mr. William Riddell, a well-known Scotch farmer, read a paper, a year ago, before the Fife-shire Farmers' Club, wherein he maintained that the land was rapidly becoming impoverished, and added: "Five of all the important fresh and salt water fish of the national waters, modelled from natural specimens and coloured from life. These cards will be further supplemented with photographs of all the fish, each picture giving the exact length and size of the fish. To these are added alcoholic preparations of the fish themselves. All the

works written on American fish are to be sent, with the fishing literature to dry. To illustrate the whaling business, every variety of harpoon, lance, and gun in use, with all the projectiles employed in the capture of the cetaceans, are shown on screens. This collection is complete. The archaeology of whaling has been exhausted to make this exhibit perfect. There will be sent a perfect whale boat, fully equipped with everything that is wanted, drawn to the land by a horse. In this collection are exhibited the log-books of former whaling cruises, which are very curious specimens of marine compilations. A model of an cysticidal in its natural condition is being made, with other models showing how excessive dredging has changed its face. All the names of the cetaceans are to be exhibited. After this come the numerous methods of packing and canning, cylinders, &c. &c.

An exceedingly novel feature of the Exhibition will be the presentation of all the phases of fishing, illustrated in a pictorial way. To do this, photographs of the various methods of fishing have been taken all along the coast and taken their pictures from life. Besides this, a whole class of sketches in crayon has been made illustrative of the various fishing, every picture has its label, a printed label. For instance, here is one entitled "Drawing Mackerel," which reads as follows: "On the left is a man splitting a mackerel. In the centre another 'gobling' or circumventing the fish, which he holds in his left hand. The man on the right, dressed in a 'p'tie' of blue, is 'cutting in' or 'Every stage, then, in the fish is caught until it is finally prepared for sale."

In fish culture, every process in use in the United States will be exhibited. One of the most attractive features will be a series of tables provided with the various apparatus. Thus apparatus may be divided into three departments: the closed apparatus, the open, and the floating apparatus. There will be a large water tank, the water in which will be forced through the fish-hatching apparatus by means of a pump, and the fish will appear out of the various kinds of apparatus will be introduced by means of glass tubes. Another important feature will be the models of a group of experts in the art of promoting the growth of the fish in the water. The various methods of life are well shown exactly the manipulation used in stippling, salmon. There will be photographs of all the American fish which have been introduced by fish culture in the United States, explaining the development of the egg in various series of specimens will be shown illustrating the growth of the fish in the egg from dry, to be followed with others explanatory of the use and condition of the fish after it has been hatched out. The fish-hatching apparatus will be practical working ones, easily so that it is used, with all the apparatus which will be for the transportation of the eggs, the young fish, the feeding, troughs, the fish pens, with models of the various methods of carrying young fish over the United States. Finally, on a large map will be shown all the hatching houses in the country, with the various points where shad, salmon, trout, white fish, carp, &c., have been distributed.

"When the section of apparatus used by our

fisherman is examined, the visitor is amazed at its magnitude. Here is a model of that vessel not used by the mackereler, and to show its size, a model of a mackerel schooner, with the same boat, is suspended near it. Some idea is thus afforded of proportion. The hats, boots, trawls, and engines of capture will fill numerous tables. After this come the rods, reels, lines, and first used by the angler. Here are cases of flies, with pictures of the insects which they imitate. A fishing box—one of those light, portable boxes which pack up in small space—will show our English friends how the American angler takes his case. This house will have in it all the things the angler may want, his bait, his shot, and his cooking utensils. Nothing has been forgotten or overlooked which might illustrate the ways and manners of our New England fishermen, for here are his amusements, his games, the literature he reads, the medicines he takes, the clothes he wears, the food he eats.

While the description extended over immense tables columns it could hardly be more than a cursory view of the thoroughness of the exhibition. All the sea-birds, the animals which prey on fish, will be sent to the table with all the picturesque fishing gear in use by the American fisherman.

In addition to the objects illustrating fish and fishing, the Lighthouse Board and the Lark Vining Service will send exhibits. Everything has been so arranged and systematized that the process of installation in London will require but very little labour.

#### THE RACE ACROSS THE ATLANTIC

A correspondent has kindly transmitted the following particulars in connection with the first Atlantic swimmer. He says: "The writer of the interesting article under the above heading, which appeared in *Chambers's Journal*, No. 661, 1882, places the steamer *Great Western* in the van of the race of ocean swimming. He evidently was not aware that on the occasion of the ferry-voys of the *Great Western*, several and intensely exciting struggles actually took place between that vessel and the swimmer *Surus*."

"Early in the year 1833, the London papers advertised 'that the long-talked-of project of communicating with America by steamboats was at length to be carried into effect. It was supposed that the *Great Western* would have been the first steamer to run to New York, but we find that the *Surus*, a powerful and well-built steamer of seven hundred tons, and three hundred and twenty horse power, commanded by Lieutenant R. Roberts, R.N., was to leave the London Docks on 28th March next, and Cock on 2d April, for New York."

"True it is the time thus notified, the *Surus* hailed out of dock, and sailed from off England. She was on March 28, 1833, touched at Cork, and after a tempestuous passage, arrived at New York at nine P.M., Sunday, April 22.

"The following correct extracts are taken from printed copies of the logs of both the *Surus* and the *Great Western*—in my possession—and reference thereto clearly shows the winner of 'The Race across the Atlantic.' 'The *Surus* left Cork at ten A.M., April 4, 1833, and arrived at New York on the 22d of the same month, at

nine P.M."—The *Great Western* left Bristol on the 8th April 1833, and arrived at New York on the 23d of the same month, at three P.M."

"The arrivals were the signal for great rejoicings and numerous entertainments on the part of our hospitable countrymen. I have now before me a copy of the *Weekly Herald*, New York, Saturday, April 22, 1833, which contains the following: 'The first steamer across the Atlantic—The *Surus*! the *Surus*! the *Surus*! Triumph of steam! Nothing is talked of but the *Surus*, she is the first steamer that arrived here from England,' &c."

"It is pleasant to remark, that all the entertainments given on this occasion by the good citizens of New York, the birth of our gracious Queen was joyfully proposed, and received with great enthusiasm. On the departure of the *Surus*, home-ward bound, a salute of seven-thirteen guns was given from the Battery wharf, a salute (the *Herald* states) of respect never before shown to the commander of a merchant vessel."

"Lieutenant R. Roberts was afterwards promoted while in command of the illustrious steamer the *President*, in 1841."

...quently lasts ten or twelve hours, giving out such red glow during the greater part of this time. When fresh fuel is added, the heat below is great that the coal burns like cannon coal, as it becomes a piece of red hot coke without losing its original shape, and the action of the air has retarded, it is consumed very to a fine ash. This is not the case in a fire without the chimney, as the cinders are frequently could down.

low combustion point from contact with the fuel. In lighting such a fire, if there were no chimney upon which to build it, the economizer should be drawn away for a little, but if there is a bottom of cinders and ash, the fire can be lighted without removing it. It is proper to mention that most of Mr. Todd's experiments were conducted with Yorkshire coal.

Mr. Todd cannot speak so confidently of the principle of the economizer as applied to steam-boilers, but he is decidedly so to the three main points achieved by its use in common household fires. These points are: (1) A saving of coal, (2) diminution of smoke, (3) abolition of cinders. By its use in his own kitchen fire, a saving was made of about thirty six pounds of coal per day, equal to threepence a day, and four pounds sterling a year. Not satisfied with his own experience, he wrote to thirty five persons who had tried the economizer. The thirty who sent replies almost unanimously decided that it saved coal, in one case it meant a saving of a ton in the kitchen fire in three months. The replies received to another set of queries as to what it gave out less or more heat, were decided in favour of 'more heat.' This second statement as to the diminution of smoke has not been so easy to prove, but from the more gradual and perfect

"Laid by Out"—In the article under this heading, which appeared in the *Journal* for March 1, the tonnage of the largest *Gloucester* steamers was printed as 457 tons. It should have been 427.

## ENSLAUGE

There has not for many years been a period in the history of agriculture when means of relief from depression were more urgently needed than in the present time. Rents are falling, and land is going out of cultivation, or becoming impoverished. In England, landlords have been offering land for no rent, and failing to get men to occupy it. All this, in a country which imports more of the necessaries of life produced by the land than all the other nations of the world, points to the urgent necessity of a move in advance in both the science and art of cultivation. Let readers should imagine the writer a pessimist, let them listen to the language of some of our leading agriculturists. Mr James May, farmer, Little Ythue, when presiding, more than a year ago, over a meeting of two thousand farmers in the city of Aberdeen, said 'Land is not only being worse cultivated, but in some cases it is going out of cultivation, our flocks and herds are decreasing by millions.' Mr James Caird read a paper, last November twelve months, on the land question, in London, before the Statistical Society, of which he is President, when he used the following language 'The land in this country has become less productive. To restore the condition of the soil of an old country is becoming more difficult and costly. As one generation follows another, more and more of the natural fertility is taken out of the land, and a corresponding higher rate of farming is required to maintain it.' Mr William Rindell, a well known Scotch farmer, read a paper, a year ago, before the Peeblesshire Farmers' Club, wherein he maintained that the land was rapidly becoming impoverished, and added 'Five quarters to the acre are becoming four, and four three.' All this is very serious, but it does not require second sight to perceive that the downward course is more likely to be accelerated than otherwise, unless some 'new dispensation'—as ensilage has been termed by one of its advocates—comes in to arrest the decline.

The primary cause of this decline in the fertility of the land has been the want of care on the part of its cultivators in not returning to it in the best possible state, the solid and liquid refuse of all the animals that are fed upon it produce. While farmers have allowed a vast amount of this to run to waste, they have relied on purchased manures for keeping up the fertility of the land. Some manures while they yield a crop for the current season leave the land more impoverished than when they were applied, and to this, that all our best portable manures are rising in price in the market, from the demand which exists for them in America and elsewhere. The Americans, by a vicious system of agriculture, have sorely tried the land, especially in the New England States, and are now, by the application of such manures as have bones for their base, doing what they can to restore its wasted fertility, and we cannot too soon learn the lesson their experience teaches. As it appears to the writer, nothing would more effectually restore the land of Great Britain to a high state of fertility than that of keeping a large increase of cattle and sheep on its produce, and the careful husbanding of their refuse under scientific guidance, till it is returned to the land in the best state of preparation for giving increased crops, and to this most desirable end the process termed *Ensilage* seems to point the way. The warmest thanks of the nation are due to Professor Thorold Rogers, M.P., for the able and exhaustive manner in which he has investigated the subject of ensilage, both in America and Europe, and for placing the fruits of his labours before the public in a volume, entitled, *Ensilage in America. Its Prospects in English Agriculture* (London: Sonnenschein & Co.), and which all who have the most remote interest in agriculture should procure and study at once, for we mistake much if a more important subject has been brought before them for many years. In reviewing the subject of ensilage at this time, we will avail ourselves of the stores of information in Professor Rogers's

book, and of the less exhaustive articles on the subject by other writers in various periodicals.

Ensilage may be defined in a few words as simply the placing of green herbage in a pit, which is termed a Silo, and in such position and circumstances as will first get rid of, and permanently exclude the destroying and corroding oxygen of the atmosphere. The silo is made either above or below the ground, or partly in and partly out of the ground. It ought to be as far as possible water-tight, and must be so constructed as to admit of great superincumbent pressure on the contents of the silo, this pressure being absolutely necessary to get rid of the enclosed air. The silo is intended for the storage and preservation of green forage, which may be either wet or dry, and if properly constructed, allows of the least possible change in substance of that which is packed in it. The object of its construction is to supply the stock feeder and dairy farmer with nutritious food for his stock, which can be secured independently of the state of the weather, and be convenient of access at all seasons.

Though the subject of ensilage has but recently come prominently before the public in its application to the conservation of green food for cattle, the principle on which it is founded is of old date. The *silviculture* of the German is but cabbage ensilaged. The writer, forty years ago, ensilaged green gooseberries by placing them in stone jars and glass bottles. When the bottles were full of the gooseberries, they were placed in suspensions of boiling water without their stoppers, for a couple of minutes, this rarefied and expelled the greater part of the air from amongst the berries, and just as the jars were taken out of the hot water, they were stoppered by means of glass stoppers, and waxed round the edges, so as to seal them up hermetically. When the air in them cooled to its normal state, the fruit was practically in *vacuo*, and there was but little of the destructive oxygen gas present. The bottles were then buried in the earth, to keep them cool during the summer and autumn, and at Christmas they afforded green gooseberry tarts. The jar here was the silo, and heat took the place of pressure, to get rid of the oxygen, as is necessary in the ordinary silo.

The practice of ensilage, so far as we can ascertain, took shape in France some few years ago; and M. Goffart published a work in French on the subject. This came under the notice of a Mr. Brown, an observant American traveller, who published an English translation of it in America in 1870. It at once attracted attention there, as being a valuable 'notion,' and especially caught the fancy of some of the New York merchants who have country residences. One of these, a Mr. Mills of Pompton, New Jersey, had made a discovery in the same direction for himself. The silos which he constructed in the first instance were of the rudest and simplest

description, mere holes in a bank; and when the contents were exhausted, he had them replastered.

After the translation and circulation of M. Goffart's book, the system spread rapidly in the state of New York, and in the month of January 1882, the landowners who practised ensilage held a conference on the subject in New York. The meeting was representative, and very enthusiastic. Samples of stored forage were exhibited, chiefly maize, clover, rye, and various grasses. Some of those present suggested the propriety of ensilaging nutritious fodder, such as rye and clover, together, in order that cattle might be fed on the product, without grain. Others recommended that pease, oats, maize, and rye should also be ensilaged together. Every one of those who attended the conference was convinced that the practice of ensilage would enormously increase the stock-bearing power of the land.

What proved at this meeting attracted the attention of Mr. Loring, who is practically the Minister of Agriculture in the United States, and he issued a circular containing twenty-six practical questions, all bearing on the subject, addressed to those only who were at the meet-

This circular elicited ninety-one acts of replies, all highly favourable, except that, while a few thought that horses did not do so well with it as other stock, others found horses do well on it. Our space will only admit of the insertion of a few of these replies to Mr. Loring's queries.

Number five says 'Ensilage is a more certain crop than hay. Twice as many animals can be kept on the same acreage. It is largely a substitute for roots. The labour of ensilage is much less than hay.'—Number six 'The profitability of ensilage lies mainly in the fact that it can be made to double the stock-carrying capacity of our eastern farms. Its advantages to dairymen are incalculable.'—Number seven 'It gives a vigorous and healthy appearance not seen in dry-fed cattle. It enables us to make milk and butter in winter as well as summer, and to keep our stock at half the expense of dry fodder. We can keep double the stock, and thus increase the fertility and value of our farms.'—Number nineteen 'The cost of feeding on ensilage is about hay, roots, and meal, is as one to three.'—Number twenty 'I think a stock of cattle can be kept for one-fourth the expense of any other method. I never saw cattle fatter on anything else.'—Number twenty-eight 'One acre of ensilage will keep eight head of cattle one hundred days. I am building three more this year.'—Number thirty 'I am keeping four times the stock with my silos that I have been able to keep heretofore.'

These are samples of the replies sent to Mr. Loring, and there is no room for supposing them anything but the honest convictions of the reporters. Accepting them as such, it must be evident to all who have any experience of the difficulty and labour that haymaking involves in our uncertain climate, especially in the case of low meadow hay, that ensilage is just the remedy for their difficulties, and even at this should prove its only advantage, it would still constitute a great boon. But this is not its sole advantage; it answers equally well, and is equally profitable,

for the saving of all forage in the best of climates. It avoids the desiccation and consequent loss of feeding qualities of the forage. It appears that the herbs which cattle will eat in a growing and green state, are eaten by them with equal if not greater avidity and with increased benefit in the form of ensilage.

Professor Harold Rogers had the following statement made him in America: 'As an illustration of the extraordinary increase of production and food supply from the adoption of the system, Colonel Wolcott told me that he was able by ensilage to keep four times the number of cows on the same acreage that he had been able to keep when he gave his animals green food in summer and hay in winter. Such was his experience in the year 1881, when a very protracted drought occurred. During this year, Colonel Wolcott put into his silo about seven hundred and eighty tons of green forage, being the produce of two crops from thirty-four acres of rye and maize, the latter being cut when the tassels were beginning to blossom and the ears to form. On this produce, he expected to feed eighty cows for twelve months, and when I saw him in September 1892, he did no doubt that his expectation would be realized.'

'Those farmers who do not adopt ensilage,' the cool-headed and dispassionate Colonel bluntly, 'will eventually be obliged to take the back seat'—a metaphor which, as the Professor here says, may be commended for its expressive force. He adds: 'Already some of the more ardent spirits are of opinion that, thanks to the slowness of the British agriculturist, and the economy of the new process, they [the Americans] will compete with him for fresh butter, as they have for cheese and to some extent meat.' One of Mr. Bourne's respondents states that he sold ensilage in the market town at from twenty-four to thirty shillings per ton, the cost of production being only eight shillings.

With regard to the cost and size of the silo, it will all depend on the circumstances of each case, and the quantity of fodder may be proposed to store. There are a great variety of forms and estimates given in the Professor's book, but they could scarcely be guides in this country, where wages and material differ so far from America, and as it may be presumed that farmers will procure and study the book for themselves, we pass by this part of the subject.

We have had Agricultural Commissioners sitting for years, and others just appointed, and it is questionable if the sum of all their labours will in any way approach that which ensilage is capable of doing to the food-producing power of the land of Britain. It is the only approach to a system that is calculated to make the farmer independent of the late and wet harvests that have wrought such ruin amongst them of late years. It is not a little humiliating to find that with the best grass-producing climate in the world, the United Kingdom should be so largely dependent on America and other countries for beef, mutton, pork, cheese, butter, and that abominable, oleo-margarine. The fact is, all who have any cultural skill, and who are not blind from prejudice, will agree with the present Earl of Derby when he said that the land of this country does not produce half of what

it is capable, if properly cultivated. Money is forthcoming for all manner of wild speculation at the ends of the earth, while the soil at our doors is lapsing into barrenness for want of capital skillfully applied.

Professor Rogers writes: 'If ensilage is profitable in England, what must the case be in Scotland! In the middle of November, snow often falls to the depth of several inches, frequently of several feet, the roads are impassable, and the fields with a root crop below, are stricken with barrenness. The Highland sheep, left to shift for themselves all every winter by themselves, while ensilage food would keep them alive and in condition till further aid. I believe that within a short time silos will be as common in Scotland as farms are now.' We hope he is a true prophet for it is evident that a change on the present routine of British agriculture is absolutely necessary. We must greatly reduce our land under grain crops, and correspondingly increase the production of stock, with which the competition from foreign sources can never be so fierce as in the case of grain.

Professor Rogers concludes the appendix to his interesting book as follows: 'I cannot help thinking that ensilage, for reasons of climate and soil, would be more fitted for the United Kingdom than it is for the American Union. They who practice it say it doubles the fertility of the soil at a stroke. I can conceive nothing which is of greater public interest at the present time than the restoration of English agriculture to its old courage and inventive activity, and it is the duty, and should be the pleasure, of every one who has seen a successful agricultural experiment in a distant country, to invite his fellow countrymen to examine what is new, which can be tried at comparatively little cost by hundreds of enterprising agriculturists, and is claimed by those who have had experience of it, as certainly satisfactory and profitable.'

It is gratifying to observe that the Highland Society is going to make experiments with ensilage on the estate of Mr. Macdonald of Portmahomack, Pictishhire. Success will depend on the grain fodder being properly spread out in the silo, and on such efficient and general pressure being brought to bear on it as will expel as nearly as possible all the air in the interstices amongst the fodder, after which the silo should by some means be sealed up from the air. When opened, it should be at one end of the silo, care being taken not to relax the general pressure, and the fodder should be cut away vertically as required, in the same manner as a hayrick.

If the system is as valuable as many represent it, the day will come when ensilage Companies may be started to supply galvanised iron silos, that may be sunk in the ground, with lids that can be pressed down by hydraulic or other pressure, and be fixed so as thoroughly to exclude the

\* It may be noted that, besides Professor Rogers's book, two other publications on the subject of Ensilage have appeared in pamphlet form—namely, *Ensilage: its Origin, History, and Use*, with *Experimental Trials and Results*, by Henry Woods, Norwich; *Ensilage & Co.* London; W. Rudway, and *Ensilage: A System for the Preservation of Food of Forage Plants and Grasses, independent of weather*, by Thomas Christy, F.R.S., London; Christy & Co.

air. These silos could be paid for by a certain percentage on their cost during the currency of a nineteenth years lease, and be valuable to the tenant-in-tenant on his leaving the farm.

Ireland has been in a state of Scotland with regard to the silage, for we read in the *Irish Farmers Gazette*, which publishes the official Report by Professor Caird, of the instance of Earl Spencer, as well as the model farm at Glanarevan, near Dublin. He says 'I am of opinion that the success of the continental and American farmers are sufficient to warrant our trying it on an extensive scale in those countries, and the success of some of our experiments at the Albert model farm at Glanarevan, strengthen my opinion on this point. Referring to the opinions adverse to the adoption here, I would suggest, first, as regards our cultivated plants, not being suited for ensilage, there can be no doubt that cultivated grasses are well adapted to the process on a large range of soils, especially peat. Italian ryegrass yields a large produce of dry, too—a crop which may be profitably cultivated on our poor cold soils—is well suited for the system. Again, it may be found that the costly system of sowing, may give way before the growing of crops for ensilage, as being more profitable.'

Professor Caird further states that he thinks the opinion that the silage is injurious to the horse, undergirded in silo is injurious to it, has been misapplied in too summary a manner. He further gives the results of analyses of green fodder, and the same after it comes from the silo, and it is singular how little they differ. The albumenoids are slightly decreased, and the soluble carbohydrates are increased. Thus we have really less indigestible matter left in the ensilage fodder than before it was put in the silo.

We now give in detail the experiments and their results, as tried at the Albert farm, simply remarking, that they seem to have been of a completely satisfactory character, the wonder being, that it succeeded at any time of them.

On the 28th of July the fodder was cut. Number one lucerne and straw chaffed (that is, cut by a chaffing machine), and put into a silo about five feet deep, and lined with boards, so as to make it air tight and water tight. [We doubt if the boards would do this.] Number two Comfrey and lucerne chaffed, and a very small portion of oat straw, into a similar silo. Number three Italian ryegrass not chaffed, but packed tightly into silo. Number four Italian ryegrass, not chaffed, packed tightly into silo, which was simply a put bag in the ground, without any protecting casing or lining. Number five Italian ryegrass, packed tightly on the surface of the ground, and covered with about eighteen inches of soil like a potato pit.

It must be admitted that if ensilage under such arrangements made an approximation to success, it was more than should have been expected.

On October 9, the silos were opened, and what follows was the result. In numbers one, three, and four, the fodder had a temperature of seventy five degrees Fahrenheit, it was apparently in good condition, having a smell somewhat like fresh brewers' grains. The cows on pasture, as well as those which were being housed, ate the food with avidity. Number two the comfrey and lucerne were quite spoiled, having an offensive

putrid smell. Number five Italian ryegrass, packed on the surface of the ground, was quite dry, but mouldy and unfit for food.

These experiments, more than any that have come under our notice, prove the value of a proper silo.

In England, Lord Walsingham brought the subject of ensilage under the notice of His Royal Highness the Prince of Wales at the last Norwich show, and Colonel Tomlins of Orwell Park had his silo open for the Prince's inspection. The subject is therefore being brought fairly to the front in England, and it is to be hoped Scotland will soon move also.

In speaking of ensilage a writer in the *Field* says 'The pits should be kept covered for at least six weeks, after which they may be opened in succession as required, and may be kept open till their contents are consumed by the cattle.'

Some valuable instructions on the subject of ensilage have recently been issued by the French Society of Agriculturists, and these instructions may prove of benefit to those who are engaged in having the problem solved here. Their advice is that ensilage should be recommended and advocated extensively, and their suggestions are to the effect that all forage, not excluding rushes or cut birch, is suitable for ensilage, that green forage should be ensiled without mixture of any dry substance, or even of salt, that the most favourable time for ensilaging is when the plants are in bloom, and that they should be stored when temperate.

## ONE LADY, BOTH FAIR,

OR, A HAND EVOT

BY JOHN S. HARRIS

CHARLES TAYLOR—'THE NEW YORK'

WITHIN the Bruton Street drawing-room the French Countess came gracefully forward, both of her exquisitely gloved hands extended, to greet her youthful hostess, who, on her part, seated back like a frightened bird. Nothing could be more appropriate than Madame de Laloupe's manner. Every gesture, every look, was perfect of its kind. Her whole bearing belonged to that highest art that cannot be distinguished from nature. 'I feel,' she said, in a tone of sweet reproach, 'that my visit is an unchronicled surprise. And yet—I will—I know the fragile character of friendship, alas, you seldom see. Yes, my dear madame, you seldom see. Oh, Mademoiselle, can it be that already you have learned the worldly lesson to forget, and that all our pleasant companionship—'

'What! you too—do you also come here to insult me! Why, else, do you call me by that name of Miss Carter?' was the petulant interruption to this smooth speech. 'I am Lady Leonora. Do you not know me for what I am? Your address, Countess Louise, to me is not that of a friend. I tell you, added the speaker, with quivering lips, 'that I am the Marchioness—and not—and not—that other one.'

'Now, my very dear young friend,' was the

soothing reply, couched in honeyed accents, of the foreign lady, 'you must not be angry, not vexed with Louise de Laloue, your old friend of Egypt. If she offends, it is for your own good, my child. To me, to my military years, to my larger experience, you are but as a charming child. It is the privilege of age, of course, to guide you, who are still in the threshold of the world. Now, but yesterday I was received at Leominster House, and saw your sister. She was looking very well, was our dear Clara, but perhaps—'

'This is unaffordable!' broke in Sir Pagans water, wringing her hands. She had for, then, in her attention, the pining duties of hospitality, but both were wated now, the young ladies on the sofa near which she had been standing, the visitor in the amplex of the old-fashioned arm chair, with her back judiciously turned to the tell-tale summer sun, but that point! thru the windows, even in London. Thus seen, Madame de Laloue looked remarkably well recovered, a grand, stately woman, with innocent all to eyes, and features that harmonized well with the marble complexion of her creamy complexion and the raven blackness of her hair. She was superbly dressed, almost without ornament, save a tiny antique jewel in dead gold, from some Cypriote or Phœnician tomb, but with all the skill that Worth at his will never display but in the hands of a valued customer—Spanish lace and Lyons silk and Genoa velvet falling harmoniously into their allotted places, like the notes and bars of music in the score of a competent composer.

'Our dear Clara received me in her London palace very graciously,' continued the French Countess, with an assumed a manner, 'though her first interview with Lady Leominster had not been a sympathetic one in Kensington Gardens, 'and as a friend, I have depicted me both in the moment of the edifying society of Lady Rubens, we could open our hearts to one another. Thus it was that the sweet young Marquise lamented to me the fact that her sister, so loved, was now separated from her, then it was that she craved of me the trifling service, willingly rendered, that I should call here in Ritten Street, at the house of your sister, Sir Carw, and should use my poor powers of persuasion to induce you, most refusal, at her loving prayer, to return to her, and be her sister and her friend again, that all might go on as naturally and as kindly as of other time.'

Madame de Laloue spoke very good English indeed, and her accent in especial was all but faultless, but she had the defect of thinking in French, and translating afterwards into our vernacular, and hence her speech occasionally lapsed into Gallicisms and turns of language. It was quite otherwise, it may be mentioned, with that other linguist, who had also come from Egypt on board the good steamship *Queen*, and whose nickname was Chinese Jack. He was one of those polyglot talkers who are possessed of the rare but valuable gift of thinking in any articulate tongue, living or dead, from Hebrew to Japanese, and therefore expressing his thoughts as a Malay, or a Persian, or a Spaniard would do, not as a cultured scholar with an elaborate acquaintance with the language would do.

French, or Russian? Of which nationality was the Countess? Both guests as to her dubious nationality were compatible with either supposition, since a Russian child of noble blood learns to keep from this care not her mother, but of her French, Swiss, English nursery-governess, never of her mother, cruel Russian nurse. There are races that furnish good names—the Hindus in Asia, the Negroes, the Europeans nations usually—not the Russians. Many a highly educated Russian, with stars on the breast of his uniform, many a noble and beautiful young Moscowite lady, shudders at the recollection of the baleful Grimaces that was as a shadow and a terror of their infancy.

Madame de Laloue, then, and what she had been prepared to say, very well and very prettily the immediate effect of her speech was that the golden-haired girl whom she addressed flung herself recklessly down upon the sofa and buried her face among the cushions. 'I cannot—oh, I cannot—it is too much ask!' she sobbed out wildly.

The Sphinx contemplated her with the serene scientific expression. Women have commonly a sort of frictionary with women, and a touch of real emotion rarely fails to stir their hearts. But the foreign Countess kept herself quite cool and sceptical. She took another chair, less heavy, and drew it towards the sofa. Then she laid her hand, with that light firm touch of hers, on the girl's arm. 'First, be calm,' she said, in strangely business-like tones. 'I know, I beg to say. All is not as it seems. It rests with me—*entendez-vous?*'—to let the curtain draw up and disclose a new scene. I am not here as the mere ambassador of Milioli at the palace of Leominster. I am no mouthpiece. I am Louise de Laloue, and I have come to make a proposition to you, and I beseech that, for your own sake, love, you will listen to me.

Slowly, very slowly, Sir Pagans beautiful young sister turned herself to him her recumbent attitude, and fixed her wondering eyes on which the time still swam, on the face of her mysterious acquaintance. As she did so, she looked so strikingly lovely, her golden hair thrust carefully back, her colour fluttering in her delicately rounded cheeks, that an Associate of the Royal Academy would have made his fortune by truthfully painting her portrait. As it was, Madame de Laloue, a keen judge, thought to herself, 'What raw material of beauty thrown away—these dupes and gulls of rascals!' and then, unthinkingly lowering her admirably managed voice, went on, 'I feel deeply for you, dear young friend, for you, and for the painful position, that every day must have a thorn the more. I—I am most anxious to help you, but, child, it is a hard world, and I, too, have had a rugged path to tread, and much regret to bear. If you would promise to be the friend of Louise—to remember what you owe to the lonely stranger, when she in her turn wants your aid, I might be of use. Through me—but through me only—your own little schemes, darling, might be forwarded. You might assume your sister's place, and be acknowledged, with the assent of all, as Nephewness of Leominster.'

'But I am the Marchioness of Leominster; I

an poor Wilfred's wife—widowed wife, it is that Countess, that you—you who know the world, so cruelly refuse to believe," answered the girl, half turning her head towards the cool, stately bearded foreign lady.

A smile of polite reserve lightly flitted across the face of Madame de Laloue—to vanish, however, as moisture vanishes from the surface of a mirror. It was very seldom that the Sphinx betrayed any sense of amusement. She was essentially diplomatic. Whatever she did was done of set purpose. Her grand, comely countenance was as grave as that of a judge about to pass sentence, one minute later, when she took the hand of the girl beside her, and said earnestly, "Let it not be a question of this between us two. Let us if we two are to be allies, at least speak openly and honestly between ourselves. Here, in this salt trade, there can be no need to mystery. You wish to leave Leominster House and Castel Vaur, and the great fortune—ah! how great!—and to be Miss de la Marquise de Leominster. What more natural! I am willing, and I think able, to effect this. Only, between us two considerers, as two friends, there should be no high morality, no question of abstract rights. We are behind the scenes, as it were, and should talk freely. Let the thing stand as it is. Nothing succeeds like success. Louise de Laloue is a good pilot through troubled waters. Let the affair be simply—the affair I may have—and I have—my own little wishes and objects, which I hope you will promote in return for what I shall do for you. But above all, let us be frank between ourselves!"

Here she was interrupted, as with a flushed cheek and flashing eye, the girl springing to her feet. "No, never, never!" was her passionate retort. "I will never admit, even to you, even secretly, that there can rest so much as the shadow of a doubt upon my claim and my right. What I profess to be, that I am, and not even in private will I yield an inch of my vantage ground, or go back from what I have said."

This was spoken with an energy for which the foreign Countess had severely been prepared. Madame de Laloue hid her lip, and her dark eyebrows contracted. Was it that she felt as if her pupil were growing dangerous, only headstrong, and might get beyond her control, to the detriment of her own interests, and the spoiling those eventual schemes of which her shrewd man from had made mention? An acute and practical judge of character, the Frenchwoman seemed to think that she had found that of her young friend by too conventional a standard. But while she looked frowningly on, the sudden outburst of excitement seemed to die away, and with a faint sigh and averted head the beautiful girl came back on the sofa, and hid her face, murmuring, as if unconscious of the listener's presence, "And yet, why not? What matter? What can it matter by what rugged roads I travel, so that I attain my end, and reach the goal at last? And yet I am so utterly alone! O that I had some one to advise me!" And she sobbed aloud.

Madame de Laloue's brow relaxed, and her smile came back to the lately stern and anxious mouth. After all, she reflected, it was better so, and gave tokens of a more malleable nature, and

was more fit to be moulded to her purpose. If *Mephistopheles* could be imagined in female form, Madame de Laloue must have looked very like the arch tempter of the German legend, as she sat there in her darkling strength, with her burning eyes surveying the fair drooping head, and an indefinable expression, that partook of the mixture of scorn and of grim humour, lurking about her firm lips. She waited—with the cruel patience of the angler, who lets the newly hooked trout tire itself before he touches the reel—until the storm had subsided, and then Sir Pagan's anger almost shuddered, as a light, strong hand was gently laid upon her slender wrist, and a soft voice said, curiously, "Let me advise you. You are groping in the dark, but I can point the way to safety and success. Do not refuse. The help I proffer is well worth the having. Louise de Laloue can be as ally as true as steel, and, believe me, the little experience you have gained in your short life is, compared with mine, but as a water-drop to the ocean. I have had harder diplomatic puzzles than this I solve, I can assure you, and have made my proof, as French duellists say, when pitted against mine formidable foes than any that I now expect to encounter on your behalf. That the help I offer is quick and unreserved, may I say, I do not for a moment pretend, nor, did I do so, would you credit me with being sincere as I really am. I am no descendant of Don Quixote, good! to redress wrongs and run tilt at windmills gratis. But I shall not be very exacting or unreasonable as to the expense, of which it is as yet too early to speak with precision. What I wish to impress upon you is, that if you take me for your guide, there must be no half-confidence, no drawing back. Obey my counsels, and you shall attain your object. The gates of Castel Vaur and of Leominster House shall fly open to receive you—not on sufferance, not as a dependant, but as mistress of all, and!"

"Give me time," pleaded the girl, speaking in a broken voice, slowly and hesitatingly. "I can not tell, I cannot decide. Give me time, dear Countess Louise, to think it over. Leave me now, I beg of you. I am not fit to talk in it, at present. My brain seems as if on fire. Let me keep your address. I will write—I will call. But now I cannot say, just at this moment, Madame de Laloue, I must have space for reflection. Only give me time!"

Graciously the French Countess rose to take her leave. "Think of it, my angel," she said soothingly and softly, "and think of me, whom a word will summon—like some Slave of the Ring, or of the Lamp, in that vision of the *Arabian Nights* that our Marquis de Golland brought into fashion—to your side. You thank me hard, sweet one, but you must not blame the oak because it is not as the willow. It is good, at any rate, for the ivy to cling to, something and supported by its rough strength, able to resist the tempest. There! I lay my card on the table. When you want me, I shall be here, always at your call." She pressed the girl's little hand, half pityingly, it might have been thought, within the grasp of that far stronger hand of hers, and then slipped silently away, without awaiting the usual formalities of leave-taking, as a housewife glides away on noiseless feet, passing like a tawny

shadow through the cane brake of the jungle and is gone. It used to be said in Egypt that the Sphinx was matchless in her cunning as in her entries, and seemed to rise and vanish as through a trapdoor. When the gull looked around her half timidly, she found herself alone.

## INDIAN WITCHCRAFT

There is scarcely any age or country in which a superstitious belief in witchcraft has not had a powerful hold on the minds of the people. In Europe, till about the end of the last century, the possession of magical powers and the practice of the black art were implicitly believed in, and the minds of learned divines greatly exercised to prove, by the aid of revelation, that the practice of sorcery was hateful to God and man. Since, in India, were therefore feared for its suppression, and the ecclesiastical authorities pursued with unrelenting vigour their self imposed task of punishing and extirpating those who were believed to live dealing with the Evil One. It need not, therefore, be wondered that amongst a large portion of the inhabitants of India, witchcraft in various guises exercises a vast and potent influence. The religion of the Hindus would naturally induce those who profess it to give credence to all kinds of marvels, but it will be found that even the followers of the Mohammedan creed are very nearly as much disposed to pin their faith upon the greatest follies, and to ascribe every ill invention which springs from the fears or the craft of their associates.

The followers of these religions need not go farther for their justification than their own scriptures. The Vedas enjoin special reverence for the Brahminical soothsayers, whose mantras or incantations are declared to have terrible effects; while the Koran, in its twenty first and twenty seventh chapters, dishes up a tale of the excellence of Solomon, and the power he possessed over all created things, even the elements, and the thirtieth chapter—said to have been revealed to the Prophet of Islam on the occasion of his having been bewitched by the daughters of a Jew—is still devoutly used as a charm against evil spirits and the spells of witches and sorcerers. The belief of Mohammedans in good and evil spirits who may be compelled to perform the bidding of a mortal, is not only manifested in their tales and legends, but forms also a subject of grave record, and is mixed up with their religious creed. While, on the one hand, they are taught to believe that there exist good angels who surround upon a man, and ever prompt him to do his duty to God and his fellow creatures, on the other hand, they are warned against evil spirits, who, with deadly malignity, pursue them every step and lead them into misery.

These spirits or genii constantly reside in the lowest of the seven firmaments, and are able to render themselves visible at pleasure to the human inhabitants of the earth. They are of various denominations, some good, and some evil, some very powerful and luxurious, and others reduced to such a low estate as to be compelled to live upon bones and air. And though these spirits are represented as superior to the human race in wisdom and power, it is commonly

believed to be possible for mortals to become allies of these intelligences, to partake their powers, and to assist their evil designs. Even further, the Hindu sikars and esangs, by the practice of austerities and self torture, are credited with having attained such a degree of sanctity and power that they could control supernatural beings. It is no uncommon thing at the present day for a person to resort to a fakir and obtain from him a charm for the purpose of removing an illness, as a safeguard against accidents, for the purpose of averting an impending disaster, or it may be with the view of causing some evil to happen to any one with whom they may be on unfriendly terms.

There are in India professed heart eaters and liver eaters, who by their spells and incantations pretend to eat away and destroy these vital organs, thereby relaxing the lukewarm individuals thus united to the greatest extremity. These extraordinary feelers are, it is said, able to communicate their art by giving those who desire to exercise this piece of liver eat to eat. They are dangerous people, effecting, as much mischief by their pretended power as if they were actually able to achieve what they profess, since they work upon the fears and excite the imagination of the unhappy individuals who are subjected to their diabolical influence, producing upon the victim—who is rendered by their handiwork by the awful suggestions of the enemy—anguish, disease, and finally death.

A recent Indian suit gave a very curious instance of the fatal results which arise sometimes from native superstitions. It was brought to light in the course of a trial held before the Agent of the Governor of Malacca at Grogam, in 8 with India. A petty dispute had arisen between two men regarding a sum of six annas (about sixpence) which had to be divided between them, and it ended in one of them going into a house and fetching a knife, with which he inflicted several stabs upon his opponent for the offence of which he died. On being taken up, the accused admitted having caused the death of the other man, but said he had done so in order to save himself, as the other had threatened to turn himself into a tiger and kill him. There is a superstition among the hill tribes to the effect that such a metamorphosis can be made, and coupling this with the circumstances that the crime was apparently unpremeditated, the weapon with which the wound was inflicted did not belong to the prisoner, the Governor's Agent did not consider the case such as to call for the exercise of the utmost severity of the law. The prisoner was found guilty, and ordered to be transported for life.

The Mohammedans adopt another device for taking away the life of an enemy—they construct an image of earth taken out of a grave, read a particular chapter of the Koran over it, and then repeat the prayers but with every word spelled in the same way—that is, with the letters reversed. These and other performances being accomplished, the image is perforated with wooden pegs in every part, and being shrouded like a human corpse, is covered with funeral solemnity to the cemetery of the place, and interred in the name of the person whose death is desired,

and who, it is believed, will not long survive the performance of these obsequies. Thus, happily, is not a very common occurrence now, as the English law in India would scarcely tolerate such proceedings, but there is scarcely an Anglo Indian who could not testify to having come across in his morning walk, (especially when two road-cross each other, the remains of a most incongruous collection of articles—a miniature human image in the centre, surrounded by earthen pots of variegated colours, containing rice, barley, and grain of other kinds, interspersed here and there by little oil lamps, placed in such relative positions to each other as it is calculated will have deep and mysterious consequences. To a stranger, this would present a spectacle which would be merely incomprehensible, yet it is but the simple and ordinary device of a credulous and superstitious people to seek relief from a dangerous or malignant malady from which one man or dear to them is suffering.

Charms and prophetary offerings are more relied on than medicines in sickness and pestilence, and this offering to the gods, accompanied with many prayers and incantations, is placed on the highway in the implicit belief that the malady of the person in whom they are interested will leave him and take to another, generally supposed to be the first person who comes across this magic collection of articles. Visitations of cholera are attempted to be warded by processions of village madonnas carrying garlands of flowers or other offerings to the god presiding over their hamlet. Some years ago, while cholera was violently raging in the Upper Provinces, a curious case was brought before the magistrates, in which the inhabitants of two neighbouring villages were charged with being concerned in a serious affair. The villagers of one hamlet made a miniature cart, and placing an image, so they supposed, of the cholera in it, they dragged it to the precincts of a neighbouring village, the inhabitants of which, having been forewarned, forcibly resisted the entrance of the unwelcome visitor. Still, however, the little cart got within their boundaries in spite of their wishes and efforts, they would not have risked all they had dragged it to another village, where probably a similar scene would have occurred.

■ My will be supposed this and so superstitious a people, love charms and philters of various kinds are believed to have wonderful efficacy, and some of these compounds are of so delicious a nature that persons partaking of them have been known to die from their effects. Some employ amulets for the purpose of captivating hearts, these talismans being constructed in a variety of ways—one being a tablet, on which is inscribed a magic square, and set as a ring or bracelet, others are written on thin plates of metal, or upon paper folded up and worn upon the person, while a third consists of particular roots, creepers, leaves, &c., gathered with many ceremonies, and tied up in small bags. The efficacy of these charms is based on the idea that certain objects and certain rites and ceremonies have an inherent or mysterious power existing in themselves of producing wonderful results. In Gujarat there are six descriptions of charms or *mantras*—the *mantra mantra* has the power of taking away life,

*mantra mantra* produces ocular or auricular illusions, *stambhana mantra* stops what is in motion, *akshaya mantra* calls or makes present anything; *manoharan mantra* has the power of entralling, and *ochakra mantra* of causing bodily injury short of death.

Perhaps it would be paying too great a compliment to even the most enlightened natives of India to suppose that they are wholly free from a superstition that attaches credit to the influence of the Evil eye. On some occasions, it is not proper to look at the party addressed, in case such an opportunity should permit an enemy to cast an evil eye, and it is against all etiquette to remark that a person is looking well or growing fat, since it may be supposed that such excellent condition may excite envy, and that the observation accompanied by a malignant glance would cause the object of it to dwindle and fade. ■ It is believed that a woman who is born upon one of a list of days laid down in the astrological books is a 'poison daughter' or gifted with the evil eye. Such a person is called a *dashu* or witch, and it is supposed that those on whom she casts her eyes suffer as if they were poisoned by evil spirits.

In India, no less than in other countries, there has existed, and still exists, a profound belief in the existence and evil influence of witches. Though not very frequent now, at one time cases were brought continually before the magistrates of complaints preferred against reputed sorcerers or witches for damage done in various unlawful ways, and sometimes by the poor creatures thus accused, who were attacked and cruelly used by those who had frustrated themselves with them. At the Agré season, some years ago, a case of this kind was tried, in which the defence set up was as follows: That the accused was an enchanter, who by the power of his magic could render a person blind, or could afflict him with serious illness, in which latter case, in the relative supplying him with such sums of money as he demanded, he would again restore the patient to his wonted health and strength. He in this manner extorted money from all, and usually ruined many of the inhabitants, who, from the awe in which they stood him, never dared to refuse compliance with his demands, however exorbitant, and were afraid even to lodge complaints against him in court. He was banished from the village, by order of a Panchayet, under a universal permission that he pursued witchcraft to the great detriment of the people in the neighbourhood, and was not heard of until six months before the commission of the outrage against him, when he returned to the village, and again commenced the performance of his diabolical arts. 'My son's wife, son, and father,' continued the witness, the mother of the prisoner, 'all fell victims to his fatal spells. He came to our house this morning, and sprinkled a few ashes over the prisoner's father, pronouncing, in an intonation at the same time, and the latter fell down lifeless. My son having witnessed this act, implored him to restore his father to life; whereupon he threatened him also with immediate death, and quitted the house. On this my son rushed out upon him, dragged him back, and killed him

by repeated blows on the head with a flint stone.

Other witnesses were called who spoke to the good character of the prisoner, who was much esteemed in the village on account of his mildness of disposition and peaceable demeanour, and on their further examination, they uniformly deposed that the deceased was a peaceful craftsman, who practised sorcery, to the serious injury of the community, instances whereof by his magic spells he had caused their cattle to fall lame, and wasted money from them under the terror which his fearful reputation had inspired. The prisoner was found guilty of murder, and liable to punishment accordingly, but in consequence of the strong protestation he had received, and the suddenness of the act, perpetrated under the conviction that the persons dear to him had been destroyed by spells, in the efficacy of which he implicitly believed, the court commuted Nicholas Sawlata's sentence into a term of imprisonment, and sentenced him to three years imprisonment.

Persons suspected of being witches have been occasionally subjected to very cruel treatment, especially if the ordeal to which their neighbours have recourse should convict them of the crime. In India, as well as in Europe, it is supposed that a witch will float upon the water, but there are other tests by which their acquaintance with the black art may be proved. Oil poured in a heap, with a little rice, forms one of these trials; should the oil run through when the names of the accused are called over, their guilt is established. Similarly, there are numerous oracles by which a thief may be detected, the one most commonly practised being that of evoking the suspected parties to chew rice, in operation which however easy to those who have nothing to fear, becomes difficult to the conscious delinquent, whose mouth, parched and dry, refuses its function, and upon examination, the rice is found whole. Another contrivance, which I have considered the most efficient method of catching thieves, is to write the names of the persons present, with those of their fathers, in a square, drawn upon separate pieces of paper, these are to be folded up and enclosed in boluses made of wheat flour. A lot of these boluses filled with water, and all the boluses thrown in, the ticket of the thief will come up and float upon the surface.

## BENJAMIN BLUNT, MARINER

### IN THREE CHAPTERS.—CHAPTER I.

'SHE still sleeps. How softly and evenly she breathes—like any little child! It had not been for dear old dad, she would be dipping fashions deep among the sand and shells at the bottom of the sea. Once she smiled and murmured some one's name—her husband's. She must love him very much, or she would not snuggle and talk about him in her sleep. I wonder whether I love Phil enough to talk about him in my sleep! I know I often dream about him.'

Speaking thus to herself, Ruth Mayfield softly closed the door of an inner room, and went on

with her preparations for breakfast with as little noise as possible.

She was a pleasant-faced, sun-browned girl of nineteen, with dark sunny eyes and a wealth of wavy chestnut hair that fell as if it had been ruffled by many a sea breeze, and it would never come quite smooth again. She was the adopted daughter of old Benjamin Blunt, coach owner, and I know not what level, in the little fishing hamlet of Dunrobin Bay. A very pretty picture Ruth made this morning, sitting so demurely and quietly about her household duties, with a dark blue gown, her white apron, her snowy collar with a tiny bow of blue ribbon at the throat, and with a fine pink and a spray of southernwood fastened in the bosom of her dress. Under ordinary circumstances, she would have been singing while doing, but at her work but there were reasons why she should not sing this morning.

How her humble the house of Benjamin Blunt might be, there was about it in its tiny nook comfort to win many a more pretentious dwelling could lay no claim. And then it was all so daintily clean, from the quaint little round table that glinted on the chimney piece, to the well-scoured uncarpeted floor, in which a dirty footprint would have seemed a perturbation.

The room in which Ruth was living, not by itself, was kitchen and sitting room in one. At one end of it, a door opened into a garden and scullery, and at the opposite end another her open into a little parlour, a sort of nursery apartment, which was never used above a dozen times a year. Old Blunt was proud of his parlour, but he never cared to sit in it, and Ruth was like-minded in the matter. Two other doors opened into the kitchen, for the cottage was only one store high. The room had two lined low, diamond-paned windows, each of which had a softly cushioned seat, on which it was pleasant to sit, especially on warm summer afternoons, when the little was singing, a tune it still in the hole, and the parrots were pulling on the kith, when through the open window came the mingled scent of many flowers, and the soft humming of bees, with, perhaps, the faint lap of the sea on the rocks, as it came tumbling and chattering up the sandy roads.

The front door of this room opened into a small porch, which in summer time was covered with flowering creepers. From the porch you stepped into a wilderness of a garden, where mint and thyme and marjoram and many herbs and pulley were mixed with pink and white and sweet williams and pansies, with blue and roses of many kinds, in an inextricable confusion that would have been enough to drive an owl or a raven mad. From the porch, a path led to a wicket gate, which gave access to the high wall on the opposite side, which, a shelter, shut out the light from the garden, and so to the rear of a boundary beyond.

On this particular morning, with all the sun was shining brightly, and the air was that of early summer, the elements were low, but Ruth's fire would not have done discredit to December, for a sharp frosted wind was whistling round the cottage last night's had not quite blown itself out, and all the world

waste of waters, as far as the eye could see, was still a scething mass of angry, white topped waves.

Presently the little green gate was opened by a stalwart, bronzed, good looking young fellow, dressed in the blue jersey and high boots of a fisherman. His name was Phil Gaylor, and he was Ruth Mayfield's sweetheart. He walked leisurely up the public footway, smiling at a flower here and there, but the booming of the tide on the beach denuded the sound of his footsteps, and Ruth did not hear him. He laid his hand on the latch, and then apparently changed his mind. Crossing to one of the windows—the one opposite the fireplace—he stooped, and peered through the panes, shading the light from his eyes with one hand as he did so. Ruth was bending over the table, with her back to the window, and did not perceive him. He smiled, and his eyes lightened as he looked. Presently he gave two quick little taps on the glass with his fingers. Ruth started and turned, and shook a warning finger at him, when she saw who was the culprit. Then coming to the door, she opened it very gently.

'O Phil, how you startled me!' she said. 'Do your roses always come out like that Ruth, when you are startled?' he asked, and with that, this bold young fisherman drew her to him and kissed her, which made the roses on Ruth's cheeks turn from pink to red.

'Is the Cup at home?' asked Phil as he pinched a spray of honeysuckle off the porch.

'No, he had his breakfast two hours ago, and went out.'

'I didn't see him as I came along. I've got a message for him, but I dare say it will keep till he comes back—How is the poor lady who was I thought her last night?'

'She is in bed, fast asleep.'

'Plenty of sleep's the best thing for her. But mayn't I come in?'

'Yes, if you will be good and promise only to talk in a whisper.'

'I will be as good as gold, and you know I always did like to talk to you in a whisper.'

So Phil was allowed to enter. He walked him self on a three legged stool by the chimney corner, where he had spent many happy hours already.

'Ah, Phil, how frightened I was last night!' said Ruth, as she handed her sweetheart a steaming cup of fragrant coffee.

'Frightened, dearie—at what?'

'I had I not enough to frighten me, when you and dear old dad were out together in that terrible storm, and I not knowing from one minute to another what might happen?'

'A capital of wind—nothing to make a fuss about.'

'How can you talk in that way, Phil? I have lived here too long not to know that when wind and water fight together as they did last night, we are sure to hear of some poor creatures whose homes will never see them again. Square Titcombe himself said we had not had such a storm for four winters past.'

'Square Titcombe's no better than an old woman.'

'Ah, Phil, you can't deceive me in that way. I had just laid the cloth for supper, and was

listening to the noise of the wind and the sea, which seemed to grow more deafening every minute, and was wondering why dad did not come in, when I heard the boom of a gun. I knew what it meant, and for a moment my heart seemed turned to stone. I put aside the curtain, and was peering out into the darkness, when dad opened the door. He looked so quiet and resolute, and had such a bright brave look in his eyes, that I knew something was about to happen. The first thing he did was to get out his water-proof coat and leggings, and his old sword wither. While he was putting them on, we heard the gun again. 'Won't you have some supper, father, before you go out?' I asked. 'No, not now—not till I come back,' he said. Then he took both my hands in his and drew me to him and kissed me twice very tenderly. The tears came into my eyes, but I bit my lip and kept them back. I should have plenty of time to cry when he had gone. 'Don't get downhearted, little one,' he said. Then he squeezed my hand very hard, smiled, patted my cheek, and was gone. As he shut the door behind him, the gun sounded again.

'It seemed terrible to be indoors all alone. Presently I drew aside the curtain and put the lamp close to the window. I knew it could be such a long way out to sea, and I thought that maybe dad might see it from the boat, and that it might hasten him on in what he had set him self to do. Then I put a shawl over my head and went down to the pier, but I had to hold on tight, or the wind would have taken me off my feet. After a time, some fishermen came by with lanterns. I talked to them, and they told me that a small schooner had struck on the bar, and that in another hour she would be all in pieces. And one, 'The Janet,' gone out to the wreck with her old Ben and Phil Gaylor and half a dozen more. It was a bad night to be out in, but neither wind nor weather ever stopped Ben Blunt when there were lives to be saved. Then they went on and were lost in the darkness, and I heard the gun again. After a while, I found myself kneeling down by the lamp at the window, with my shawl over my head, to listen the din of the storm, praying to heaven to bring back my dear ones safe and sound. Then all at once there was a great rush of wind, and the lamp was blown out, and I there in the doorway, by the dim fire light, I saw you and dad standing with something white in your arms—and I felt nothing, only that both of you were safe.'

Although Ruth had spoken in tones that were scarcely above a whisper, there was a heightened colour in her cheeks as she ceased. Phil gazed at her in undimmed admiration, and indeed he will say, 'It

'They have found out who the lady is,' he said presently. 'They say that her name is Lady Janet Trevor.'

'Lady Janet Trevor? Why, dad's boat is called the Janet, and dad was the man who saved her!'

'That he was. If he hadn't said that he was going out to the schooner in his little Janet, and called out for volunteers, every soul on board the ship would have been lost.'

'Brave old dad! Nobody but himself knows how many lives he has saved.'

'He has one medal already from the big Society in London. Perhaps they'll send him another last night's work.'

'And my life, Phil, was one of those that he saved. I always remember that in my prayers.'

'The night he saved you, dearie, he found a daughter.'

'And I a second father.'

'If he was your real father, he couldn't love you better than he does.'

'Who knows it, Phil, better than I do? And my love and duty and obedience are all his, and will be as long as I live.'

'Not all the love, Ruth—not quite all.'

'You and he between you have it all—every moral.' Then she put into his hands a slice of bread and a toasting fork.

Phil knew what was expected of him. Kneeling down on one knee and shaking his knee from the fire with his left hand, he set to work. But one can make toast and talk at the same time.

'I'm going into Drepdale this afternoon,' he said, 'to buy something towards housekeeping. Guess what?'

'A looking glass, perhaps.'

'A woman's best thought. Guess again.'

'A teapot.'

'No, my dear, no.'

'I give it up.'

'What do you say to a set of polished silver and a hairbrush?'

'Phil! Only don't turn the toast.'

'Ay, and the butter, is a hairbrush, and no mistake. I've had my eye on it for a long time, and now I've made up my mind to buy it.'

'Will it cost much money?'

'Not when you consider the pattern. Fancy! in the middle a great big sunflower, and little can flowers all round it, with a border of pink daisies. A sort of hairbrush that seems to be handed over to put your feet on. You feel as if you wanted to sit it a distance from it, and keep on admiring it over so long.'

'Why, that won't be its equal in the village.'

'I should think not, indeed—then that's a tea tray as I've set my heart on buying—a Sunday tea tray.'

'A Sunday tea tray, Phil?'

'It's a splendid work of art. I can tell you, only fit to be brought out on Sundays and bath days, and when there's a company to tea.'

'But what is there painted on it, Phil?'

'A young woman and a young man—as it might be you and me—a walking, along a zigzag path, all among the daisies and buttercups, to a church right up in the left-hand corner of the picture. You can tell the church is a long way off, because the steeple's no higher than the young man and the young woman. They're sweethearts, that's what they are—just like you and me. You can't see their faces, because they're going towards the church, but you can tell from their backs and the way they walk along, that they can't possibly be anything but sweethearts. Anybody can see they've been having a bit of a tiff—not like you and me, Ruth. But there's a stile half a mile farther on,' continued Phil, 'as he rose to his feet and handed the toast to his sweetheart, and what's the stile there for, I should like to know, if not to give them a chance of kissing and making it up—just like you and me.' And

sending the action to the word, and before Ruth divined his intentions, she was a prisoner in the strong arms of the young fisherman, and his lips were pressed to hers.

At this moment, the door was opened, and before Ruth could relieve herself, there stood Benjamin Blunt, his face the broad smile. He was certainly no son of And, indeed, as fisherman go, he might be accounted a little man, but what there was of him was nearly all muscle and sinew. He carried his sixty years as though he were not half that age. His hair clear-cut aquiline features, and his blue-gray eyes were as keen as the eyes of a hawk. Advancing years had grizzled his hair and beard, but they still smiled as naturally as they had smiled when he was a youth of twenty. In his younger days, no more daring or skillful harpooner had ever sailed for the Greenland sea. Yet, through all the ups and downs of an adventurous career, he had preserved intact a certain natural freshness of heart and simplicity of character which rendered him to all who came into his contact with him.

'Yo ho, yo ho, my heartie! he cried in a cheery voice, 'is this the way you carry on when the ship's a back-timer? The sooner you two get married, the better. Matrimony is the only cure for live marking. Before you're wedded, you young folk think you can't be enough of each other. By the time you've been married six months, you'll turn up your noses at one another, and think what fools you were not to keep single for another dozen years.'

'You might have tried matrimony yourself, Cyp, you can't know so much about it,' said Phil, with a shy glance at Ruth.

'Humph! Not such a nursery. Look at me—I was a young bachelor—my own master, and I with half the girls of the village in my power.'

'The gay young spark will be enjoying one of these days, Phil, and be bringing home a stepmother younger than myself. Won't I lead her a life?'

'We must buy him a pair of yellow gloves to go counting in.'

'And a walking stick with a silk tassel.'

'And a pair of shiny boots—a tip-top swell and no mistake.'

'Hush!' said Ruth suddenly. 'We are forgetting all about the poor lady.'

Ben had been looking from one to the other with an anxious smile, but the smile died from off his face to be said 'Ah! how is she by this time, I wonder?'

'When I peeped into the bedroom a little while ago, she was fast asleep.'

'That's her best physic. She'll wake up as lively as a porpoise.'

'They do say as how she's a real lady,' remarked Phil.

'A real lady? Why, my auntie could see with half an eye that she's a real lady.'

'Ah, but I mean a lady with a handle to her name—what they call a lady of title.'

'Lady Janet Trevor,' put in Ruth, in a tone in which admiration and awe were very finely blended.

'What name did you say?' a loud Ben with a start.

'Lady Janet Trevor—at least, that's what Phil called her.'

'Lady-Jane-Trevor,' he said, dwelling on each syllable, as though dexterous of committing the name to memory.

'Funny, isn't it, dad, that both the lady and the boat in which she was saved from the wreck should be called "Jane"?'—

'Oh, very funny, my dear, very,' he replied, not without a touch of pathos in his voice. 'I could almost link which I think of it.' He rested himself in his armchair in the corner, and, resting his hands on his knees, sat staring into the fire.

Phil turned to Ruth. 'The lady's husband's down at the *Three Croons*. He got his arm badly crushed by a ship last night. I want this morning to see him, so he was. I told him the lady was all right, and the doctor says he may come up and see her as soon as his arm is better.'—

'The gentleman coming here?' exclaimed Ruth in dismay.

'Why not? Ben Hunt's cottage is good enough for any gentleman to put his head into.'—

'You don't understand. The parson just dived, and there's not been a fire in it for six weeks. Don't, dear!'

Ben's lips were moving, he was talking to himself. 'Another I met under my roof! How the *Pink* comes back again!'

A meaning look passed between the young people. Phil turned to the old man. 'And there's a gentleman, Cyp, as wants to see you,' he said—'a gentleman with an eye-glass and an uncommon rough kind of hair—just as wears all arms and legs—who rushes about, asking questions of everybody, and puts down the answers in a little book. He says he belongs to the *Deedle* newspaper, and he wants to know all about the wreck.'

'Fifty he won't about the schooner, he'd have known enough about it then,' replied Ben, rousing himself from his abstraction for a moment and then relapsing into it again.

'He asked me what was the *whomper's* name,' continued Phil, 'and when I told him *Jill* dived and cockatoo, he put it down as serious as a judge.'

Ruth whispered to Phil, 'Try to rouse him and get him to go out with you. He's got one of his melancholy fits coming on.'

'And there's another gentleman, Cyp, at the *Three Croons* as wants to see you,' said Phil in answer to the appeal, as he laid a hand gently on Mr Hunt's shoulder, 'not the lady's husband, but another. He hasn't much time to spare, because he says he must catch the eleven o'clock train from *Deedle*. Won't you come, Cyp? The gentleman will be waiting for you.'

'Oh, what gentleman?' asked Ben, lifting his head with a vague faraway look in his eyes. 'Ah, now I recollect. Let me go down and see the gentleman. Perhaps he won't mind giving half a sovereign for poor *Jane's* widow and little ones.'

'The morning's cold, drink this before you start,' said Ruth, proffering a cup of coffee.

Ben took it without a word, but as he sipped it, he said, 'I think, my dear, as I'm going among the gentry, I ought to put on my stud-up collar and take my umbrella. I should like to appear respectable, you know.'

'Just as you like, dad. But they would think no better of you than they do if you were to wear twenty stand-up collars.'

'But I don't want to wear twenty—I only want to wear one,' he replied a little positively. 'I hope you made it safe, my dear, because there's nothing more uncomfortable than a stand-up collar won't stand up.' There was a humorous twinkle in his eyes as he spoke thus. To all appearance, his anxious mood had vanished as quickly as it had come. Presently he put down his cup and saucer. 'It won't take me more than a minute to tidy up myself,' he said, and with that he went off into his bedroom. And indeed to our point of view it seemed no more than a minute before he was back again, although in reality it was nearer ten.

It was while they were sitting alone together, that Phil suddenly thought himself of something he had hitherto forgotten. 'My stars and little fishes!' he exclaimed, 'what a memory I must have!' Speaking thus, he dipped his hand into a side pocket and produced therefrom a pocket with a broken chain attached to it. 'I found this pretty thing in the bottom of the box, this morning,' he said. 'It can't belong to my father, but Lady Janet. You had better give it to her, Ruth, when she wakes up.'

Ruth took the precious trinket, and turned it over and over admiringly. 'Aunt is pretty, Phil? she said. "An' so, it opens" and here's the likeness of a lady. What a beautiful face! But how old-fashioned she is! dived!' It must have been taken years and years ago. I'll give it to the lady when she gets up.'

She was in the act of putting away the chain and locket on the chimney piece, when Mr Hunt re-entered the room. In place of his fine and easy turn-down sailor collar, he had donned a stand-up shirt, very high and stiff, and his very evident discomfort. In one hand he carried a small old-fashioned metal box, a silk pocket-handkerchief of a striking pattern, and a pair of black kid gloves, and in the other hand a gruff and unattractive of a decidedly busy *Clanman* appearance.

'Now I've got my collar on, I can't help thinking it must be beautiful,' he said. 'I've actually caught myself a looking once or twice for the bell, and I was going to put my *Prayer* book in my pocket quite natural, when I bethought myself that it wasn't Sunday at all—Just took this in some where when it will be seen,' he added, as he brushed the sleeve to Ruth. 'Old Mr. Rudd hit it me when he dived. It's got a look of Rudd's hat in it.' Then, while Ruth was pinning the brooch in the button of his shirt, he turned to Phil. 'He was quite kind, was Rudd, for many years before he died. He used to wash his head every morning with the best old Jamaica rum, to try and bring his hair back, but it wouldn't come. At last he took to drinking the rum neat, but he kept bald till the day he died. Poor old Rudd! His last words were "Just rub your head up o my head, Ben, I feel as if the hair was coming out."—That'll do nicely, my dear'—thus last remark to Ruth. 'And now, just put this handkerchief in my pocket so as to have it hanging out behind. Now for my gloves—I never wear 'em, you know, Phil. I couldn't get 'em on, was it to save my life, but

I carry 'em in my hand, and people think I've just taken 'em off—Now for my umbrella. It isn't often as I go into company, but when I do, I like ■■■ to be respectable—Good bye, poppet,' with that ■■■ kissed Ruth and patted her lovingly on the cheek. 'We won't be long about we're back—Now, Phil!'

Phil was quite ready. 'Morning, Ruth. See you again soon long, he said!

'Yes, yes, we must try to get half a sovereign for poor Jim's widow and the young ones,' said the older man to the younger as they crossed the threshold.

Ruth crowded in the window, and watched them go down the gutter pathway and turn to the right, on their way to the village. Phil gave her a farewell look and a wave of the hand.

'There's not a man, woman, or child in Duncroft that isn't proud of Juan Blunt to-day,' she said to herself as she went back to her duties. 'Lovey! There's the blubber lips cheering him as he goes down the street. They'll all grow up braver and bolder for having a man like dad living among them.'

# THE ETIQUETTE OF COURTS.

An old custom of the Spanish court requires that when a baby is born in the royal family, it shall be officially announced that a 'vigorous' infant has come into the world. The queen of Spain having become the mother of a healthy child which lived only two hours, the Court Journal chronicled the birth and death in the usual way. 'His Majesty was delivered at three o'clock of a vigorous infant, who died at five.' The *Times* of Madrid lately reported that the town council of Sevilla, having had an interview with Alfonso XII., 'kissed the feet of His Majesty, and withdrew.' It is not to be supposed that the councillors actually went down on all fours and kissed the king's boots as if he were the Pope, but that etiquette demanded that they should be said to have done so, because a town council does not stand on the same level of dignity as the Cortes, whose members are supposed to kiss hands when they take leave. The three letters B S P (*breve sus pies*), which mean, 'I kiss your feet,' are still used by gentlemen in Spain when signing letters addressed to kings, and by subjects to their king. The letters L S M (*breve sus manos*), which are used by men writing to men, and by ladies to ladies, would seem too cavalier from a gentleman to a lady, and downright impertinent from a subject to his sovereign.

One of the chief reasons of the Duke d'Aosta's unpopularity during the brief reign which he closed with a voluntary abdication, was, that he would take no pains to study the complicated etiquette of the Emperor, but sought to introduce simple manners in a country where even beggars drape themselves proudly in their tattered mantles and address one another as 'Señor Caballero.' He one day told a mulatto, with whom he had stopped to talk on a country road under a breaking

sun, to put on his hat, forgetting that by the act of ordering a subject to cover himself in the royal presence, he recalled him a Grandee. Marshal Prim, who was standing, by, hastily knocked the mulatto's head down out of his hand, and set his foot upon it, at the same time offering the man some gold, but the mulatto, who was mortally offended, spurned the money, and a few days later, when Prim was assassinated, a rumour was circulated among the people—but without truth, ■■■—that the mulatto had avenged who had narrowly missed becoming a Grandee, was an accessory to the crime. On another occasion, King Amadeo, inconsiderately addressed a groom of his in the second person singular as *tu*. Happily, the man was an Italian, for, as a court chamberlain represented to His Majesty, a Spanish gentleman to wish thus familiarly might have claimed that the monarch had dubbed him *camacho*—that is, had ennobled him. Another thing which the much-wounded Italian Prince had to learn was that a Spanish king must not sign any letter to a subject with any friendly or complimentary formula, but must simply write *Yo Fecho* (I the King).

Etiquette is the code of rules by which great people keep their names in proper respect. Prince Demetrius when a boy was rebuked by his father for speaking of the king as 'this' or 'that' to speak recently of His Majesty, said the old Prince of Varna, 'and you will grow accustomed to think of him with veneration.' Young Bismarck but the same to do in it, and to this day the great Chancellor always lowers his tone and assumes a grave worshipping look when ■■■ alludes to the Kaiser. If a message is brought to him from the Emperor's word of mouth or in writing, he stands up to receive it. When a wedding takes place at the Prussian court, it is the privilege for all the state dignitaries to form a candle procession—that is to say, that ministers, chamberlains, high stewards, take each a silver candlestick with a lighted taper in their hands, and conduct the bride and bridegroom round the billroom, where guests are assembled, and thence into the Throne room, where the pair do homage to the sovereign. At the first royal wedding which occurred after the Chancellor had been promoted to the dignity of Prince and Minister, Bismarck failed to appear in the candle procession, and court gossip quickly concluded that he now thought himself too great a man to take part in a semi-religious ceremony. The truth was, however, that the Chancellor had been cured with a sudden attack of gout, and at the next wedding he was careful to silence all curiosity by carrying his candle bravely like other ministers.

Prince Gortschakoff was always equally careful to observe the minutest points of etiquette in his relations with the late Czar and the imperial family. Lord Dufferin, asking him whether the Emperor's cold was better, was rather struck to hear him answer in a reverent tone, with his head bent and his eyes half closed. 'His Majesty has deigned to feel a little better this morning.' The Duke de Morny said of Gortschakoff that he seemed to purr when he talked of any creature at court, even of the Grand Duchess Olga's monkey. But possibly this importunate obsequiousness is appreciated by the rulers of this

earth, for Gortschakoff resumed prime minister throughout the whole of the late Emperor's reign.

The etiquette as to the precedence of ambassadors in court was happily settled once and for all by the Congress of Vienna in 1814, which decided that ambassadors and ministers were to take rank by seniority according to the date of their appointments. By courtesy, however, the representative of the Pope is always allowed to hold the first place in the diplomatic body and to act as its spokesman. Before 1815, the wrangles between envoys about precedence were incessant, and the servants of royal legations very often came to blows and blood-shedding to determine whose or who should go first in a state pageant. In 1818 the French artist Ingres having been commissioned to paint a picture of the Congress of Aix-la-Chapelle, was sorely exercised in choosing his plumpiest models so as to offend none of them. He was particularly perplexed in settling who was to be the central figure of the picture. Prince Talleyrand, the representative of France, marked out having the place of honour, and Ingres, as a Frenchman, desired to give it him. On the other hand, the sister of the Congress was the Duke of Wellington, and Talley, being a conventional worker, wanted his picture to be historically as well as artistically correct. At last he hit upon the really happy thought of putting Talleyrand in the centre of the group, while making him and all the other plenipotentiaries face towards the door to greet the Duke of Wellington, who was walking in. Nowadays, diplomatically, there is no longer so touchy about the places they are to fill in language and picture, still hold tightly to some privileges which are hardly in keeping with the spirit of the age. Not only envoys themselves but their servants too live from court in the countries where they reside, and an escort committed on an envoy's errand is regarded as an envoy's donee to the envoy himself. It was only fourteen years ago that Baron Thiers, being French minister to Madrid, wrote indignantly to his government 'I have this day received a kick in the back of my servant.' The servant had been molested during the note that followed the overthrow of Isabel II, but an apology and fine were demanded pretty much as if the minister himself had been kicked.

It is in consequence of the minute etiquette which regulates the intercourse of crowned heads with one another, that sovereigns when they pay private visits to other states are said to travel incognito. By doing this, they avoid the pompous receptions, the firing of guns, &c., to which they would have to submit if they journeyed under their proper titles. When the Queen goes to the continent, she is called Duchess of Lancaster, and foreign dignitaries who approach her are expected not to address her as Your Majesty. This rule of etiquette is not always observed, but those who think that they are doing honour to the Queen by transgressing it are quite mistaken, for to ignore a sovereign's incognito is to be guilty of a piece of rudeness which would be promptly rectified if committed by any person who was supposed to be in a position to know better. It makes an enormous difference to egotism, ladies in waiting, and maids of honour, whether they are travelling with a Duchess or a Queen. A Queen must not be spoken to unless she first

speaks, and persons ought not to speak to one another in her presence. Nobody can sit down in a room where the Queen is without being requested to do so, in the open air, men must remain bareheaded when addressed by Her Majesty, and must not come nearer than three paces to her person. All these rules are relaxed when the Queen travels in some less august capacity, and then the ladies and gentlemen of her court behave in her presence as they would in that of any other lady.

The man who would be perfect in the knowledge of court ways has a great deal to learn about the times and circumstances when he may or may not do this and that. Two seasons ago, during a garden party at Buckingham Palace, an American couple caused a sensation by pushing forward and shaking the Queen's hand. They might have done this without any great impropriety if they had met the Duchess of Lancaster at Nice, and indeed when the Duchess of Lancaster holds out her hand, it would be a solemn invariance to kiss it as if it were the hand of a queen.

There are things in the etiquette of courts which may seem insignificant to most people, but are by no means so in the eyes of Princes and Princesses. Whether mourning shall be worn during seven days or fourteen for the ruler of a neighbouring state, whether a court may wear mourning for two or three Princes concurrently, or whether each must be honoured with a separate term of mourning—are questions which cannot always be settled without creating a little uneasiness. The custom of cumulative mourning has had to be adapted because the reigning families of Europe now form a very large clan, all of whose members are more or less connected with one another by marriage, so that kings and courtiers would have to wear black nearly all the year round, if they mourned for all their deceased relations. Accordingly, it is not usual to take official notice of a royal death until the formal announcement is published by an envoy, and when several deaths have occurred, it is arranged that different envoys shall all present their notifications *de deuil* on the same day.

The poorest Princes are of course those who are most liable to take offence at any untimely mark of respect or omitted towards them. One of them visiting Windsor, was observed to be very sorrowful, not to say sulky. Sir Charles Phipps, who was the Queen's Secretary at the time, and who was always very attentive to see that the guests at the Castle were well pleased, asked one of the Prince's suite what was the matter with His Highness. It turned out that HSH was miserable because when Her Majesty received him, he had not seen her wearing the insignia of an Order for ladies which he had created. The reason of this was that, by some oversight, the box containing the insignia had been left at Windsor. But the Queen, with her usual kindness of heart and strict regard for all the courtesies of her station, at once ordered that a telegram should be sent to Garrard's, the court jeweller's, and in the course of a few hours she received a new star and ribbon, which she wore at dinner that evening. The fact that Her Majesty should have been so careful to avoid giving the slightest cause of offence to a Prince

of no very high standing, shows that, at court, etiquette has to be studied as assiduously as a science, and practised almost as devoutly as a religion.

## AN ANTIDOTE TO SILK ADULTERATION

IN those days of keen competition in every department of trade, it becomes daily more desirable, by the compression and simplification of initial processes, to reduce the first cost of raw material to the smallest possible figure. In the case of the fibres of commerce, such manipulation proves successful, inasmuch as the article so treated is presented to the manufacturer cheaper than formerly, and without any deterioration in quality. On other occasions, however, or rather reduction in price only, is achieved. In the latter category, silk may be placed. For many years past, this beautiful substance has, from no inherent defect or shortcoming of its own, been one of the shuttlecocks of trade. Attacked by a variety of fell diseases, the silkworms of Europe have, during the past quarter of a century, been annually slain by millions, so that the crop of silk has gradually dwindled to about one sixth of what it attained during the height of its prosperity. Fortunately, these maladies have at length been checked, and the industry seems now within hail of returning to its former state.

Meanwhile, in the difficult attempt to spread a diminished supply over more than its previous area without a sensible advance in price, adulterations and fraudulent dealings have crept in, so that our misters, wives, and daughters tell us that the yard of silk lately sold over the drapers' counter was as little worthy of being compared, in toughness and wearing qualities, with the same article, to all appearance, sold a few or fifteen years ago, as a sheet of blotting paper is comparable to a skin of parchment. Adulterations of any kind are inadmissible, nevertheless a few of those introduced into fabrics are looked upon by the public, under the circumstances, with a somewhat lenient eye. To some of the silk adulterants, however, no quarter should be given. "Charged silk" is the name applied to that material when treated with certain ingredients, such as arsenic, which enable it to serve and retain as much as three hundred per cent of dye, but at the expense of honest dealing, and at the terrible risk of spontaneous combustion if some unlooked-for moment. Another fraudulent process even more reprehensible—actually prohibited by patent at the time of its introduction—was that of coating silk thread or yarn in a bath of acetate of lead, and when dry, treating the binks or skeins with hydrosulphuric acid. Sulphuric acid, to the extent sometimes of twenty three per cent, was found to have been deposited, and the adulteration not being distinguishable by the eye, suspicion remained unexcited, whilst the chemical application, combined with the first mentioned fraud, added enormously to the weight, imparting a sense of substance, an air of strength, and a look of superiority wholly fictitious. The effects upon persons who used such poisoned thread were occasionally dismal in the extreme.

Some few years ago, the *Montreal Journal of Commerce* cited a case where all the girls in a dressmaker's establishment in that city were,

along with the principals, suddenly seized with painter's colic—many of them afterwards losing their teeth—traced to the fish female habit of biting off the ends of silk thread at the termination of scenes, which in this instance had been unpermitted with lead. The hours of labour in the workrooms in which many seamstresses toiled are too frequently not so limited or so salubrious that such an apparently trifling affair as the poison from the end of a silk thread may with impunity be neglected. The effects of lead in the system in minute quantity may be slow in evincing themselves, but they are insidious and cumulative, and years of suffering as thread impregnated with this metal may culminate in paralysis, or abruptly end in premature death. Fortunately, the means of detection, this particular fraud are both easy and inexpensive. In order to prove a sample, it is only necessary to place a fragment or two of the suspected thread in a test tube or clear glass phial, moisten with water acidulated with a few drops of strong vinegar or acetic acid, and adding a drachm of iodide of potassium. Should lead be present, a golden colored deposit of iodide of lead will immediately betray the sophistication.

■ Much of the adulteration of silk may be chargeable against our lively neighbours in the other side of the English Channel, it is but fair to remark that it is to some distinction. I have been told that one of the suggestions of an interesting antidote, namely, to stain the silk worm to become its own dye, thereby at least throwing obstacles in the path of the guile. When a visitor to the London Dock, or else when, happens to see a consignment of raw silk, he will likely note that the prevailing color is yellow, although there are other natural tints besides. We receive pure white silk from China, in almost colourless variety from the *Larva picea* worm, nearly white silk from the *menes* or *coron* insect, and delicate grey filaments from the *elias* grub—all belonging to India. From China, Japan, Persia, and Siam come chiefly golden yellow silk, whilst India yields a similar colour in addition to those just alluded to. All to these the finest natural silk of Northern China, evolved by a silkworm which subsists upon the leaves of the mountain oak, and the pearl grey product of the *Attacus cyathus*, fed upon *Abutilon* leaves, and the lot of natural colors found in raw silk will be nearly exhausted. Now, if we eliminate the pure white, nearly white, and delicate greys from our catalogue, which, indeed, can hardly be regarded as colours, yellow in various shades may be said to form at present the only primary natural color produced by the raw silk of commerce, hence the necessity for extensive dyeing, and hence one of the openings for fraud.

Viewing the matter probably somewhat in this light, Mr. Rood, about the year 1876, or probably a little earlier, conducted a long series of experiments, and at length succeeded in obtaining pink blue cocoons through the administration of minute allowances of indigo to his silkworms along with their mulberry food a short time before they began to spin. Encouraged by this little triumph, he proceeded to strive for other naturally produced colours, and after much research and many disappointments, got red

roses by firing with the leaves of the *Begonia chana*, or trumpet flower of the Orinoco, one of an order furnishing the most gorgeous chambers known to botanists. Phœni and assisted by such a prosperous commencement, he intended going further, and it was to be hoped that his patience and skill have thus been rewarded by additional discoveries.

About the same time, another ingenious inquirer, Rismet des Tillas, found that ruby-tinted silk could be obtained by feeding silkworms for a time on a variety of vine, and deep crimson hues arose by the partial use of kidney leaves. These interesting discoveries, owing probably to the long continued but now almost unlabeled silk worm industries, seem, unfortunately, not to have been followed up to a practical issue. Several tentatives had been too much occupied in trying to give eggs of the silkworm, or in stamping out the various diseases, to attend to what, after all, must have appeared, under the auspices, or assistance, a matter of minor importance. But it is to be hoped that the results of all such experiments will now be collected into a form, and that the time is not far distant when the silk worm will be permanently established in its own day, and no help to render it to do it future adaptations. In any case, it is interesting to learn that the promoters of the combined industries of Turbidity and silk production, as hereinafter, as it is now termed, in New Zealand, intend to push forward this important line of research in opportunities occur, the variety of floral wealth and significant climate that offering facilities which seem to point towards a brilliant result.

#### TWO BIRD ANTIPODES

A CORRESPONDENT writes us of New Zealand. In the Christmas week of 1871 I was, under some, my final examination at one of the London colleges. I must mention that it was at the same time that His Royal Highness the Prince of Wales was battling with typhoid fever at Sandringham, and the heart of the whole nation was round that which had, even medical students, believed in, but not by an examination which extended over five days, used to find time, morning and evening, to rush to the General Post office and read the latest bulletins.

My exam was over, and I was sitting in comparative comfort, listening to the answers of a Bartholomew's man who followed me, and whose cool self-confidence I greatly envied.

The examiner took him on the treatment of typhoid, and after the candidate had exhausted all the means of treatment he could think of, without satisfying his questioner, the latter said, 'Have you never heard of the treatment by cold baths?'

'Certainly I have, sir,' replied the candidate, 'but the treatment is so very novel, that I scarcely thought it worth mentioning.'

'Nonsense!' retorted the great physician, 'I have been using it with the best results at the Hospital.'

The Bart's man replied that, in spite of that, he should hesitate to adopt it in private practice, as in case of a fatal result occurring from any other cause, it would infallibly be attributed to

the new treatment, and during the practice. The examiner demurring to this, the young man at length said, 'Pardon me, sir, but if the Prince of Wales were under your care now, do you think you would feel inclined to treat him with cold baths?'

The examiner looked unmoved for a moment, then began to smile, then to laugh outright at the man's impudence, and at last, shaking his shoulders, replied good-naturedly, 'Well, upon my word, I am not quite certain that I should!'

More recently, at another London Examining Board, a young fellow was asked what reason he would make in commencing a certain operation on the knee joint. Though he had done well in other subjects, he came to utter grief in this, and hesitated an operation such as that he had ever heard of. The examiner asked him what surgery he had seen perform that wonderful feat, and he, with some unflinching stammer, mentioned the name of Mr H—, a celebrated man, who had passed, though unnoticed by him, to be in the room at the time.

Mr H—, I believe, received a groily remark of that kind from his examining brethren on the subject of his skill and operation, for which all were over, the delinquent was horrified to find the well-known surgeon 'making for' him in the entrance hall. After an unhesitant attempt to escape, he turned himself to his fate. 'I believe, sir,' said the great man, 'you are the gentleman who despatched an examination of the knee just now upstairs?'

A stammering attempt at an apology was the only answer.

'Never mind that; never mind that!' interjected Mr H—. 'I have no doubt you thought you had a perfect right to make the best of your case, but if at any future time you should have occasion to describe an operation of that sort, pray, don't say you saw me perform it. That's all. Good day, sir!'

The offender passed his examination, which was more than he had hoped for, and, I think, quite as much as he deserved.

I think your readers will agree with me that these anecdotes show the cruelty and good nature of our British examiners in a very strong degree.

#### THEY'LL NO FURNIE, BY F. CHOTIN

A Morn'g dawn and tender day,  
All we're and walks awake with dew,  
Wide open the meadows for the day,  
And I soon baird paths for evening hours  
A bright best dream that had no rest,  
And of the future knew no fear,  
A kiss as sweet, a sigh as true—  
Only best yet

Another again, dum deleva a coda,  
No farewell to me no thing, fear,  
He stone to mark what where I've to  
O'er the dead love we found so dear  
But oh to me the green grass grow,  
The budding branches all are new,  
For sweet love's sake, that died once, die,  
Only last year

## ARTFUL DODGES

THE truth of the aphorism that 'Crime does not pay, is so generally recognised and so frequently made evident, that one is almost tempted to wonder at the existence of criminals at all. For although it is sometimes said that the clever rogues are those who are never found out, yet it may safely be asserted that a career of crime generally leads to detection and punishment, whether the evil doer be skilful in evasion of the law or not and since a wrongful act successfully executed is almost certain to encourage its perpetrator to a repetition of it when an opportunity arises, one may assume that malpractices are more likely to become habitual, and to entail their just reward through the carelessness bred of immunity, in the case of clever knaves than of clumsy ones. Nevertheless, there seems to be some terrible fascination with a certain class of people in dishonesty for its own sake.

The ingenuity displayed in some of the instruments devised by conners and burglars, often involving the application of elaborate scientific principles, and the patient industry and perseverance with which nefarious schemes are matured and carried out, are qualities which, in their legitimate exercise, would realise for their possessor an income beyond any gains that his unlawful endeavours can bring, even were those devoted to risk and not liable to failure. We read, for instance, of a clipping machine by means of which the body of a sovereign is separated from the 'milled' rim which encircles it, a thin slice cut out of the centre, leaving the two faces intact, the loss supplied by an amalgam, and the coin then dextrously put together again so that neither the weight nor the 'ring' of it is greatly altered. One would imagine that the amount of gold thus obtained would hardly cover the working expenses, at best, the profit must yield a much lower percentage on the invested capital than what it would return in honest business.

It is surprising also to note what a class of small frauds have for people not usually included

in the criminal classes, and nowhere is this exemplified to a greater extent than in the provision for petty smuggling which seems inherent in the breast of travelling humanity. Men who would scorn to make an imperfectly obliterated postage stamp do duty a second time, and whose integrity in all other affairs of life is unimpeachable, will plot and plan all sorts of cunning devices by which they may cheat Her Majesty's Customs houses, and will even spend more in 'tips' to elude the vigilance of the officers in 'running' cigars and spirits which they do not want, than they would have to pay for legal duty. Possibly the law's delay—or the delay which it occasions—may afford some cause, if not excuse for this, the weary waiting and vexation of soul attending the baggage search being the most disagreeable incident of a voyage.

Marvellous are the dodges which have been resorted to in this connection. Stuffed animals in glass cases have exhibited, on dissection by inquisitive tide waiters, a beautiful adaptation of the taxidermist's art to the tobacco merchant's interests, weasened black and tan terriers have been enveloped with yards of rich, delicate lace, wound round their bodies, and, provided with a shaggy outer skin, have, in the guise of fat poodles, been carried ashore in the arms of their affectionate owners. Ladies' chignons and Spanish cushions have formed receptacles for gold watches and precious stones. A list of all the things which have been 'hollowed out' with intent to deceive would make a catalogue as long as one of Messrs Christie and Manson's. We often meet with baser metals coloured or plated to counterfeits gold, but for the purpose of evading import duty, solid gold vases and other ornaments have been bronzed over and packed carelessly amongst straw in rough crates, like iron pots and kettles. Occasionally, through some mishap, these bronzed articles appear to have gone astray, masquerading through society in their humble character for a considerable time before their real value has been discovered, and meeting with many curious adventures. A

similar method of concealment, however, was practised with regard to gold plate in older times, when the making of monasteries, and high handed confiscation of wealth in all quarters, were in vogue.

Tobacco, unmanufactured or in the shape of cigars, and spirituous perfumes are more frequently brought to light from strange hiding places by the excise searchers than any other forbidden fruit, and the would be smuggler must have all his wits about him nowadays to effect his object. Talc bottomed boxes are quite out of date, though a cage of innocent looking pigeons from Antwerp proved on examination the other day to be thickly carpeted with cakes of tobacco, over which a quantity of gravel and corn, appropriate to the feathered occupants, had been strewn.

Mr. Frank Buckland used to relate an anecdote of a traveller coming from America who 'passed some hundreds of cigars successfully through the Liverpool Custom house by placing a live rattlesnake in the chest to mount guard over them. Evasion of the law in this particular has brought its own punishment more than once, for men who have padded themselves with tobacco underneath their clothing have died from absorption of the nicotine. Spirits are rarely smuggled by stratagem, owing to their low value in comparison with bulk and weight, and the difficulty of stifling the characteristic bubbling 'clink' of a liquid when shaken, and the constant preventive service has well nigh demolished the old trade of lanling large quantities from boats. Certain jars or kegs, labelled 'Specimens—with great care—To the Curator of the British Museum, have turned out to be full of the best French brandy, in which the enterprising naturalist to whom they belonged had immersed a few thin leather bottles of serpents and fish, but heavy penalties and reduced tariffs of duty render this illicit traffic far less profitable than it used to be. During the Civil War in the States, the soldiers were forbidden to introduce spirits into some of the camps, but 'preserved fruits' were allowed, until these delicacies assumed the form of one small punch in a quart bottle of whisky, when all such luxuries were prohibited. Looking nearer home, perhaps cherry brandy does not always contain so large a proportion of garden produce as the hermetic reputation which that liquor popularity enjoys would imply.

An artful dodge came to the knowledge of the assay authorities a short time ago, and has caused them to modify to a great extent the indulgence hitherto shown to manufacturing jewellers in assaying the quality of and stamping unfinished articles. Chains with hollow links, and brooches or bracelets consisting of a mere shell of gold—such as are often honestly sold for what they are—would be sent in, the purity of the metal ascertained, and the component parts of the ornament hall marked accordingly. But before exposing them for sale, the worthy makers hit upon the plan of filling these golden cases with lead, thereby increasing their weight a hundred fold, and the profit realised upon them proportionately, making due deduction for the value of the workmanship, which of course would remain

unaltered. Though this is just as indefensible as any other form of adulteration or imposture, it is attended with the unusual feature, that in all probability the victim will never discover the fraud or be mentally the worse for it!

Some of the expedients which professional thieves adopt compel something very skilfully akin to admiration by the mixture of cunning, daring, and close observance of human nature which they manifest—at all events, they appear absolutely respectable beside the brutal robberies with violence which so frequently occur. A gentleman with a valuable watch or well filled purse or pocket book is marked and followed. Very likely he has himself bespoken the attention of the light fingered fraternity to the fact of his possession by the nervous ease with which his hand protects it as he hurries along. He stops to look into a shop window, a paracent fly—attached to a loop of silk—seems to tickle his ear, he raises his hand once or twice to brush it away, and watch, purse, or pocket book is gone, even though the cost be slit to obtain it. 'Stop, thief!' he shrieks. So does that quiet young man who happened to be gazing into the same shop, giving energetic chase to some wholly unconscious individual a quarter of a mile off—very likely holding him until the theft is complete, to see if he can identify him, and perhaps getting a small reward for his trouble. Should he be collared on suspicion by some ruthless policeman who chances to have enjoyed the honour of his acquaintance previously, he stands in but little danger, unless any bystander has actually seen him do the deed, for no trace of the stolen property is found upon him. What has become of it, then? It was dropped, three seconds after its abstraction, into the umbrella of a guileless looking individual with the aspect and attire of a country peasant, up in town for a week's sight-seeing and roaming in an unconscious manner through the crowded streets. But thieves, when pursued, have but too now tampered with their booty upon them by the cool adroitness with which they themselves joined in the chase.

That laudanum and other opiorific drugs should be administered for the purposes of robbery, one can understand readily enough, though, in all probability, the frequency and facility with which this is done have been greatly exaggerated. The quantity which is necessary to produce the complete and immediate insensibility we read about, would render a cup or glass of any liquid with the natural flavour of which the imbiber was familiar, extremely nauseous, while the only substances which can really represent the 'white tasteless powder' which figure so prominently in these tales, are intensely powerful alkaloids, used with great caution even by physicians, and not likely to be within the reach of ordinary pickpockets. Of course, it sounds much better for a man who has had the misfortune to lose his watch and chain, to say that his liquor was drugged, than to be obliged to recount the fact of his having casually met two or three jovial fellows, who pined him until he lapsed into alcoholic somnolence pure and simple. Granting, however, that opium or chloral may sometimes be employed in this way, what are we to say to those cases where the victim smells some queer odour emanating from a pocket-handkerchief and

remembers nothing more! Medical men do not find the administration of chloroform, ether, bicarbonate of methylene, or any other anæsthetic by any means so easy, where all the conditions are favourable and the patient voluntarily submits to the inhalation, violent delirium and excitement very frequently precede unconsciousness, rendering it necessary to restrain the limbs by physical force. Those instances in which maniac influence is alleged to have been brought to bear on unwilling subjects by themselves, are still less comprehensible.

There are certain churches in London where the body of the edifice is allotted to the poor holders who constitute the regular congregation, while the galleries are free, and are generally occupied by chance comers, attracted by particular services or preachers. The collection bag or plate is passed around in the usual manner among the sitters below, but a churchwarden stands at each exit to the gallery, as the people are leaving, to receive such offerings as the occasional worshippers may be pleased to give. In one of these churches—situated at no great distance from the three railway termini which communicate with the North—an awkward man stumbled in descending the stairs, and falling against the plate holder, scattered the collection already received—for the clumsy individual was one of the last to depart—over the floor. He was profuse in his apologies, trusted that he had not hurt the churchwarden, explained 'how it was' that he happened to slip, jumped about with a great show of alacrity in seeming to pick up the coins, and finally, with renewed excuses, offered to make good any loss, if such occurred and the amount could be stated, took his leave. But alas! if his fist did not, like those of Tennyson's heroines, set a jewel print in the earth upon which they trod, they shed a jingling shilling and a sixpence upon the stone steps outside, and led to their owner performing his devotions for many a Sunday afterwards in the chapel of Holloway jail. Whilst in church, he had thickly smeared the fore part of the soles of his boots with prepared wax, walked down stairs upon the heels, and by his ingenious manoeuvre had secured his fist with the offer 'tory'!

Those who deal in precious stones or metals, whether in the rough state or manufactured as articles of jewellery, are naturally more exposed to the schemes of artful dodgers than most people, and it is extraordinary to see how, when they are equal to every stratagem that cunning can evolve, they are sometimes taken in by bold, blaring, naked impudence. Only the other day, a respectably dressed young man called upon a well known firm of jewellers in the Strand and requested to see the principal in business. Shown into the private office, he stated that he had a valuable parer of diamonds, the worth of which he wished to have ascertained, with a view to disposing of it, if he could obtain a fair price. The jeweller was willing to entertain the proposition, and the applicant departed, promising to return with the specified article for examination an hour later. He immediately proceeded to a diamond merchant in Regent Street, where he represented himself as being in the employ of Messrs. So-and-so—the firm whose premises he had just

quitted—saying they wished to purchase a necklace of stones of a certain value, and requesting that samples might be sent at once—no unusual or suspicious order, but an affair which might occur any day in the ordinary course of trade. Some necklaces of brilliants were selected and placed in a case, and the supposed messenger, with a confidential clerk in charge of the diamonds, took a cab, and were driven forthwith to the Strand. 'Wait a moment,' said the swindler, who got out first, 'I'll just see if the governor is disengaged,' and went in, leaving the clerk and the diamonds in the vehicle. The governor was disengaged, and consented to a private interview and consideration of the parer at once, the young man returning to the cab without his hat to fetch the parcel, which he had left in charge of a friend. 'Come along!' said he to the unsuspecting clerk. 'Mr. — is at liberty, and will see you immediately,' at the same time taking the case of jewels from the other in the most natural manner possible, and preceding him butelade! with all the confidence of an inmate of the house, towards the master's office. At the threshold of that apartment he paused, politely holding the door open for the clerk to enter first, at the same time introducing him by name. The instant the myriads in it had passed him, our friend turned, slipped out at the house door, which opened into a side street, and vanished, diamonds and all! Here, there must not only have been an intimate knowledge of the premises and the habits of those who were thus unconsciously made to do duty as lay figures in the accomplishment of the trick, but efficient co-operation of confederates outside must have existed, or the spectacle of a halless man, otherwise well clothed, would certainly have excited attention and led to arrest.

As for the substitutions of paste for precious crystal, there is scarcely any jeweller who has not been deceived at some time or other, and many could furnish the materials for a curious romance of real life from the attempts at this imposture which have occurred within their experience. Some of the biggest rascals with whom they have to deal are the men—Jews for the most part—who buy up objects of value for the purpose of breaking them up, and selling the stone, metal, &c. which result from the process, to working gold and silver smiths for re-manufacture. If these individuals are crafty in selling, it may well be imagined that they are not over nice in their buying. That they ask no questions of pedantic vendors is of little importance, since they are astute enough, as a rule, to decline transactions which they perceive may possibly compromise them. But a gull article taken behind a screen to be 'tested' is easily made to appear as nothing but gilded silver, to any one ignorant of three details, by the application of a little quicksilver to one spot, and a contemptuous valuation accordingly. One of these worthies had a pair of scales which had long been suspected, though they were used under the eyes of the customer, and had been subjected to repeated examinations without anything wrong being detected. At last, it was found that underneath each tray was a piece of soft iron, made magnetic at will by the completion of an electric current. This was managed by pressure of the

right or left foot upon one of two buttons underneath the counter, and so, although the balance of the beam was perfect, the operator could cause either scale—according as he was buying or selling—to descend prematurely at his pleasure.

## ONE FALSE, BOTH FAIR.

OR, A HARD KNOT.

CHAPTER VII.—MR. TUCKER'S LAWYER.

'Now, My Lady——"Your Ladyship" you shall be to me, and to us true Devonshire hounds down stairs. Now, Mrs.—My Lady—we've had our heads together in the basement here, and I, as being the oldest servant, naturally took the lead, and so we've made our minds up. Breaks my heart, it does, begging pardon for the liberty, to see you, dear, driving away in Sir Pagan's brougham, hunting after lawyers, and not getting 'em, covetous creatures! You're laughing at me now, for an old goose, and quite right too.'

It was worthy Mrs. Tucker, the old housekeeper, who spoke, with what entire honesty and an air of purpose only those who have had to do with the warring class of loyal old-world servants can thoroughly appreciate. It had been but a smile, not a laugh, that her words had summoned to the lips of that young creature, whose life was so solitary beneath the shelter of her brother's roof-tree. Now she rose, and kissed the kind old woman's wrinkled cheek. 'You have done me good,' she said with a sense of evident relief. 'I feel sometimes, do you know, as if I should go mad here—it is so lonely, and all I meet with is distrust.'

Mrs. Tucker could not repress a little sob. At any rate, that sister of Sir Pagan Carew's who dwelt in the gloomy Bruton Street house that had belonged to her grandfather and her great grandfather, had made a conquest of her brother's household. Old Mrs. Tucker the housekeeper had been the first convert, and every man and maid, born and reared in Devon, and vassals, so to speak, to the broken-down, over-honoured House of Carew, would have faced the ordeals of fire and water, on what seemed to be the losing side. James in shabby livery, Bob and Tom in the stables, were willing any day to tuck up their dingy cuffs and try fistie conclusions with the magnificent powdered footmen of Leominster House that their fair candidate was the true one, and the reigning sovereign a counterfeiter. 'Key' out of her rights.' The very phrase was enough to appeal to that honest, thoroughly natural and human hatred of injustice which is the most sincerely felt among the lower and the less taught classes, which has been the stock-in-trade of many an impostor, which made Cade master of London, and to this hour flings a sentimental halo around the Man in the Iron Mask.

'Now, My Lady,' resumed Mrs. Tucker, 'we've

been turning the matter over, and James, which his uncle Guppy was a master builder at Heavitree near Exeter, and Susan, whose stepfather keeps the Bull at Sedmouth, have said what they thought, and two very tidy legal gentlemen, I am sure, they knew of. But all agreed that my lawyer—Lawyer Sterling—was how he behaved about my poor husband Stephen Tucker's bit o' property, and what a jewel of a man he proved to my poor only son Ned, that died out in Quate Guava there. I never can pronounce the name of it, but it's a hot place in South America, where the sun is always like the kitchen fire, and where my poor boy was mining engineer, and sickened of broken heart and yellow fever. It was owing to Mr. Sterling that he died in peace and comfort, so he wrot me with his own shaky hand—that used to be so firm—because of the remittances, for they had clapped him into prison, the Dons had—so he said—because he was an Englishman and a foreigner, and his employers had run away, and the water couldn't be pumped out—and so the rest of my poor husband's money made his latter end comfortable. My Lady' summed up old Tucker, wiping her eye.

The gist of the old housekeeper's will meant advice was, as was presently discerned, that there lived in London a very amiable, kind, and honest solicitor, learned in the law, whose name was Sterling, whose reputation was high, 'though he's out of us, Mrs., only by the mother's side, which she was a Whitton, of Clovelly, and if it isn't a Devonshire woman, what is!' explained Mrs. Tucker, commencing in a deprecating fashion, and ending triumphantly, 'for, otherwise, Mr. Sterling, as a Yorkshireman (Canary Lane he lives in, and both North and South go to him, and if he can help 'em, he does so it.'

Such good advice was not to be slighted, though the timid offer which followed—'And as lawyers must be paid, if seventy-nine pounds that I have saved, my dear young lady, in your mother's service, would'—was of course gratefully declined.

The lady of whom we are speaking had not allowed herself to be disconcerted by the failure of her attempts to influence Mr. Ponter and Mrs. Hawke and Hironshaw. She had made her poor little savings into legal quarters, and had always been sent empty away. One solicitor would, very properly, accept no client without a formal introduction. Another, perhaps still more properly, wanted a thousand pounds paid down as a preliminary, before entertaining the idea of so difficult and costly a suit. It was with repugnance that she had consulted her brother's attorney, Mr. Wickett, against whom, somehow, she had been prejudiced from the first, and who trusted business in very splendid, not to say flashy chambers, all gilding, plate-glass, mirror, and silken furniture, with champagne at hand for jovial clients, and carcases and cherry brandy to brace the nerves of timid or rickety clients. The rooms themselves were in no obscure court of the Temple or of the Inns, but in a conspicuous West-end thoroughfare, crowded every day, and had been originally fitted up by a thriving money-lender, who had since

then retired on his game. Mr Wickett the sporting lawyer had been less respectful than any of the other attorneys with whom Sir Pagan's sister had sought audience.

'It won't do,' he said, standing, with his thumbs in his waistcoat pockets, and his varnished boots and corded riding trousers a good deal apart. Mr Wickett may never have mounted any course more rampant than the Hampstead donkeys of his boyhood, but he thought to please his clients, and perhaps improve his own imagination, by dressing as though his life had been spent on Newmarket Heath and in the saddle. 'It won't do,' pursued Mr Wickett, 'it won't wash.'

'If your pardon, I am afraid'—his words were client-hill and, a little of indignant colour mantling in her pale cheek, for the tone and bearing of this vain, coarse, little bantam cock of a sporting solicitor seemed to her insufferable.

'I told your brother, Sir Pagan, yesterday, Miss Carew,' explained the lawyer, 'that I was quite willing to give you a chance—to put you in the witness box, as it were, and let you tell your own story your own way, just to see what sort of a figure you would cut in court, perhaps with Hunter, Q.C., to cross-examine—or Frier. Yes, I should say, Frier is the best, when it's a lady who is on her oath, because he'll get a laugh from the jury, isn't it—'

'Excuse me, sir, the applicant had said, among hastily from her seat. 'I gather from what you say that you dislike her'—her voice trembled with anger, agitation, shame—so Mr Wickett judged, and he did not think well of her. Perhaps what he had seen of women did not predispose him to think well of them. He shook his head.

'My belief, or the contrary, matters very little, madam,' he said dully. 'The question is, what you can get twelve good men and true in a box to believe, and my lord is his horsehair to believe, and then the lawyers of the Court of Appeal, and the rest. My own idea is that the whole affair must end in a break down. It may cost money—say five thousand, more likely ten—if you stick to it, and the chances are four to one, but the result will be the same anyhow. You haven't the ghost of a chance. If you had, for Sir Pagan's sake I'd have a shy at it, but indeed the odds won't work—it won't, I assure you.'

It was but cold comfort that was to be derived from Mr Wickett, whose chambers his visitor left with a swelling heart, and the awkward conviction that she had been coarsely told that she was, not an impostor merely, but a self-convinced one. It was not for some days after that misadventure that she could muster courage enough to resume her search for a legal champion. Nor, perhaps, would she have done so then, even for Mrs Tucker the housekeeper and her kindly counsel. As it was, she shook off the lassitude that was creeping over her more and more, and in the battered brougham that was now entirely set aside for her use, repaired to Mr Beeching's chambers in Chancery Lane.

Mr Sterling was not at all, corporeally speaking, what the applicant had expected to find. The housekeeper had described him as a York

shireman, and that is a word which to southern ears usually conjures up the image of a hale, burly, well-grown individual. Whereas, Mr Sterling was a little, hatchet-faced man, with thin cheeks, a parchment complexion, and a dull dead eye—perhaps the most disappointing lawyer to look at that ever a client smarting under wrongs encountered.

Sir Pagan's sister told her story. She did not tell it well. She was angry with herself, and vexed with herself, because she told it so ill. It had been a lame tale, lamely told, and so she felt. Whether her statement were false or true, matters nothing as to her mode of making it. She bore up ill against misfortune, however deserved, and the weeks spent beneath her brother's roof, and perforce without female companionship, had had their effect upon her nerves. The Carew girls, in Devonshire, had always borne the reputation of having the tempers of angels. They had been two bright, gentle, young things, welcomed as summer sunshine at the thresholds of damp cottages and moonlit farms. Now, she who dwelt in her brother's house in Bruton Street had grown silent and sad, and the blue eyes were wont to look sometimes as though they could flash on occasion. She seemed less beautiful, because less animated than usual, as she told her tale to this dull little lawyer.

Presently, the dead dim eyes that had damped the hopes of many a young client began to brighten. A little colour came into the parchment cheeks. The whole face assumed a look of virile strength and intelligence that transformed it, just as when, over a leaden coloured sea, the sun breaks gloriously through envious clouds, and every tiny wafted sparkles in the broad gold path that is flung across the deep.

'I think, now, that I begin to see it,' he said, more to himself than to his visitor, and then, much to the surprise of the latter, the light died out of his eyes, the flash faded from his face, and he became more thoughtful than before, and seemed really to forget that he was not alone in the room. The pul watched him anxiously with a beating heart, but as his reverie continued, she could not help thinking that he was, in spite of excellent Mrs Tucker's commendations, a very unsatisfactory sort of adviser. The other attorneys, though they would not befriend her, did at least impress her. Even their offices, including that flashy mill wherein Mr Wickett of sporting celebrity ground his clients' bones to make his bread, had seemed more imposing than did the room in which Mr Sterling sat among his books.

Meanwhile the lawyer, after his period of meditation, lifted up his thoughtful face and confronted his client. 'I must ask you, if you please, kindly to make indulgence for me,' said Mr Sterling, in a subdued but steady tone, 'nor do I know that I had ever such a request to address to a client before. Nor, in all the course of my professional career, have come before me so difficult, perplexed, and complicated a case as that which lies before me now. Mrs Tucker is a worthy woman, and has often testified to her loyalty to the ancient race from which you spring. I myself am, on the mother's side, a Devon man, and I know how high is yet in Devonshire the name of Clew. This would of itself predispose

me to help you, if I could. And I have always helped, to the best of my poor powers, those who were suffering from injustice, too much of which, through weakness, credulity, ignorance, on one side, through fraud and violence on the other, is yet rampant in the world—You don't," he added, sadly shaking his head, "think much of me."

And in truth the claimant of the Legumister coronet had not been disposed to think much of Mr Sterling. We are all of us so very much inclined to judge by externals. A big man, if he be but gifted by nature with average brains and energy and tact, has, if he did but know it, a clear start in life, when contrasted with those who are of lesser stature. Unlike him, transparently a fool, he is credited with sense, and if not abnormally weak-kneed, he has at least the reputation of being willing and able to fight. But poor Lawyer Sterling was a mean looking, feeble, little fellow, and it was only by a great mental effort that a feminine client could dream of him as a knight capable of laying lance in rest for her. And yet Mr Sterling hid his merits. His pale face could reddens, his dim eyes could glow, as if every pulse that chivalry ever set in motion were throbbing in that shrunken body of his—the man seemed ennobled by the feelings that swelled his narrow little chest. I doubt if, in the old ordeal of wager of battle, poor little Mr Sterling would not have lost his saddle before the spur of the truest knightly moundrel that ever, after solemn oaths, set spurs to his horse to back a lying accusation. But I am sure that the brave little man would have done his puny best, like wounded Wilfrid of Ivanhoe when facing the Sute Limpler to save Rebecca from the stake.

Something, some thought of his respect for the man, in spite of his low stature and his pained face, moved the fair client to a hasty response. "You mistake me, sir. What I long for is a friend who can rescue me from this false, cruel position. I have been robbed of all—accused of all—and, and—"

"I understand your meaning, madam," said Mr Sterling promptly, but very gently. "False indeed, and cruel indeed, would be your position, if matters are as I am inclined to think. You must excuse me, however, if I ask a little time for deliberation. Give me time."

The girl started. A tell tale blush suffused her face. Those were her own words. It was the very plea which she had urged when deferring her acceptance of Madame de Lalouves proffered aid.

Mr Sterling saw the blush, and misconstrued it. "Do not mistake my meaning," he said. "This is a very difficult case, and the litigation may be ruinous. I am not one of those lawyers who tell suitors, as many of my brethren very properly do, that the victory is to the low, set purse. I believe that, in spite of the proverbial bandage that Justice wears over those bright eyes of hers, the magic scales do incline, somehow, on the side where Truth is. I believe that the glove of Justice falls upon the guilty neck. I do believe, indeed, that we are not utterly forsaken, and that there is a God who judges the earth. Only give me a little time—it is all I ask—for thought and for inquiry into this matter, and I assure you,

madam, that [redacted] could find no sincerer friend than William Sterling."

It was with a lighter heart than usual that Sir Pagan's master went back to her brother's dreary home in Bruton Street that day.

## THE LAWS OF CHANCE.

BY W. STREADMAN ALDINE.

### IN THREE PARTS.—I. GAMES AND LOTTERIES.

We have it on very high authority, that in human affairs 'the race is not to the swift, nor the battle to the strong, neither yet bread to the wise, nor yet riches to men of understanding, nor yet favour to men of skill, but time and chance happeneth to them all.'

There are many events in the daily life of each of us which, as far as we can see, come to pass in accordance with no rule, and the occurrence of which, in default of any better method of explanation, we put down to chance. This is true not only of unimportant and trifling matters, but even of some things which are of very weighty import and influence on our lives. By chance, apparently, we turn down one street instead of another, and meet with news, good or ill, which alters the whole course of our lives. By chance, apparently, we pass into a den of fever, and contract a disease, which cripples us for months or years. By chance the wild miner stumbles on a nugget which makes him a rich man. There are men who are so unimpressed with the power of chance, that they attribute the existence of all that is, and the occurrence of all events, to its operation. The old Greeks maintained that while skill had a me share, yet Fortune was the deity which had the greatest part in the successes of statesmen and the victories of generals; and some modern sceptics have held that to chance is to be ascribed the formation of the terrestrial universe, and all the life which inhabits and adorns it.

The believer in a Providence that overrules events both small and great, has, of course, no room left for belief that anything really happens by chance, but to all, the expression is a convenient one in relation to the occurrence of events as yet undecided, concerning which we have no certain knowledge one way or the other.

In considering the possibility, or the reverse, of the occurrence of some future event, we are all aware that we are capable of entertaining very different kinds of anticipation, according to what we call the likelihood or unlikelihood of the event. This statement will be best illustrated by comparing a series of assertions such as the following:

It is impossible for a man to get to the moon.  
It is very improbable that it shall be fine during the whole of this month.  
It is improbable that the train will be on time.  
It is just possible that it may be punctual.  
It is not unlikely that it will be late.  
It is likely to rain to-day.  
It is very probable that it will rain some day this week.  
It is almost certain to rain before the end of the month.

Here we have a number of expressions of the state of mind of some person unknown, in relation

to his expectation of the occurrence or failure of an undecided event. In all of them, the view entertained obviously depends on previous experience under similar circumstances. There are few who have not suffered from the unpunctuality of trains. We therefore think it likely—that is, like what we have already known to happen—that trains will be behind time in the future. Our estimate of 'likelihood' or the reverse depends in all cases on a supposition that the like of what has happened already will happen again. The perpetual recurrence of summer and winter, seedtime and harvest, day and night, from year to year is with most of us the real source of belief in the 'likelihood' that while the earth remains they shall not fail. Thus it happens that in business, in politics, and in war alike, he who has most knowledge of the past and most observation of the present, is also most capable of 'calculating the chances' of the future. Thus, too, it happens that in regard to many of these events which are absolutely uncertain in any one particular case—such as the time of death or the amount of loss from fire or storm—a very large amount of information as to their average occurrence in the future can be derived from a careful examination of the past.

We see from the above graduated series of assertions, that expectation of any future event may vary from positive certainty that it will not happen, to an equal certainty that it will. The estimate of the probability of its happening may be greater or may be less, and therefore, like all things which are susceptible of being considered as greater or less in quantity, must be also susceptible of being estimated numerically. It must, for instance, be a reasonable thing to say that we expect some one event twice as much as we expect some other. The expectation of future events, in themselves uncertain, is thus brought within the domain of mathematical science, and the application of mathematics to the theory of probabilities is one of the most interesting, and certainly not one of the least important of the subjects which lie before a scientific student. The general principles on which the theory is based can be made intelligible without the use of any technicalities beyond those of ordinary arithmetic, and some of its applications are sufficiently interesting and important to claim the attention of our readers.

The numerical measure of the expectation which a person, thoroughly well informed as to the circumstances, entertains of a given future event is called 'the chance' of that event. We must stop for a moment to consider a point which is a necessary preliminary to the numerical measurement of any kind of quantity, namely, the unit in terms of which it is to be expressed. When a lady, for instance, asks for three yards of ribbon at a shop, the number three simply means that the quantity required is to be three times a particular length with which the lady and the shopman are both well acquainted, and which is called a yard. So, in estimating by number 'the chance' of a certain event, we shall have to speak of it as being so many times, or such a fraction of, some quantity of the same kind—that is, some 'chance' which is already well known and definite. The particular 'chance'

which is always taken as unit is that amount of expectation which may be called moral certainty, as, for instance, the expectation that the sun will rise to-morrow. Any other amount of expectation is estimated by the fraction of moral certainty involved in it.

A simple instance in which the numerical measure of a chance is easily ascertainable will make the general principle clearer. Suppose a penny to be tossed into the air and allowed to fall on the ground. It must fall either with the face—popularly known as 'head'—upwardmost, or with that called 'tail.' If the coin be perfectly true and fairly tossed, we expect one of these to happen, just as much as, and no more than, we expect the other. The 'chances' of the two events are therefore equal. One or other of these must happen, the sum of their chances is therefore certainty, and the chance of either happening must be one half of certainty. The unit 'certainty' being understood, the chance of 'head' falling upwardmost is thus numerically represented by  $\frac{1}{2}$ . Similar considerations show that if an ordinary six faced die be thrown up, the chance of its falling with any one particular number upwardmost is represented by the fraction  $\frac{1}{6}$ , it being equally likely that any one face should be upwardmost, and the sum of the chances of all the faces being obviously certainty.

In many cases, much more complicated than the preceding, it is possible to calculate the chance, if not with perfect theoretical accuracy, yet with sufficient approach to it for practical purposes. The chance of a person of a given age living for another year is computed by comparing a large quantity of observations of the mortality of persons under similar circumstances in the past. The chance of a house being burned down can be found from statistics of the number of similar houses annually destroyed by fire, and so on. We may take it for granted that in all cases in which there is sufficient inducement to undertake the calculation, the chance of any event can be, at least approximately, numerically investigated.

The chance of what we may call a compound event—that is, of the concurrence of two independent events—can be determined in terms of those of the independent events. Suppose, for instance, that two persons simultaneously toss up, the one a penny, and the other a six faced die. Twelve different relationships of penny and die to each other, may happen. The 'head' may be upwardmost on the penny along with the one, two, three, four, five, or six on the die, or the 'tail' may be upwardmost along with any one of the same numbers. All these events, as far as we know, are equally likely. The chance of any one of them, as, for instance, 'head' and 'one,' being both upwardmost, is therefore, as before, one-twelfth of certainty, and is numerically represented by  $\frac{1}{12}$ . The separate chance for 'head' being upwardmost is  $\frac{1}{2}$ , and that for 'one' is  $\frac{1}{6}$ . Now  $\frac{1}{12}$  is  $\frac{1}{2}$  of  $\frac{1}{6}$ . Here we see that the numerical measure of the chance of two independent events both happening, is simply the product of the numerical measures of the separate chances of those events, and this rule applies universally. In this way, the chances of very complicated combinations of circumstances can be calculated,

provided we can first ascertain the chances of the single circumstances separately.

It may have occurred to the reader that, granting all that has been said, the statement, that the measure of a certain chance is  $\frac{1}{20}$ , is a very unimportant one, and that no practical useful inference can be deduced from it. It is true that, as regards any isolated fact of the kind referred to, this objection may hold, but when we come to deal with a large number of similar facts, we are able to deduce a very important practical inference from the numerical measure—namely, that the frequency of the occurrence of any event is directly proportional to the chance of the event happening, and becomes more and more accurate, so, as the number of cases considered is increased. For instance, the statement that when a coin is tossed up in the air, the chance of 'head' turning up is  $\frac{1}{2}$ , gives us very little information of value as to what will happen at the very next toss of the penny. The real inference to be made is, that if the penny be thrown up a very great number of times, 'head' will be upwards in nearly half the throws, and further, that this is more and more nearly exactly the case, the larger the number of experiments. Of course, this, like all other cases of 'hickhoo', reduces itself to a question of experience. In a small way, any one on a leisure afternoon can verify it for himself by actually tossing a penny several hundreds of times and making the results. On a much larger scale it is verified by the continued existence and prosperity of the Life Assurance Companies, the whole of whose capital and income depends on the truth of the principle, that in the long run, events do happen in proportion to the numerical measure of their chances, those chances being calculated by observation of past events of a like kind. If any one will take the trouble to examine the 'tables' of the long established and respectable Insurance Companies, and see how enormous a sum of money is invested and profitably employed in confidence in this principle, he will not hesitate to allow that for practical purposes we can wish for no more convincing demonstration of its truth.

We are all familiar with the fact, that some prospective advantage which we have a chance of obtaining may have a very tangible value at the time, even though we are by no means certain that the reality will ever come to us. A school boy often finds that his position among his school fellows is temporarily raised when a rumour is spread that a rich relative, who will probably give him a guinea or some still more magnificent 'tip,' is about to visit the school. The phenomenon of persons in actual comparative poverty being received into society and successfully exacting deference, on the strength of expectations from wealthy and aged relatives, is not a rare one. In all such cases there is a real value attached to the expectation of some day possessing money which may yet never come to the expectant, but the magnitude of this value is apparently a very indeterminate quantity. In the problem, too, the theory of chances comes to the rescue, and asserts that the value of the expectation of a sum of money is to be measured by the value of the sum of money multiplied by the chance of getting it.

A simple example will again be the best method of making this clear. An enterprising tradesman, not too particular as to high morality, wishes to get rid of some article of which the value is twenty pounds. He proposes to do this by means of a raffle with twenty tickets. Each buyer of a ticket has a chance of getting the whole, and as there are twenty of them, and all have an equal chance, the numerical measure of the chance of each must be one twentieth. It is farther evident, that if one person were to buy all the tickets, he ought to pay twenty pounds for them, and therefore, supposing the tickets separated, the value of each must be one pound. This is obviously the lowest price which the tradesman can charge without certainty of loss. The value of each man's expectation of the prize of twenty pounds is therefore one pound—that is, one twentieth of twenty pounds. In other words, the value of the expectation of the prize is obtained by multiplying the value of the prize by the chance of getting it.

Thus we may call the mathematical value of expectation. It is the price which a person of unlimited wealth might safely pay with a tolerable assurance that if he repeated the process a great number of times, he would not be much a gainer or a loser in the long run. It forms the basis of the price which an Assurance Company will take to guarantee the payment of a sum on the death of the assured, or an annuity during his lifetime. The moral value of the expectation—that is, the price which a person of limited means might fairly pay without prospect of serious loss—we shall consider presently. We may, however, be quite sure, to begin with, that it will not be greater than the mathematical value.

It has been a favourite delusion that fortunes may surely be won by perseverance in the purchase of tickets in lotteries under government or other influential management. It has been an equally persistent and better founded opinion on the part of governments more anxious to raise money than to promote the moral well-being of their subjects, that these same lotteries are capable of being a source of considerable gain to their promoters. These views cannot both be sound, for a lottery creates no wealth, only alters its distribution. It is worth while to apply the preceding principles to examine which is the sounder idea of the two.

Let us suppose a series of lotteries independent of each other in each of which there is a single prize of twenty pounds, and for each of which there are twenty tickets. A man taking a ticket in one of these, and paying one pound for it, has a chance, measured by the fraction one twentieth, of winning the corresponding prize. In accordance with the principle laid down already, that events happen in proportion to their mathematical chances, he will therefore, if he repeats the experiment frequently, win the prize in about one out of every twenty lotteries in which he engages. He will thus on the average receive back one sum of twenty pounds for every twenty separate pounds that he pays. Of course he may win the prize the first time, and if he stop then he will leave off richer than he began, but experience shows, first, that it is very unlikely that the prize will fall to him in this easy way, and secondly, that if it do so fall, it is all but

certain that this first success, as shall be seen presently, will lure him to go on until he loses both what has been gained and his original capital too. The possibility of what we have called 'the best prospect' depends on the assumption, that he continues to buy tickets under all circumstances, though it must be borne in mind that he may be unable to do this, if, owing to a run of ill luck, his funds are exhausted. This is a very serious contingency, and one sure to arise if the gambler continues long enough at his pursuit.

By the methods previously hinted at, it is possible to calculate the chance that in any game or series of lotteries whose laws are known, any given player shall within a certain number of times have either won or lost any sum of money whatever. It is found by such calculations, that if a player keeps on long enough, and the stake played for be any sensible portion of his means, it is a moral certainty that at some time or other he will have gained a sum equal to his original capital, and an equal certainty that at some other time he will have lost the same amount or more. The difference between these two events is this, that whereas the loss runs all but certainly only once, as we have already remarked, to stimulate his gambling ardour, the latter event stops his further progress, and he is thus unable to take advantage of that long run which might chance to restore him to his former state, hence, in a word, he is ruined. The mathematical value of the expectation of a prize is therefore more than in individual of limited means can afford to pay, because the continued disbursements will almost certainly ruin him.

Thus runs prize 19, however, less than the promoter of the lottery or the proprietor of the gambling table can afford to take. If, for instance, in the lottery with one prize of twenty pounds, the twenty tickets were sold for a penny apiece, there would be no gain to the promoter, and as such lotteries are always arranged in order to give profits for some purpose, it follows that the tickets must be sold at more and probably much more than their mathematical value. In the case of the proprietor of the gambling table, who does not merely undertake to distribute a certain sum in prizes, but offers to give a prize whenever certain conditions are fulfilled by a rolling ball, a thrown up die, or other similar apparatus, another consideration comes in. The table may have a run of ill luck as well as the player, and may be even temporarily 'broken' by some lucky player, in accordance with previous statements, it must have such occasional runs if the play be continued. Calculation, however, proves that it is absolutely necessary for the proprietor to make each player pay some definite proportion more than the mathematical value of the throw, in order to secure ultimate gain to the proprietor. As a matter of fact, all gambling tables, as well as all government lotteries, do avowedly charge much more than the mathematical expectation, and thus the prospect before the habitual player is an adverse one.

To return to our lottery with twenty tickets and one prize of twenty pounds. Practically, a ticket would be sold for more than a pound, suppose we say for a guinea. On an average, a purchaser wins once in every twenty attempts.

He thus pays on an average twenty guineas for every twenty pounds he wins, and is assured of ruin by the mere effects of perseverance, even without the occurrence of any serious run of ill luck, such as was necessary on our former supposition.

## BENJAMIN BLUNT, MARINER.

### IN THREE CHAPTERS.—CHAPTER II.

MR BENJAMIN BLUNT, accompanied by Phil Gaylor, had not left the house more than three or four minutes, when the bedroom door opened, and Lady Janet Trevor issued forth. She was a woman of four or five and twenty summers, tall and fur, with a sort of sweet staidness about her which was part of Nature's dower, and would have been equally hers had she been the daughter of a peasant. Her long fur hair was unbound, and fell below her waist, confined only by a single ribbon. Her face was paler than usual this morning, and her eyes, of a blue as tender as the blue of April skies, and fringed with long dark lashes, were anxious and troubled. She was simply dressed in a robe of thick blue serge.—Ruth had washed some of the sea water out of it, and had dried it before the fire in the middle of the night, but Lady Janet did not know that.—and had a soft, white, fleecy shawl of Ruths knitting thrown loosely round her shoulders. As she came slowly forward, Ruth thought that in all her life she had never seen so lovely a vision. 'How plain and mean I must look by the side of her,' and she said to herself with a little feminine pang. But she didn't in her own way and in her own place, Ruth was as natural and charming as Lady Janet was in hers, but then Ruth didn't know it.

'My husband—Mr Harry Trevor—is he— is he?— You told me last night that he was safe, or did I only dream it? One hand was pressed to her heart, the other gripped the back of a chair. Her blue eyes were fixed on Ruth with a pathetic insistence that touched the other to the quick.

'He is quite safe, my lady.'

'Thank heaven for that! I ask nothing more than that.' Her voice was low, soft, and musical, with the clear intonation of a bell.

'He was taken from the boat to the hotel, said Ruth. 'My Phil saw him there only half an hour ago.'

'I must go to him at once! I long so much to see him.'

'He told my Phil that he would be up here in an hour's time. Had not your Ladyship? Her what till he comes?' Ruth wrothly refrained from saying anything about the cruel arm or the doctor's orders.

'Perhaps you are right,' replied Lady Janet. 'But you don't know how impatient I am to see him.'

Ruth placed a chair for her, and she sat down. 'Your Ladyship will have some breakfast?'

'Just a cup of tea, please nothing more.— That terrible scene last night!' she said with a shudder. 'If I live to be a hundred, I shall never forget it.'

There was silence for a minute or two. Lady

Janet sat gazing into the fire, living over again in memory the events of the previous night. Then suddenly turning to Ruth, she said: "It was my fault that we so nearly lost our lives last night. We had been travelling in Norway, my husband and I. When we got back to Christiania, we intended coming home by the ordinary steamer, but a friend of Sir Harry's, a merchant out there, offered us a passage in his schooner, *The Fussy*, saying that she had plenty of cabin accommodation, that there would only be one passenger besides ourselves, and that a voyage by her would be a change from the monotony of a steamer. My husband was doubtful about accepting the offer, and it was only in consequence of my persuasion that he at length agreed to it. If we had only gone by the steamer, as he wished! But one can never foresee what will happen."

At this juncture Ruth betthought herself of the locket and chain, and was crouching towards the chimney pipes to get them, when Lady Janet's next words arrested her. "It is very thoughtless of me," she said, "but for the moment I really forgot to ask you what became of the captain and the poor sailors whom we left on board."

"They were rescued by the lifeboat from *Redcliffe*, four miles away. As soon as my father found the schooner was in danger, he sent a messenger on horseback to the lifeboat station, but he was so afraid the schooner would break up before help could reach her, that he made up his mind to try what he could do with his own little boat."

"God bless him for it!" ejaculated Lady Janet fervently.

Ruth took down the locket and chain and offered them to Lady Janet. "These were found by my Phil this morning in the boat. I presume they belong to your Ladyship?"

"Yes, they are mine," was the eager reply, as Ruth placed them in her hands. "Thank you so very much. This locket contains a likeness of my grandmother—the only relic of her that I have. I would not have lost it for a great deal." Perceiving that the chain was broken, she placed the trinkets on the table at her elbow. "But your mother—shall I not see her before long?" she said to Ruth.

"I have no mother. Both my father and mother were drowned at sea."

"I am so grieved if I have said anything to pain you." But that brave old man to whom my husband and I owe our lives—surely I heard you call him "father" last night?"

"I am only his adopted child. He saved my life seventeen years ago, as I saved your Ladyship's last night. My father and mother were both lost. Nobody knew anything about me, only that my name was Ruth Mayfield. They said I must go to the workhouse. But Benjamin Blunt was there, listening to it all. "I saved this child's life," he said, "and if nobody else owns her, she belongs to me. I've got neither wife nor child of my own. She shall come and live with me, and be my daughter." And here I've been ever since."

"A romance of real life. And I've no doubt Mr Blunt loves you as well as if you were his own child."

"That I'm sure he does. And as for me—it

isn't in human nature to love him better than I do."

"My husband and I owe our lives to him. How shall we thank him sufficiently? What can we do to repay him? Tell me, Ruth—you will let me call you Ruth, won't you?"

"Nobody ever calls me anything else."

"You must tell me, Ruth, before Mr Blunt comes in, in what way we can best show our gratitude. Sir Harry is rich and has influence in many ways."

"Your Ladyship must excuse my saying so, but I don't think you can do anything for father. He does not want for money. This cottage is his own property, and he has saved something besides for a rainy day."

"Surely there must be some way of recompensing him, though only in part, for the great debt we owe him."

"There's a poor widow in the village, Mrs. Riley by name, whose husband was killed the other day, leaving her with several young children. If your Ladyship could do anything to help them, that would please my father best of all."

"I will speak about it at once to my husband. But I am anxious to do something for Mr Blunt himself, or at least for him, then for you."

Ruth shook her head gently but gravely. "I don't think there's anything your Ladyship could do for us—unless you were to send us your likeness as a keepsake. Both father and I would be very proud of that—but here comes father himself," added the girl, with a glance through the window. "Perhaps your Ladyship will talk to him."

A moment later, the front door was opened, and Blunt came slowly in, supporting on his arm a very old, old man, as dried up and withered as a Normandy pipkin. He wore a deep crape band on his hat, a broad-skirted coat of coarse blue cloth, and knee breeches, thick gray homespun stockings kept warm by his poor thin shoes. His eyes had the intelligence and vivacity of a far younger man, and his snow-white hair was still plentiful.

Lady Janet rose and stood back a little, while the two men slowly crossed the floor. Not a word was spoken till the old gentleman was safely deposited in Ben's own armchair in the chimney corner. Ruth took advantage of the diversion to retire into the back parlour on domestic thoughts intent.

"Mr Blunt, I believe!" said Lady Janet as Benjamin turned and faced his guest.

"Old Ben Blunt, at your Ladyship's service," and with that he took off his hat and made a low old-fashioned bow.

Lady Janet advanced a step or two and held out her hand. "How can I thank you, Mr Blunt—how show my gratitude sufficiently for the great service you have done my husband and me?"

Ben gazed on the white slender hand for a moment, then, after giving his own brown hand a furtive rub with the tail of his coat, he took hold of it gently, almost reverently, but Lady Janet's fingers closed warmly on his as her eyes filled with tears.

"That pays for everything," said Ben huskily. "Nem yours pretty face, I should like to see the man as wouldn't go through fire and water,

rather than a hurt of your head should be hurt."

"All men are not such heroes as you, Mr Blunt."

"Mr. a hero! I hardly know what the word means. I'm only a simple ignorant old fellow, who tries to do his duty according to the light that's given him." Then, seeming to think that enough had been said on so trivial a subject as himself, he stepped back a pace or two, and pointing to the old gentleman in the arm chair, he said: "Will your ladyship allow me to introduce you to my notice Jim Rakya's father? Jim here! He was run over six weeks ago and was killed to-day on grandpa's birthday. He was smothered at twenty minutes past one this morning, and we're all very proud of him. They can't show such another old man for twenty miles round. By and by, he and I are going to have a drop of something, but a pipe o' buccy." Then turning to the old fellow and elevating his voice a little, he called: "We always do have a drop of something hot on your birthday, don't we, grandpa?"

"Ay, ay, lad, that we do," responded Riley in the thin piping tones of extreme old age. "We've done it for twenty years, and we're not going to give up a good old custom at our time o' life."

Lady Janet crossed over and shook hands with the veteran. "I am charmed to make your acquaintance, Mr. Riley," she said, "and I hope with all my heart that you will live to enjoy many more anniversaries of this day."

"Thank you, mum, thank you. It's nearly six years this very day since I came into the world, but I'm here yet—I'm here yet!"

"And likely to be for another twenty years," remarked Ben in his cheeriest voice. Then turning to Lady Janet, he added: "Will your ladyship excuse me for a minute while I take off my Sunday collar? I don't seem to talk easy in it. Not but what this sort of collar has its uses in times. Nobody can say it isn't respectable, and when it's got up stiff and proper, I'll defy anybody to go to sleep in church who's got it on." And with that, exit Ben into his bed room.

Lady Janet drew up the three-legged stool and sat down near the old man. "Do you and Mr. Blunt have known each other for twenty years?" she said.

"Yes, mum, for twenty years—ever since he came to this village. He's a little chap, and there ain't much of him, but he's got the heart of a lion. He's like Admiral Lord Nelson—he don't know what fear is."

"You have had a great misfortune lately, Mr. Riley."

"Meaning in the death of my boy. Yes, mum, it will be six weeks come next Tuesday since he was run over and killed. But, somehow, I don't seem to fret much after him. Maybe I'm too old to fret. I know I can't be long after Jim, and somehow it don't seem quite so lonesome for me to look forward to now. I know he's there awaiting for me, and when I sit on the porch and watch the sun going down yonder in the west, it seems to me that Jim and I can't be far away from one another."

Lady Janet took out her handkerchief and made a

note or two. "I must get Harry to do something for these poor people," she said to herself.

The old man had risen to his feet and was fumbling nervously in the capacious pockets of his coat.

"Have you lost anything, Mr. Riley? Can I assist you in any way?" asked Lady Janet.

"I was just trying to see what I've got in my pockets. Everybody in the village knows it's my birthday. As I came down the street just now, little toddling lads and lasses came out of the cottages and wished me 'Many happy returns.' And some of them—Heaven bless them!—dropped little things into my pocket—boys and what not—all they had to give—because it was old grandpa's birthday. Here's a pegtop. Little Billy Johnson gave me that. Ah! I shall never swap pegtops again in this world. This doll is Peggy Dawson's. The poor thing was crying and And here's a paper of sweet stuff and a fastidius. And this is Jocky Taylor's big silky tow. I shall keep them for a day or two, and then give them all back again."

At this moment Mr. Blunt re-entered the room. He had got rid of the famous collar, and was his own free and easy self again. "Would your ladyship like a little rum in your tea?" he asked.

"No, thank you, Mr. Blunt."

"Many ladies like a drop in their tea. I thought that maybe it was just a nibble to drink 'em to, either."

"When you were in the hotel just now, Mr. Blunt, did you see my husband, Sir Harry Riley?"

"I didn't see him, but our Flid did. He said that he would be up here in about half an hour or thereabouts."

"Oh, Mr. Blunt, if Sir Harry and I could only show our gratitude in a nice way."

"Your ladyship couldn't show it better than by eating a good breakfast and bringing back the roses to your pretty cheeks. We've a nice lump of cold beef in the cupboard. I can't think why Ruth didn't bring it out. And if Sir Harry and you would only stop to dinner, Ruth should make one of her potato pies. You would say it was grand. I'll back our Ruth against anybody for potato pies and panada."

"I must hear what my husband has to say," answered Lady Janet with a smile. She was putting down her cup and saucer, when her elbow accidentally swept the chain and locket off the table. Ben stooped and picked them up.

The lady opened the locket and handed it to Mr. Blunt. "That's the portrait of my grand mother, taken when she was eighteen. Tell me, Mr. Blunt, whether you think it in any way resembles me?"

The old fisherman's eyes were no longer so strong as it had once been. He took the portrait to the window, that he might have a better view of it. "That's her grandmother!" he muttered under his breath, while all the color had run out of his face. "Why, it is the very face of my own lost darling! The name, too—Janet! No, no, such a thing is not possible!"

"By your silence, Mr. Blunt, I suppose you cannot detect any likeness?"

Ben came back from the window, and standing close in front of Lady Janet, he scanned the sweet, smiling face before him closely. "There is a

likeness, Lady Trevor, a very wonderful likeness," he said with a strange quaver in his voice. "You—you say that this is the portrait of your grand mother?"

"Yes—of my grandmother, who died many years before I was born."

"Ah!" He restored the locket to her. Then resting his hands on the table and with his eyes fixed earnestly on her, he said "Lady Janet Trevor, don't think me mad, don't think me impudent to ask such a question—but what was your name before you were married?"

"Janet Reiskin."

He sank into a chair and hid his face with his hands. "Her mother's name before she married me!" he murmured. "It is she—my own darling—the angel whom I thought never to see on earth again! And it was I who saved her life! O heaven! I thank thee for this!"

Lady Janet had risen to her feet, and was gazing at him with anxious wistful eyes. "You are agitated—you are ill! What can I do for you? Shall I procure help?"

"No, no, it is nothing. I'll be better presently." He rose and crossed to the window, and stood gazing out with his back to the room. Lady Janet watched him wistfully. What could have moved the stout hearted old fisherman so strangely?

Ben was communing with himself. "The same hair and eyes—the very same! I earned her in my arms last night from the boat, and never knew that it was my own child! But I must remember my promise. Yes, yes, that must not be forgotten."

### SOMETHING ABOUT PAPER

It has been proposed to call the present the 'age of paper,' and when we consider the amount of this material which is being continually produced from rags, straw, wood, jute, rice, &c., the name would seem appropriate enough. There are said to be nearly four thousand manufacturing of paper distributed over the globe. These produce, it is calculated, some eighteen hundred million pounds-weight per year. Half of this quantity is employed for printing purposes, a sixth for writing purposes, and the remainder for various uses. The paper used for newspapers alone represents, it is said, a surface exactly double that of Paris within its present limits. Since the discontinuation of the tax and other causes, we are told that more than five hundred new periodicals started in France in 1881.

The paper manufacturers of the world employ, it is stated, ninety thousand men, and one hundred and eighty thousand women, and besides these, one hundred thousand persons are engaged in collecting rags. The importation of esparto grass from Algeria for paper-making purposes has reached vast proportions. It has been pointed out that should war in that country very much reduce the supply, manufacturers might experience great difficulty in finding a substitute. Even if they found one, it might be of a kind requiring expensive changes in their machinery.

We are reminded that some years ago samples of a material, the supply of which would at least equal the esparto supply, were shown to paper makers, but though they were satisfied with its suitability in every respect but one, they could not adopt it, because that one defect was that their machinery was not adapted to its manufacture.

China and Japan are, as is well known, great producers of paper made from rice. How paper is there utilized, we have an example from the experience of the clever authors of *A Voyage in the Siam*. The Japanese are described carrying paper umbrellas and the *jurikidas* wearing large hats and cloaks either of rods or oiled paper, besides oiled paper hoods and aprons as protection from the sun. These ingenious people are also said to employ paper instead of india rubber for making air cushions. Paper cushions roll up smaller than india rubber ones, they do not stick together after being wringed, and having no odour, they are more agreeable for pillows than those of cork-hobbed silk. Their strength is marvellous, considering the apparent frailty of the material out of which they are made, a man weighing one hundred and sixty pounds may stand on one without hurting it. They are said to be water proof too, and to make good life preservers. The Japanese are, it seems, as clever in the manufacture of the tougher sorts of paper as the finer. One of their latest achievements in this line, we are told, is the production of a paper belt suitable for driving machinery. Now that European machines are being adopted in that country, this invention will prove exceedingly useful, for the Japanese are inferior tanners, and do not make good leather.

Though paper is not utilized in Britain quite in the same way as it is amongst the Japanese, recent Exhibitions have shown what an important part this material can play in the furnishing and decoration of our homes. A mode of hanging paper on damp walls, not long since patented in Germany, may here be mentioned. Lining paper coated on one side with a solution of shellac in spirit of somewhat greater consistency than ordinary French polish, is hung with the side thus treated towards the damp wall. The paper hanging is then provided with the usual way with putty. Any other kind of resin easily soluble in spirit may be used instead of shellac. A layer of paper thus saturated with resin is said to be equally efficient in preventing the penetration of damp. It is not stated how long lining paper in the manner described will adhere to a damp wall, but the experiment in our damp climates is worth trying. Another authority informs us that a strong impervious parchment paper is obtained by thoroughly washing woolen or cotton fabrics so as to remove gum, starch, and other foreign bodies, then to immerse them in a bath containing a small quantity of paper pulp. The latter is made to penetrate the fabric by being passed between rollers. Thus prepared, it is afterwards dipped into sulphuric acid of suitable concentration, and then repeatedly washed in a bath of aqueous ammonia until every trace of acid has been removed. Finally, it is pressed between rollers, to remove the excess of liquid, dried between two other rollers which are covered with felt, and lastly disencumbered.

Two new kinds of preservatives of paper have

lately come into commerce. One is said to be produced by dipping soft paper in a bath of salicylic acid and then drying. The bath is prepared by mixing a strong solution of the acid in alcohol with much water. The paper is used for covering apples, &c. The other paper, meant to preserve from moths and mites, consists of so called Manila packing paper dipped in a bath and dried over heated rollers. The bath is formed of seventy parts spirit of tar, five parts raw carbolis acid—containing about a half of phenol—twenty parts of coal tar at one hundred and sixty degrees Fahrenheit, and five parts refined petroleum.

A method of whitening all newspapers has, we are told, been discovered by M. Jougla. He asserts that he can so cleanse printed paper as to make it suitable for receiving a fresh impression. His way is that by immersing the printed sheet in a slight alkali solution, the ink disappears, and leaves the sheet of a pure off-white.

A French newspaper tells us that a chemist has succeeded in tinning linen, cotton, or paper fabrics by the following process. Mix a pound of zinc powder with a solution of albumen, then spread this mixture on the stuff by means of a brush. After drying, the layer is fired by passing the cloth or paper through dry steam, in order to coagulate the albumen. The stuff or paper is then passed through a solution of chloride of tin. The metallic tin is reduced to an extremely thin coating on the fibre. The material thus prepared is then washed, dried, and rolled.

We learn from another source, that for the production of malleable or mool paper, in which the various tints of colour are not limited by shreds of hue, but pass so softly into one another that the boundaries are not recognised, Herr Gumbler, of Dresden, uses an improved rollers made of ebonite or other elastic material, instead of metallic ones. Their diameter is determined by blowing in air fluid vulcanised ebonite is unsuitable for the purpose. The rollers have wooden cores at the ends, over the edges of which the ebonite is turned, and fixed with glue and wire, so as to make the rollers air tight. A hollow axis enters one end, and through this the air can be blown.

The use of paper machinery which has before been referred to in this Journal. We now learn that wheels of this description are becoming every day more general in American railways, and that they are now being used in Europe. In the first ten months of last year we are told that one firm alone turned out considerably over seven thousand of these wheels, which are stated on good authority to be the most economical as well as the only safe kind of wheels for passenger carriages. It appears that in the first instance they are much more costly than iron wheels, but that they last far longer.

To the wonders already achieved by paper machinery is now added the invention of a novel fire escape. This latest invention for the protection of theatre audiences is a 'penetrable safety wall,' which has been patented by an engineer in Germany. The plan is to make the interior of walls in all parts of the theatre of paper maché, made after a certain method. Such a wall would have the appearance of massive stone, but by pressure upon certain parts, where the words are

to be painted in luminous letters—'To be broken open in case of fire'—escape to the exterior corridors is to be obtained, when escape to the outside air can be made.

## ECCENTRIC PHRASEOLOGY

Some writer has affirmed that the English language has a power of expression such as is not equalled in any other language. We shall take advantage of this declaration—from a humorous point of view—and endeavour to verify the truth of this observation by the introduction of a few examples.

A gentleman saying to a lady in conversation, 'You know, madam, that you cannot make a silk purse out of a sow's ear,' was met with the reply 'O good gracious, sir, if you will permit in using such an odious specimen of vulgarity again, pray, clothe it in more pleasant phraseology. Just say it is impossible to fabricate a pecuniary silkener acceptable from the auricular organ of the softer sex of the genus swine.'

We eventually live in wonderfully refined times. For instance, a learned young lady out evening strolled a company by asking for the loan of 'a diminutive, argentine, truncated cone, covered on its summit, and semi-perforated with symmetrical indentations'—she wanted a thimble.

'He goes on his own hook,' has been rendered more elegantly, in reference to and in accordance with the spirit of the times, in this manner: 'He progresses on his own personal curve,' and a barber in London advertises that 'his customers are shaved without incision or laceration for the microscope sum of one halfpenny.' One might have heard a pun fall in a proverbial expression of silence, but it has been eclipsed by the French phrase, 'You must have howl the unfolding of a lady's combette pocket her therelief,' and so it is somewhat vulgar to say 'pith darkness,' it has been so improved as to read 'bituminous obscurity.' Another polite way of expressing the fact that a man is naturally lazy, is to say he is 'constitutionally tired,' and 'Nominato your person,' is the poetical way of asking, 'What will you drink?'

On one occasion, we are told, a doctor of divinity rung the changes on 'He that hath ears to hear, let him hear.' 'He that is accessible to auricular vibration,' said the doctor, 'let him not close the gates of his tympanum.' Then again we have that old-fashioned saying, 'The more the merrier,' delightfully translated in this way, 'Multitudinous assemblages are the most provocative of each other's hilarity.' It is even reported that not very long ago a clergyman spoke of being a young lady 'with the pearl drops of affection hanging and glistening on her cheek.' He meant that she was crying. Certain critics, too, occasionally launch out in a similar metaphorical style. Concerning a young and aspiring orator, one wrote 'He broke the ice felicitously,' and was immediately drowned with applause.

Quite recently, a literary man of some celebrity, in a letter describing the early fall of snow in Switzerland, did not say the storm abated, but 'the flakes dwindled to floculi,' and instead of vulgarly putting it that they melted a potful of snow to obtain water, he said that firewood was

Take the following as an instance. A rich but ignorant lady, who was rather ambitious in her conversational style, in speaking of a friend, said, 'He is a paragon of politeness.'—'Excuse me,' said a way mixing next to her, 'but do you not mean a parallelagram?'—'Of course I do,' immediately replied the lady 'How could I have made such a mistake?'

It is well, by the way, to bear in mind a celebrated maxim of Lord Chesterfield's, which runs thus 'It is advisable, before you expatiate on any particular virtue, and give way to what your imagination may prompt you to say, to ascertain first whom you are speaking to.' The following will exemplify the necessity of this precaution. 'My dear boy,' said a Lady to a precocious youth of sixteen, 'does your father design you to tread the intricate and thorny paths of a profession, the straight and narrow ways of the ministry, or revel in the flowery fields of literature?'—'No, mamma, did says he is going to set me to work in the 'tater field.'

Such precise conclusions must be very disheartening. They are, however, amusing, as another example will show. 'Behold, my adorable Angelina,' observed a poetical swain, 'how splendid, how magnificent, and how truly glorious, nature looks in her bloom! The trees are filled with blossoms, the air resounds with the melodious singing of birds, the very wood is dressed in its greenest of liveries, and the gorgeous plain is carpeted with grass and innumerable flowers!—'Yes, dear Charles, I was just thinking of the very same thing. These plants in particular that we see around us are dandelions, and when they are gathered and put into a saucepan with a piece of good fat pork, they make the most delicious greens in the world.'

If, however, we should desire to become better acquainted with a more exaggerated style, we shall find it to be most prevalent on the other side of the Atlantic. A more cautious method of inquiry to ascertain the truth can scarcely be conceived than that once taken by a barrister in cross-examination, a witness 'Were you not, on the night on which you say you were robbed, in such a state of vicious excitement as to preclude the possibility of your comprehension of your situation with that accuracy and precision necessary to a proper delineation of the truth?' And again, a New York obituary goes thus: 'Another stalwart tree fell last evening in its autumn prime, in the person of Major Cullen, as unique and remarkable a character in his way as ever wrought out by arithmetically, and emarginated from the rugged latitudinarianism of the frontier.'

A most fearful picture, at first sight, was that presented by a member of a debating society. 'Mr President,' said he, 'our country's fate looms darkling before us, without a star above the horizon on which the palest meteor can hang a scintillation of hope, but with ominous features of fast coming doom, gloomy and rayless as the eyes of a tree toad perched upon the topmost bough of a barren poplar, enveloped in an impenetrable fog.'

A more cheerful announcement was made by a Massachusetts mayor, who said in his annual message, 'As the eastern horizon of the present

is made glorious with the beaming rays of opportunity, so may the sunset hour of the future, by the reflexive influences of faithful duty, greet us with its gorgeous panoply of promissory light.'

An extract taken from a Louisville paper is a fine example of American laudation. 'When Miss Howson first appeared, her bright eyes and lovely face attracted everybody, but when her beautiful pearly teeth were disclosed, there came such a cataract of diamond drops of milk, that the house seemed, as it were, deluged in a spray of harmony, equal to that which one might imagine would come from a Niagara composed of Arabian harps.'

Other descriptions of a like character are not always so flattering. Here we have what is called high toned criticism in Pennsylvania. A contemporary, speaking of a songstress, says 'She beats cats on high notes. There was no music or chest tone in her voice, but it was about six octaves above the screech of a live Indian, and would have thrown out of concert with itself an enterprising railway whistle. The very chindlar would quiver, making every nervous man who sat immediately beneath, instinctively raise his hand to protect his scalp, these magnificent notes being followed up with a roar that would silence a boom.' And in an article upon the aurora borealis, a scientific gentleman in Illinois thus gives the origin of this celestial spectacle. 'When the mololyptic temperature of the horizon is such as to calumniate the majesty of the hemisphere analogy, the hecession of the boxer dubitus becomes surmounted with infinitesimals, which are thereby deprived of their usual distinctions. This effected, a rapid change is produced in the thorumbumper of the gyaditus palerum, which causes a convulsion in the hexagonal antipathies of the terrestrial aqua verus. The clouds then become a mass of deodorized spools of laminar light. All of which is doubtless clear to the reader.'

As an example of meaningless phraseology, take the following anecdote of O'Connell in addressing a jury, and having tabulated every ordinary epithet of abuse, he stopped for a word, and then added, 'this nauseous ruffian.' When afterwards asked by his friends the meaning of the word, he confessed he did not know, but said he 'thought it sounded well.' By this admission we are reminded of a certain critic who charged a literary critic with using 'mixed metaphors,' and of an afflicted widower who recorded on the tombstone of his deceased wife that here lay the 'marvellous mother of fourteen children.'

## THE APPROACHING CYCLING SEASON

There are few persons who have not at some time in their lives experienced the feeling of impatience at being debarred by force of circumstances from indulging in some favourite amusement or recreation. On retrospection, former pleasures appear succumbed by an enticing halo of enjoyment, and memory clothes the anticipated future in garments borrowed from the past. To those who are acquainted with members of that numerous body termed 'Cyclists,' the above

remarks will at once strike home, for in no other class of devotees to any particular recreation does the same amount of latent enthusiasm manifest itself. When winter approaches with its accompanying muddy roads and frostily laid macadam, the steel steed is reluctantly consigned to some secure retreat, until the following season. The feeling of regret as a danger is to some extent mitigated by the wish to know what novelties and labour-saving inventions will be produced during the enforced cessation for 'cycling' differs from most other sports in being comparatively new to the public and in constantly presenting fresh phases in all its details. Hence the exhibitions held in the metropolis and the provinces have attracted many thousands of the curious and interested. The issues of invention in all parts of the kingdom have been busy at work devising means whereby the maximum of speed may be obtained with the minimum of friction, and some of the results have been, to say the least, surprising. The ingenious devices now exhibited will not in the future be confined solely to the mechanism by which they were primarily designed, the benefits accruing from them will inevitably attract the attention of engineers, and we may shortly expect to find them embodied in other machinery, stationary as well as locomotive.

There can be no question that 'cycling' is now in its infancy. Three or four seasons ago it required novelties from nearly all classes, then, as it grew in importance and its various merits became known, it was tolerated finally it received support from many of its former detractors, and during the last season became in many parts the rage.

The eminent authority on hygiene Dr Richardson, F.R.S., says 'Cycling for men or young women is one of the most harmless of useful recreations, and is equally good for men and boys of all ages.' With regard to the 'very fat' or persons inclined to become so, he specially points out that these are the persons whose all others who feel the benefits of tricycling most. He concludes by saying 'There is a real pleasure, when the roads are good, in skimming along on a bright day, this has to be experienced before it can be understood, and if the motion be carried out moderately, it is equally a pleasant surprise to feel how easy the travelling is and how fast the ground seems to be traversed. One passes quickly, and the eye collects all that is interesting without dwelling upon objects too long, as in walking and without losing sight of them too rapidly, as in a railway carriage. The power of assimilation; the scenery in this agreeable way is always healthy, it keeps the brain active, without wearying it on the one hand or confusing it on the other, and when the mind goes well, all goes well.'

The medical profession, as a rule, greatly recommends the exercise, and our practitioner in a southern English town, conventionally places many of his patients upon tricycles in the privacy of his pocket, as he frankly confesses, by the loss of flesh which would otherwise subsequently accrue.

At first, a lady was supposed to compromise her dignity sadly by propelling herself upon wheels, but familiarity has now entirely exploded the idea, and not only is no loss of dignity

involved, but the practice encouraged on almost every hand. Many ladies tricycled during the last year over five hundred miles, in some cases, in fact, the distance has reached the four figures, and thus to the great benefit of both mind and body.

The arguments for the coming season are unusually brilliant. The great 'Touring Club' now extends its ramifications to nearly every part of the continent and America, its numbers in its ranks nearly seven thousand members, a goodly proportion being of the fair sex, and gentlemen are selected in all places of interest and importance to point out the 'lions' to the passing tourists. Local clubs show great vitality in deciding upon their future programmes, and cyclists are engaged upon the all-absorbing topic of 'what to wear,' assisted in many instances by the advice of the 'Rational Dress Association,' while their little relatives attend Exhibitions and dines with manufacturers concerning the machine they intend to purchase as soon as the weather permits. This selection is far from an easy task, as the advantages claimed for one class of machine appear in a variety of cases counterbalanced by different advantages in another. However, judging from the rapid sale and great demand in the present time, it would appear that the manufacturers have fairly succeeded in gratifying the particular hobbies and fancies of the public.

We may therefore safely predict a season of unusual activity in travelling and buying, should the weather prove propitious, not only will the main roads and pleasant bylines of our mother country witness the rapidly gliding wheels, but, extending in many adventurous predilections, the quaint old buildings of continental towns will view tourists upon their steel steeds, seeking rest from mental toil, health for the body, recreation for the mind, and experiencing that keen delight and entrancing excitement which only those who know can fully appreciate.

### 'THE LAND AFAR OFF'

A land whereon black winter doth not reign,  
But all day summer, sweet as unto the core,  
Where broken hearts are knit in love again,  
And weary souls shall wander out no more,  
Where bliss is greater for all we before,  
Where fair flowers blow, without earth's sad decay,  
And friendship's happy voices as of yore—  
But twofold dearer—no or again shall say  
'Farewell—b it ever, 'Welcome to this shore!'  
Or 'Hail, tired pilgrims to this golden day'  
And, 'Come, ye blessed, to joys which will not pass away!'

A country in whose light our souls shall bask,  
A goodly heritage—where all we sought  
Of hope, and love and every pleasant task  
Shall centre gladly—far beyond all thought!  
As of old, the Lamb—Who from all evil bought  
His chosen people—shall our eyes behold,  
And graciously as when on earth He taught,  
His voice shall speak again—clear, as of old,  
But with no ring of sorrow in its tone,  
Glad presence, walking in the streets of gold!  
A mighty King, with people all His own!

## DOGS THEIR HUMANE AND RATIONAL TREATMENT

BY CORDON STABLES, &c

IN TWO PARTS.—I IN ENGLISH

TRUE and practical though I mean to be in this paper—for every line of mine is valuable—I feel it my duty, both to my readers and myself, to make one or two prefatory remarks. They shall be brief. The advice given will be taken simply for what it is considered worth, but as a judge at Exhibitions of dogs both in this country and abroad, as well as reporter on such shows for the sporting press, and general writer of books and treatises on the management of all domestic animals, I have had considerable experience. All this might go for little, did I not love dogs, and constantly study their ways and their welfare, and being the owner of a considerable number of canine favourites, that lead a very happy life indeed, because their mode of being treated is rational, I have ample means of doing so. Some of the hints I shall give, and the suggestions I shall make for the better treatment of dogs, may be new to many, but they have been well considered, and are the result of an experience which I have not had to go out of my way to seek.

Since dogs, whose were first fully managured in this country, our canine friends have taken a much higher standing in society, if I may so frame my speech. The breeds have been much improved, and the wish to obtain pure specimens is quite as warm with many people. The highest in the land take honours at such great Exhibitions as Birmingham and the Crystal Palace, and the poorest man in England prizes a well bred dog to a mongrel. Indeed, mongrels are fast being improved off the earth, and I am not sorry for it, if only for the simple reason that, as a rule, a person will treat with more consideration an animal of value than a wretched cur. Do not understand me to mean by the word

'mongrel' a simple cross of one or more breeds. A cross is often of value, but the great object of all scientific breeders now-a-days is to obtain stock in every way suited for the work for which they are designed, so that the points or properties of each breed are not, as the uninitiated often imagine, merely jumbled together. Let only two dogs come to the front to illustrate my meaning. The first is the well-known greyhound, for speed and endurance, good sight, with power to kill and lift a hare, he could not possibly be better shaped. From stem to stern he is made to cut or clear the air through which he bounds—even his chin seems reduced to a minimum for this purpose, and the top part of the nostril points outwardly, his head is long and lean, but sufficient in muscle without, his nostrils but little developed, because he depends not on scent, his voice is high, liquid, and large, and quite exquisite, his ears half erect, catch the slightest sound, his chest wanting in breadth, and thus presenting no resistance to the wind in the forward plunge, but deep, nevertheless, to give lung room and power to 'stay,' his lungs are broad, strong, and muscular for strength he must have—while the extraordinary development of muscles on the hinder quarters gives him propelling power. Add to this, strong legs, good round cat-like feet, a long sharply notched tail which acts as a rudder, and a coat like a silken garment, warm and light, and we have the 'beach and held preparation of the greyhound.

And there is the Highland collie, far from being the shepherd's friend, and often 'his chief mourner,' but now probably the most fashionable of all breeds. I will not go over his points and properties. But one has only to think of the work he does, and the weather he works in, and then glance at a high bred specimen, to understand thoroughly what I speak of.

The dog, every one must admit, is man's truest and most faithful friend, and all right-thinking people must agree that he ought to be most humanely and kindly treated. Let me, then, consider somewhat in detail the most valuable

method of using him in health, with a view to keeping him well.

The last thing one should think about, before either buying a dog or accepting a dog as a gift, is a proper place to keep him in. If he is to be a house dog entirely, he will hardly be so healthy, nor will he live so long as if kept in the fresh open air. But people in towns, or even in villages, are often compelled from want of space to keep indoors the dog that is needed for companionship or protection. In this case, while he may roam about all day and lie down where he likes, provided it be in the shade of the tree, for this is most prejudicial to his health, at night he should be made to occupy a particular kennel. All that is needed is a mat or sack or old rug, but whatever it be, let it be called a bed, so that, when evening comes, the dog may be told to get into his delectable manure to the world. "Go to bed, boy."

An indoor dog should not be expected to lie in a bed, in any dirty place, in a cellar, or upon a brick or stone floor. To make a dog's bed in such spots is cruel and unkind. But to cooille him up in a warm leather bag, or to permit him to sleep on the sofa or on a down bed, is an error in the other direction, for a dog will not be so healthy if so treated, nor, if he is one of the beautifully long coated breeds, will he get so warm in any length of time as to enable him to lie. When many dogs are kept out of doors, they require a special system of kennelling, which I need not describe further than to say it consists of a shelter house with straw covered benches, and a well ventilated and raised kennel, and a fence in front of the run or yard, with a good supply of fresh water.

Where only one or two dogs are kept the chain kennel is usually adopted. I do not like it with chain dogs at all, but I cannot help people doing as it, if only it means for me, then, to make some improvement which honestly demands in the animal out of dog box or basket. The bare floor of the kennel is the most primitive. In its primitive simplicity, it is usually a barrel with one end knocked out and a hole stretched—chain, dirt, damp, and dangerous. But, given a good, strong, strong, hard wood barrel, and one can make a comfortable kennel out of it. Thus we may well first, and let it dry, have the ends closed up, and in the middle near to one end, provide a small round hole by which the animal may ingress and exit. Thus you have at once a kennel, free from objectionable dirt, and all which will lined with straw, it is all that could be desired. The square copper wire kennel is usually the floor in the stable. This is most objectionable by all means, but the opening at the side, and have the back to open when desirable, for the convenience of chain.

The chain should be as long as possible, and if space be plentiful, it is a good plan to have the chain ending in a round ring, and thus rope to run upon a long stretch of strong wire rope, so that the poor dog gets quite a range without being actually free. I have not the credit of inventing this capital plan, I first saw it in America when "judging" there. All kennels should have a wooden floor, and be raised about a foot above the ground.

Kennel bedding ought to be abundant. Quite half fill the barrel or box—it will last the longer

it is greatly appreciated a good bed. Change it whenever damp, and change it at least once a fortnight whether damp or not. The best bedding for winter is straw or ryegrass, the best for summer, when a straw. I do not think shavings so good, and they are bad, because it fills the coat with dust and troublesome insect. Sprinkling the straw with a decoction of quinine wood—two handfuls of chips steeped for a day or two in half a bucket of water—prevents flies. Dampening the straw with this decoction kills these and other vermin. A little sulphur sprinkled over the straw has the same effect. It is a good plan in large kennels to put down a good layer of peat earth, it is a cleanly, wholesome, and disintegrating substance for the bed.

Outlets and dogs should always have an abundance of fresh water for drinking. The pen should be a broad bottomed one, not easily knocked over. The water should be changed every morning, and placed where it shall be out of the reach of the sun. In winter, one should be told that it does not get frozen. For in their ill many dogs receive in large towns have it put the pen of the pen, and it is pure water now the dogs for thirsty dogs to drink from, summer or winter. I do not think they like anything by being kept to drink from. Will there be any more would fill with them example. If so, we should have fewer bad dog parks than, unfortunately, there are at present. People, however, are beginning to know that muzzling dogs in summer, or depriving them of exercise by shutting them up, is as likely to produce them patients that it will do us good.

It is a few words about food and feeding. It is not the best food. It is usually a problem to much as to eat for his own health and comfort, and he will eat all kinds of the dirt, and often in large quantities, such as sugar, peas, and all the sweet eatables, and other things, and it is peculiar to him. People are even quite as sometimes given to them, and I could cite cases of dogs that have been well become inebriated drunkards, finding ways and means of obtaining intoxicants that were astonishing.

A dog should be fed twice a day. I purposely state the word "twice," it is with a view to the fact that it should be fed at night, it is a necessity of healthful existence. If it be not, even, the bowels become clogged, the bile is expelled into the stomach, the dog gets gassy, and he is unwell in a natural way of what nature designed in the system. A bit of dry dog biscuit, or a drop of milk or cream of sheep's milk, is all my own dogs ever have for breakfast.

A dog should have his principal meal—with a run to follow—at four or five o'clock, and at five in summer. Variety and change in day to day are most essential. Dog biscuits, dry or soaked, and mixed with the liquor that fish meat or fish has been boiled in, with now and then a small portion, make a good staple of diet. Bread crusts soaked may be substituted once a week. Meat should be given, but unless the dog has abundant exercise, too much does him. Boiled greens should be mixed with the food at least twice a week, but they should be well mashed, else our friend will edge them on one

side with his nose and have them. Pannicles are good as a chum, so are well baked lights and sheeps head and broth. The hair should be boiled to a jelly, and no kind of meat should be given raw, except now and then a morsel of bullocks liver or milk, to act as a laxative. Never give raw hares—they carry down air into the stomach, and may in later results. Potatoes, rice, and most garden roots are good, and the scraps of the table generally. Much caution should be used in giving bones. On no account give a dog fish or game or chicken bones. Milk when it can be afforded is very good for dogs, and buttermilk is a most wholesome drink for them. Let everything you give to a dog be cleanly and well cooked, and do not entertain the now exploded notion that anything is good enough for a dog. What a dog eats should be thrown to the fowls, and not presented to him again, for the animal is naturally dumb.

If you want a dog to remain healthy, great pains must be taken that, both personally and in all his surroundings, he is kept clean. His food and his water should be pure and fresh, the kennel he lies in should always have clean bedding, and be periodically scrubbed and disinfected. Even the mane of his halber collar should be kept sweet and clean. It ought to be brushed, if not combed, every morning with an ordinary dandy brush. This not only keeps the coat clean and free from unwholesome matter, but promotes the growth of the feathers, as it is called. He should be washed once a fortnight. Washing a dog may seem a simple matter, but there is a right way and a wrong way of doing it, for all that. Here are the directions I should give to a boy.

Choose a fine day. Wash him in the morning so that he may not run the risk of catching cold or inflammation, by going to bed with a damp coat. Place him in the tub, big as possible. Fill the soap in one hand, and pour the water with the other over the dog, as you lather. The water must be warm, but not hot, the latter would on the jacket abundant. Leave the head till the last, else your arm will break out to a shameful red by shaking himself. After he is well lathered and rubbed, squeeze and wash out all the soap first with warm, and finally with cold water. Next give a douche bath in the shape of a bucket or two of cold water all over, and let him run about a minute or two. Shake himself. Now take a rough towel and dry him as well as possible, and then take him out into the air by his collar. You thus get the blood in circulation, and there is no fear of his catching cold. Let him have a bit of biscuit when he returns from his walk, and afterwards turn him into his kennel among good clean straw.

Cold and damp and draughts are very injurious to a dog's health, and it is worth while remembering that if a dog has to be exposed for a time to the wet without the power of running about and keeping warm, he ought to have something to eat. Notably inflammations in dogs are caused by exposure to cold and wet, while the animals are fasting.

In washing dogs, the mistake of using strong alkali soap should be avoided. Some people use soft soap. Nothing tends more to destroy

the gloss of the coat. This gloss is caused by an oily secretion from glands situated in the roots of the hair, and is most likely nature to protect the coat from damp in all climates. If washed off, therefore, there is a tendency towards catching cold, and even skin disease. This may seem a small matter, but it is truly important. Use only the mildest of soaps, the best, and if the dog be a very tiny one, the yolk of an egg is better than soap.

The better to protect outdoor dogs from wet or draught, it is a good plan to have the kennel movable, so that the back of it may be placed against the wind or rain. This cannot be done, but it faces always south or south and west. Be most careful that in summer the dog is not exposed to the direct rays of the sun. It is bad enough for a dog to have to lie out all night in the cold, but it is ten times worse for him to be exposed for even a couple of hours to a strong summer sun. I have known dogs die of it from exposure to it, and I have seen them digging holes in the gravel where they were chained, in a vain endeavour to find a cool spot and shelter from the sun's heat.

Where many dogs are kept, one cannot be too particular in the matter of cleanliness, and after the kennels have been washed down, they should be disinfected with carbolic acid in water—not too strong, for dogs loathe bad smells.

In feeding, always place the food in a clean basin or dish, on no account throw it on the ground, for dirt is as injurious to the health of a dog as it is to that of any other animal.

Exercise is most essential to the well being of a dog. A man who keeps his dog on chain for one month and to another, ought himself to undergo six weeks of penance by the same kind of punishment. If we would have our dogs healthy and happy, comfortable and good-tempered, we must give them their freedom for some time each day. It is better to take them for a good run quite away from home. My own dogs have a large-sized orchard as a playground, but nevertheless their delight at getting out into the limits of their run.

The liver of a dog is larger in proportion than in the human being, and is very easily put out of order. If the dog has not plenty of exercise, this organ is sure to become unclean, and the health of the dog thereby injuriously affected.

Dogs have often to travel by train with or without their masters. Their collars should always be placed in a strong basket or a substantially ventilated roomy box, the ventilating spaces being protected by iron bars, not flut, but metal, so that a parcel or box cannot deprive the dog of air. The Companies provide a 'boot' for dogs. This plan is seldom if ever taken, and it is dangerous, were it ever to be used. When dogs are sent on journeys on chain, the collar should be a leather one. A metal one slips easily over the head. Guards are, as a rule, kind to dogs. Sometimes dogs in transit are left hanging at stations, then they ought to be, and kind hearted strangers often give them a drop of water or open their bags and find a morsel or morsel of bread for them. Such people will have their reward. If a label be attached to a dog's chain when he

is going to travel, fasten it close to the collar, else he may amuse himself by eating it. I saw some hounds the other day at a station which had not a notion where they were bound for, and as they had no notion of their labels, the railway servants could not tell either, so both dogs and men led foolishly.

People sometimes put a bit of limestone in a dog's water dish, by way of keeping him pure and healthy. A pebble will do as much good, for the limestone does not dissolve. But a little sulphur now and then in the food is a capital thing, a little gunpowder is better, containing, as it does, nitre, sulphur, and charcoal.

Now, just a word or two in conclusion about puppies. Never leave more than five or six for the dam. Bring up and if they are a valuable breed or strain, and likely to all, be prepared with a foster mother, but more than six be born. For the first three weeks, the mother attends to them. After that, they ought to be taught gradually to lap warm milk, first with a little sugar. After a month, a little boiled corn flour should be added, and at this age, commence to wean gradually, by letting them have dry after dry more food and less mother's milk. Complete the weaning during the seventh week, but, as I said, gradually, for sake of both pups and dam. Let them have a large shed to run in, and let it be a foot deep in straw, and always clean and dry. In good weather, the pups ought to be as much as possible in the open air. Their mother brings them on so well as playing in the sunshine. Pups must have toys, such as large bones, old boots, &c. It is wonderful the amount of fun they get out of such toys, and the amount of good such romping does them. Gradually let the food be the best, and begin soon to give them a little flesh as well as milk. For four times a day, till the pups are three months old, then three times a day until they are eight months old, then twice. Be careful with them about teaching them—that is, from the fourth to the seventh month, during which time they shed the milk teeth and acquire the permanent ones.

Never let pups get wet, if possible, but if dirty, wash them well. While the mother is suckling, feed her well on the most nutritious diet, five or six or seven times a day.

In my next paper, I shall treat of the commoner ailments of dogs, and have a word or two to say about dog bites, which may be found useful.

## ONE FALSE, BOTH FAIR;

OR, A HARD KNOCK

CHAPTER XX.—THE MEGATHERION.

It was the noonday—which does not coincide exactly with the sun's meridian according to the accredited hour of the Royal Observatory of Greenwich—of early London life, and a great many men were lunching in the large saloons of that prosperous institution the Megatherion Companies with limited liability, and the prospectus of each of which must surely be perused by the imaginative goose-quill of some magazine poet, are eternally starting concerns destined

to founder, and writing up gawdaw speculations that bring profit to none but the audacious promoter and the official trustee. But the Megatherion paid noble dividends, and flourished like a green bay tree. It met a want, a real want. Clubs, of various sizes and varying pretensions, are so numerous now as, in the days of Johnson and Boswell—the twice-banishing days—they were scarce. But clubs are too exclusive. They only admit their own members, with the privilege of a stranger. And now, the big, admirably managed Megatherion was neutral ground, around the snowy table cloths of which, or on the softly cushioned divans which, all men became brothers, and it was not necessary to submit to the club law, or to touch the principal clique, or to run for ever in a monstrous circle.

The Megatherion did its best to reproduce some of the best features of club life. It did its best, too, perhaps not quite so eagerly, to give shape into evidence some of the chief merits of the old cock house, in which the Irish have borrowed from us, since it was in London, not Paris, that Piquet, the Favorite Game, first lived his coffee and that the Chinese drink—tea, commemorated by Mr Samuel Pepys, was first in vogue. There was a lot of gaming, and more of conversation, so you might say, in the first Megatherion than in some of those Pall Mall places where old quinquaries take possession of the big windows and doors in the evening, and where young men are expected to fly to mixed club set up by unscrupulous adventurers, who dispense with contrivances and clip and scum to set up themselves by drinking wines in October. And now, at the Megatherion all admitted that the wines were good and not dear, and the cooking nicely perfect, the rank of the best quality, the table d'hôte full, and the waiting good. There were spots in the sun, blazes in the pink marble of Paris, and the young men from the Poteries, or Laa where or Dublin, who came up to London to wait for Society journals, did grumble that at the Megatherion the prices were too few, the chops not fat enough, and so forth, but there was a fur pennyworth for the penny.

At the Megatherion, then, many men were gathered together at luncheon table, as much later on, a larger assembly would congregate at the more social dinner hour. At one of the tables was a group of visitors to London, officers from Aldershot, two of them, the others, some five young men of some little name from country districts, while the arbiters who ruled over them—though by no means the fountain of the font, in the sense of being the paymaster, was the only Londoner present, the only genuine Cockney, included in the company—was no other than Ned Tuttle, fresh from Fanny, more accomplished than ever, a port London sparrow among the diffident rustic chirpers. Mr Tuttle had, and tried to have, an extensive country connection. He did not disdain the little arts by which such a connection can be kept up, still less the benefits accruing from it. An honorary contribution to a local newspaper now and then, in the height of the season—Ned had a dist way of handling his pen, and was keen as a sleuth-hound on the scent of gossip and scandal—and a

readiness to ply the part of eicarone to notables from the manufacturing districts, brought him in much provincial renown and some pleasant invitations during the autumn. Nor did he disdain, as now, to dine or lunch expensively with younger and simpler men than he, who listened to his lantern glowing.

At a much smaller table, within a whet of the loud conversation of Mr Little and his friends, sat two gentlemen, one of whom was Arthur Talbot, while at yet another one, huddled by, a solitary customer sat at his meal, a sunburnt man this, of wiry appearance, but wearing the glowiest of lavender, the sprucest of shirt pins, the neatest of neckties, and, in fact, no other than Chinese Jack, of Jone Seymour Street, Strand, W.C. At the Megathion there is no division of classes. It is a public place of entertainment, and so, for that matter, an extremely gorgeous hostelry in Republican Paris, the *Maison d'Or*, the *Café Riche*, the *Café Américain*. Marie and Paul may come in if they like, in their honest white blouses, besmudged by some chip and mortar, and may row for the crown of rid wine and the bowls of litch, and be highly admiring among the sun-baked wakers and the explosive fittings. But, mark, the worthy Augustin stonemasons do not care to try the experiment. Just so might Mr Whisks, in cadaverous, plunge into the Megathion and order whatever he liked and could pay for, but he very sensibly confines his custom to establishments where he can feel himself at ease. Chinese Jack, at the Megathion, laboured under no hereditary or educational disadvantage. He sat still, and looked like a merchant seaman, and was as sun-browned as an Australian from the Plains, and behaved very quietly and like a gentleman, seeming to bid us to nothing, but bearing all, as if he had been the box of Dionysius.

To be a good listener as of it. If in it—not with a social bias, not to be such a listener as was the high born but mysterious Lord, when he favoured the gurgulous Mr Jonathan Oldbuck in the post-humous journey from the Forth ferry to Aberdeen. That sort of listener acts a part, a secondary one, it is true, but still a part that admits of a good deal of quiet play and neat stage business. But to keep one's ears open, as did Chinese Jack, assume the ungrateful character of an over-zealous without personal motive—this demands a great deal from a man too sensible to be imbued with a mere vulgar spirit of inquisitiveness. The listener at Mrs Budger's private hotel in Jone Seymour Street was possessed of an unvarying patience, and could endure without wincing the stream of platitudes, the facile jests, the tedious repetitions, the countess 'said he' and 'said she,' and the inexplicable references to unknown circumstances, that poured upon his auditory nerves. 'Hush! hush!' he would say to himself grimly, 'locked the clock for hours, and washed and washed, content if there were but a few shiny specks at the bottom of all that turbid clay and now sit and shirk! So it is with the patois of these folk.'

The particular fool to whose words Chinese Jack paid the most attention was little volatile Ned Tattle. On the homeward voyage of the good steamship *Ogygia*, he had had occasion

enough to take the measure of that Cockney chatterer, where Mr Little could have reported nothing as to the *swartfint* business of the *Lesseau*. 'One of these swartfint fellows, don't you know?' which bodysman nevertheless had been born within sight of the Norman towers of Castel Vaur. The little man was bragging in his usual style, and presently he mentioned a name that made Chinese Jack prick up his ears.

'That pretty Lady Leominster—the Viscountess, you know, that I saw so much of in Egypt, where poor young Leominster died,' explained Tattle, who did not like to cast his titular pearls before swine, and who had a shrewd suspicion that his youthful friend, all founded in *Tattle*, might mistake her Ladyship for a mere knight's wife, if he did not take the trouble to make them cognisant of the sacred strawberry leaves. As it was, they were all attentive.

'Poor young thing!' murmured Tattle, emptying his glass and smiling. 'I saw a good deal of her out in Egypt, where we were so intimate, and, indeed, poor Leominster consulted me more than once about his will. He had made her splendid settlements—thirteen houses, the Welsh border castle, the very finest place,' pursued the speaker critically, 'in all the west, and good pleasant covers—pleasant neighbours, and then there was her will. But he wanted to add a codicil, to make it all sure about the personality—a large sum in consols—and it was about this, having no lawyer at hand, that he asked my advice.'

The young men from the country and the subscribers of *snatching* comments eyed their London acquaintance with increased respect, as the confidence of a Viscount.

'It was all right,' went on Mr Tattle cheerfully, 'and so I was in a jiffy, but Leominster being ill and shaky, was nervous, and I was glad to set his mind at it. Poor fellow! he died there, and was brought back in his own yacht, to be buried. And the young Marchioness and her mother—a lease of centuries, I can tell you—came to Southampton with me. A nice mess they had made of it, since—'

'A nice mess?' 'Way, bring it all, I thought you said there was money in heaps,' (paraphrasing one of the Alder-hot officers, who, poor lad, was pinched for cash himself, since he had backed the wrong horse for more money than he could afford, last Derby day, and had ever since that fatal race been compelled to propitiate tyrannical sailors and a whole ungodly class of livery stables.)

'So there is money in heaps—sixty thousand a year in land, besides the funded property and foreign securities, as I happen to know,' returned the undaunted Ned, slightly exaggerating the Civil War rent roll in his desire to set the fancy picture of his own painting in a blooming golden frame. 'The question is, who is to have it? There can't be two ladies paramount, you know.'

'Why, surely,' said a stout young manufacturer, setting down his knife and fork—'why, Tattle, you don't mean to say—'

'I do mean, and the long and short of it comes to this,' interrupted the Cockney oracle in his turn, and in his glib, sure way, he proceeded to pour into the greedy ears of his auditory a garbled but tolerably coherent account of the

dispute between the masters as to precedence and identity, furnished by many pictures and touches as to 'how mad Sir Pym was when he heard of it'—how Lady Barbara, that old cat of quality, had been ridiculous in her excitement—and how the family lawyers were vainly trying to pitch up the quarrel by all the enormous pecuniary compensation, to avert the disgrace of a public trial and newspaper disclosures.

Chinese Jack had noted the effect of these speeches in all the comments—more or less to the right and left—which they provoked, on Arthur Talbot, whom he perfectly well remembered as a chieftain prince, or on Lord the Cyprus. He had seen the young man's coat of arms, and in an instant came into his eyes, and had noted the effort that he made to keep calm, in the presence of the young man in whom he felt when he came to hear a dear name in a trial on the court and careless lips of a stranger.

'Sweet upon one of them—that which, I was told' was the entering comment of the unimpaired eye. 'I have seen him, if I may tell you, talking to both, on the moonlit deck. It is not all his philosophy to prevent him from winning your dear little heart. But, in all this, I am sure, don't think the worse of him for the impulse.'

The conversation was perfectly accurate. Tall it did fall in line to put a pillow on Mr. Tittle's bed that tonight, by any means available, but it was one of those cases in which it is not every to hear him, as the Spartan boy endures the galling of the fox. No good could come from a squabble in a public place with a blatant little braggart such as his late fellow traveller. He tried to shut his ears, then, to the little Calvary chatter, and could only marvel at the man's impudence in representing himself as a friend and a confidential adviser of the Lominster party, whereas, to the best of Arthur's recollection, there had never been the most casual acquaintance between the late Marquis and the pet spaniel of the Poultry Solomon. There was no smoke, however, with it some of the fire and in honest truth, Mr. Tittle and the late Earl had spoken together twice—once when, at Kew, Lord had perfected the loan of his hall glass, and once at the First Cabinet, when he had borrowed a red bound guide book from the Marquis. Lord Lominster had been the gentlest and the simplest of men, and never snubbed an intruder, but as for confidence and counsel, there had been none on either side.

Arthur Talbot, then, sat still, and tried to overlook as little as he could of the unworldly babble of his noisy neighbours, deprecating though it seemed to him to hear her name—here—tossed in this manner to and fro from the tongues of the chattering. But Chinese Jack, his own unburnt countenance as impressive as a mask, drank in all he could, and behaved as much, or as little, as commanded itself to his powerful brain and his trained intellect. Presently he, too, almost winced, as he heard a name familiar enough to him.

'It was all—I'm sure of that—that Madame de Liloupe, a foreign Countess—you know the sort of people that go travelling about with the half-French, half-Polish women we called the

Spurrs, at Ours, and a very queer bird she was—very thick with Koubeth Pasha and all the Palace clique, and she herself about six somebody and she'd been a milliner on the Parkside in Paris, and somebody else that her husband had been a Russian Secretary of Embassy, sent to Siberia for something really. Anyhow, I am certain she was the wire puller in the whole affair. Miss Curlew's only a puppet in her hands, summed up Ned Tittle, in a final effort to revive the flagging attention of his audience.

But the young men from the country did not care much, or perhaps understood much, about foreign Countesses of dubious antecedents, and the conversation soon got into another groove, and the Lominster content and estates were no longer under discussion. Then Chinese Jack summoned the waiter, paid his bill, made his unobtrusive exit from the crowded *Nightmare*, and found himself again upon the true pavement outside.

'How to hunt her up,' he said softly, within the shadow of his bushy brow. 'A needle in a bundle of hay, of course. But a magnet can find a needle—a magnet. Let us try.'

## SHELLFISH AND ITS INDUSTRIES.

BY GEORGE FARMER.

IN TWO PARTS.—IX THE FISHERIES.

The fishing industries of Shetland consist of the deep-sea or white fishery—locally known by the name of the 'laid'—and the herring fishing. In addition to these two main branches, the Shetlanders are also largely interested, either personally or pecuniarily, in the *Lure* and *Foot* fisheries, the North and South Gairn, the *Black* and the *White* Straits, and the *Black* fishery. Doubtless, of the twenty million thousand or even hundred million persons who comprise the population of Shetland, more than two-thirds gain their livelihood in the sea. Every crofter is a fisherman; his adult sons and sons-in-law, his younger children are both boys, his wife and daughters are 'gutters' (i.e. pickers) or salters. The whole island is live by, small as it is, of nothing but fish. 'Death is the best that we can have,' is the popular saying at every auld gathering. 'May the Lord open the mouth of the grey fish, and haul his hand that the corn,' is the fervent prayer of every Shetland fisherman and crofter. If by the white fish—*lure*, *foot*, and *black*—he earns his living, the grey fish—the muth or coal fish and its young, will be sold according to weight—provide him with food for his family. As for yellow or smoked fish, they are almost entirely neglected in Shetland. Fish dried by exposure to the sun only—*blaw* (blown) or *soot* fish, as they are called, are the only cured fish which are appreciated as articles of diet by your true Shetlander. Of the various fisheries above enumerated, the 'laid' was, until very recently, by far the most important.

Long before the Shetlanders possessed anything approaching to a fishing fleet of their own, the booming waters around their coasts were annually visited by the 'hovers' of the Dutch fishing fleet. To the Dutch, indeed, the Shetlanders owe no

inconceivable amount of their present prosperity. All over the islands, these curious foreigners establish stations, which were the markets of the district—the outlet for its industries, and the source of its supplies. The town of Lerwick itself is said to have owed its origin to this circumstance. For at least in centuries, the yearly visit of the Dutch fleet to Brévié would be the one break in the monotony of the Læw-gunn's existence. A great annual fair was held in the end of June on a hill about three miles from the town, still known by the name of the 'Hilander's Knowe,' and some idea of the number of vessels which in these brave old times thronged Lerwick harbour during its continuance, may be gained from the tradition that it was possible to cross the Sound of Brévié—which is a mile and a half broad—on a bridge of boats formed by the Dutch busses anchored side by side. But for some time past, the number of the Dutch white fishing fleet has been gradually diminishing. In 1869 only about a hundred and fifty spent Midsummer Day in Lerwick harbour.

For the last twelve years, the number of fishing boats engaged in the 'hird'—which began in April and continues till about the middle of August—has averaged six hundred. During the years 1878-1874 there was a considerable decline. But in 1875 the number rose from five hundred and forty-three to six hundred and thirty-three, in 1891 it reached that of six hundred and fourteen, in 1892 it was six hundred and seventy-four. Many of these boats, however, are Scotch. It is stated that for the 'hird' of the current year, a large number of foreign boats have been already engaged, and for the first time, Scotch curries will compete with the Shetlanders in this particular branch of business. If this statement is correct, as we cannot doubt it to be, there is no question but that a considerable impetus will be given to an industry, which, although far from being neglected, has not yet been developed with anything approaching to the same degree of energy with which the herring fishery has been pursued.

Hitherto, the principal obstacle to the extension of both the one and the other of these fisheries has been the cost of the new decked boats which it has been found necessary to substitute for the old 'mains' or six oared boats which have for centuries been exclusively employed by the Shetland fishermen. These 'mains'—says the report of the Shetland Relief Committee, 'are of a build peculiar to the islands, and closely resembling the Norwegian yawls. Slender built, six and a half feet broad, and three feet deep, and with from twenty to twenty-one feet of keel, they are manned by six men, and carry a large lug sail containing about sixty yards of canvas. Although, from their small appearance, they are not used by south country fishermen, the Shetlanders, accustomed to them from infancy, manage them with consummate skill, and make marvellous voyages in them on the dangerous and boiling seas which surround them.' But the great storm of July 30th, 1881, which destroyed the whole of the North Isles fishing fleet, was the death blow of the mains. Though the Shetlanders were loth to condemn their old favourite, and even yet can scarcely be got to admit its deficiencies, that unparalleled

disaster clearly proved that safety was only to be found in boats of stronger build as well as of greater capacity. It is satisfactory, however, to think that the losses of this terrible summer's night had not been given in vain. 'The mains,' we learn from the First Annual Report of the Directors of the Shetland Fisheries, 'Widows' Relief Trust, just published, are gradually but surely becoming a thing of the past. At the principal stations—Galloway, Lethbrum, and Whalley—the boats have decreased in number 15 from one third to three fourths since last year. At Ollaberry and Haddowick, the number is the same, though a decrease is expected next year, while from Burnhope, Mid Yell, Mochar, and Hovra, come reports of a marked decline. These boats are principally manned by old men, who cannot readily adapt themselves to the new larger decked boats which are now numerous in the islands, and which are manned by young men.'

The average annual amount of white fish cured for the trade was from 1870 to 1891 inclusive was eighty-four thousand and thirty-eight hundredweight. The returns for the year 1875 were the highest, whilst those of the following year were the lowest, during that period. In 1892 the quantity amounted to sixty-eight thousand five hundred hundredweight. The price of fish has of late considerably advanced, and is still advancing. For the white fishings of the current year the prices are already advanced. The general prices given by the market are for large per hundredweight, eight shillings, and sixpence, for small shillings and sixpence, and for fine shillings and sixpence, but at the same time, there must remain a considerable margin of profit to the exporter.

Very recently, a fresh dispute has been made in the Shetland fish trade, the importance of which will be readily perceived, although only a rough approximation can be arrived at as to its present extension and rate of extension. The export of fresh fish—principally halibut, though including some cod and haddock—picked in 1890 for the English market, was estimated in the year 1890 by an enterprising firm of fish curers in Lerwick, who chartered a steamer for the purpose. In 1893, the third year of the industry, boats were seen from the coast of the Shetlands, and the export, which in 1890 did not amount to a hundred tons, had increased to four hundred and twenty.

It is, however, principally in respect of its human labour that the progress of Shetland has been so rapid and so marked.

Prior to the year 1875, the curing and export of herring could scarcely be said to exist in the islands. It was not till the fish had in frequent seasons, then, as now, the shoals of the Shetland every summer, and a certain quantity was caught by the 'curries' and dried for home consumption. Between 1870 and 1874 the annual number of barrels so cured averaged two thousand and seven. But in 1875 decked boats owned by Scotch curers for the first time made their appearance in Shetland waters. At first the Shetland boats had all their own work, but in 1877 two decked boats were chartered as belonging to the islands. By 1891 there were—in 1892—their number had increased to one hundred and eighty-three;

whilst, during the ensuing season, it is expected that the total number of boats engaged in the fishery will be between seven and eight hundred, which close upon three hundred will belong to the islands. A glance at the enclosed table will show the steady and remarkable progress made in this important industry since its commencement.

Year	Boats	Boats of Shetland	Boats of Orkney
1874	83	11	2886
1876	78	91	1828
1877	67	32	5471
1878	93	35	8494
1879	148	70	8755
1880	147	72	48743
1881	162	136	89748
1882	166	206	124000

■ It is, of course, impossible to say whether the trade will continue to maintain its present high level. If it does, the future prosperity of Shetland is assured. For the moment, its supremacy as a herring curing station in the north of Scotland is disputably indisputable.

Altogether the effects of this rapid development are beginning to show, not in Lerwick only, but all over the islands. Stations are being every where erected, curing sheds put up, fishermen's houses built, piers constructed, as we pointed out. The boat building trade during winter has been very brisk, and many new boats have been ordered from the south. In Lerwick, the price of land near the docks suitable for curing, custom has gone up at least a hundred per cent. Land at the high figure at which it is being sold or let, acquisitions are not far to seek. Eleven new stations have been erected—chiefly for south country cures—during the past winter, raising the total of the stations in the neighbourhood of the town, including the island of Bressay, to twenty three.

The principal districts at which, during the current year, the herring fleet will fish are on the west side of the islands, Walls, Scalloway, Houtness, and the islands of Papa, Barra, and Trondra, and on the east side, Lerwick, Yell, and Unst. About half of the entire fleet will be stationed at Lerwick, the other half will be divided between Yell and Unst.

During the two herring seasons—the west side commencing in June and ending in July, and the east side commencing in August and ending in October—the departure and arrival of the fishing fleet is one of the most striking and picturesque sights which Shetland has to offer to the stranger. Flocks of all nationalities are to be found in the fleet—many Irish, more Scotch, some from the Fries, and some from Yarmouth and Lowestoft, others from the Isle of Man. The Dutch herring fleet, which in 1873 consisted of one hundred and four vessels, and in 1882 of four hundred and ten, for the most part fish in Shetland waters. Occasionally disputes arise—quarrels about nets, squabbles about the fishing grounds of the various vessels and nationalities, but, as a rule, order is fairly observed. It is not, however, to be expected that, as the fishings increase, this harmony from serious disturbance will continue to prevail. Even now, the presence of a fishery cruiser to

exercise the functions of a marine police is imperatively required, and it is to be hoped that the new Scottish Fishery Board, from which so much is expected, will feel it to be their duty to provide the islanders with the protection before the commencement of the approaching fishing-season.

The increase in the herring fishing has been followed by a proportionate and natural decrease in the importance of the other industries of the islands. The amount of capital sunk and the number of Shetlanders employed in the Face and Iceland and fisheries, the Greenland seal, and the Davis Sea-whale fishings are slowly but surely decreasing. In 1882 the number of Shetland hands who shipped for the Greenland fishing was only three hundred—the lowest for many years, and not more than two hundred Shetlanders embarked on board the whalers for the same year.

It is by a reference to the official returns of the Customs and the Board of Trade that we can most readily appreciate the rapidity of the rise in the present importance of the mercantile and industrial interests of the Shetland Islands. In 1870 the value of the exports of Shetland, consisting entirely of salt herrings, dried salt cod and ling, was £25,387, in 1882 their value was £170,632—an increase of 1,455,895. The shipping returns for the same years show a similar increase. In 1870 the number of outward and inward cargoes (one hundred and eighty-six vessels) was 27,977 tons, and the outward cargo (at this time) and inward cargo were 86,393. In 1882 the outward cargoes (three hundred and thirty-six vessels) were 65,271 tons, the inward cargoes (two hundred and eighteen vessels) were 48,165 tons. Such figures require no comment.

That a great future is in store for these hitherto poor and almost unknown islands is a truth in which the Shetlanders themselves at least implicitly believe. The facts and figures stated in this and the preceding week will perhaps enable the reader to judge how far their expectations are well founded.

## BENJAMIN BLUNT, MARINER

### IN THREE CHAPTERS—CONCLUSION

PASSING Mr Blunt came back from the window and sat down near the table. 'Lily Trevor, I have a question to ask you,' he said. 'The tone seemed husky and strange even to himself. "You do not remember your mother?"

"Poor dear mamma died when I was quite an infant."

"Nor do you remember your father?"

"No, I have not the faintest recollection of my father."

"And you have never been told anything about either of them?"

"Oh, Mr Blunt, how do you know that? You tell me things that make me sad. How do you, an old fisherman, know so much about me and mine?"

"Listen, Lady Trevor. I, Benjamin Blunt, an old fisherman, as you say, know both your father and your mother."

"You knew my father and mother, Mr Blunt? You would not deceive me in this, I know you would not. And, as you say, no one ever told

me anything about them. You will tell me about them, will you not? I think about them both—oh! so often! but my uncle and aunt have never allowed me even to mention their names, and that has been the only unhappiness of my life!

'I will tell you what I know about them on one condition—that you never mention to a soul, except your husband, what I am now going to say to you.' He spoke with a simple dignity that did not fail to impress his hearer.

'I promise,' came the low reply without a moment's hesitation.

Old Riley was beaming in the genial warmth of the fire. He neither stared nor spoke, and the others seemed to have forgotten his presence.

For a few moments, Benjamin Blunt gave vent out through the window, and one might have thought he was watching the white plume I saw as they came tolling shoreward, but in truth he saw them not at all. He came back to the present with a sigh, and when he began to speak, it was in a low troubled voice, which, however, gathered strength as he went on with his narrative. 'Your grandmother, the lady whose likeness is in that locket, ran away from him to marry a strutting player. It seemed to her friends as if she had dived into herself and then, and they would have nothing more to do with her. After a time, your mother was born, and a few years later your grandfather the wife died. Then your grandmother took to keeping a children's school in a country villa, and there your mother grew up, knowing nothing of her true relations. Then your grandfather died, and your mother was thrown on the world. It was just about that time that that my friend—a man in fact, but was well to me, saw her and fell in love with her. He was a rough, plain-spoken fellow, years older than she—but not bald at heart, I think. He only knew your mother as the daughter of the village schoolmaster. Well, he loved her as much as a man can love, and she—perhaps because she had no longer a home—agreed, after a time, to be his wife.

'But she loved him as seldom, did she not, Mr Blunt?'

'She grew to love him after a while—to love him very dearly. Well, they were as happy together as all the birds in the wood and then by and by she was born, and they seemed happier still. But not for long. Your mother—died.' There was a sob in the old fisherman's voice as he spoke the last word.

Lady Janet slipped off her chair, and kneeling on one knee, took each of his rough hands in both hers and pressed it to her cheek.

'Well, he—my friend, you know—was much broken-hearted, but for the sake of the little one that was left him—for your sake—he tried to live up like a man. I—I want to see a good deal of my friend at that time, and I often used to take you out—that is, he and I used together—to the fields and lanes where the wild flowers were growing or down on the shore to gather shells for a mother, or into the little churchyard where your mother lay sleeping, and he used to say that the Janet he had lost was coming back to him in you, for you had her eyes and her hair, and just the same sunny smile, and after a

time he began to feel that there was something left worth living for.'

'Pity go on, dear Mr Blunt.'

'Well, one day a cute lawyer came down from London. Your uncle and aunt had lost all their children. You were their nearest relation, and they wanted you to go and live with them, and they would bring you up as a lady, and when they died, you would come in for all their money.'

'Yes, yes! My father and I were to go and live in London with my uncle and aunt.'

'You were to go, but not your father. He was a rough, ignorant fellow, and they wanted nothing to do with him.'

'But my father would not let me go!'

'At first he said so. But the lawyer came again and again and told him how he was standing in his little gulf light—how, away from him, she would be taught and brought up as a lady—be rich and happy. How, with him, she would grow up a poor, ignorant country girl, and so on. He must live and die. At last they persuaded him—my friend, I mean—to let his little daughter go.'

'Oh, if he had but kept her! I would rather have had his love than all the riches in the world.'

'He thought—God help him—that he was doing the best he could for his little girl. They bound him down by a solemn promise never to try to see her or interfere with her in any way, but he would not take the money they offered him—no, thank heaven! he would not take their money.'

'Poor papa! He did it for the best—he did it for my sake—but he should not have let me go.'

'For a long time after you had gone, he was like a caged man. Day after day he went to the Willow Pool with his mind made up to end his troubles under its black water. I think there was something, he could hardly tell what, that kept him back. He seemed to hear his wife's voice whispering to him from among the trees, and he put off doing it till another day.'

'Why did he not fetch me back? How happy we should have been together! But where is he now? Can you not take me to him?'

Slowly, mournfully, the old fisherman shook his head.

'Do not tell me it is too late—that—that—'

Very tenderly he laid a hand on the fair young head. 'Your—your father is dead!'

She covered her face with her hands and wept silently.

Mr Blunt's arms went out involuntarily as if to clasp her to his heart, but next moment he drew them back. 'No, no! God help me! it must not be,' he murmured.

'But you can tell me where his grave is!' and Janet presently in a broken voice. 'You will take me to it, will you not?—to his and my mother's grave!'

The fisherman rose from his chair and then sat down again. His features were working strangely. 'What shall I say to her when I put her off?' he asked himself. Then he said aloud: 'Your father died at sea!'

'Poor—poor papa! But you were with him when he died?'

'Yes—I was with him. His last words, his last thoughts, were of you. He pictured you in his mind growing up refined, educated, a lady. He pictured you married to some rich gentleman, who would love you and cherish you and make you happy. And when he thought of all this, and of how little he could have done for you had he kept you himself, he said "My sufferings are nothing. Everything has happened for the best!"'

Janet stood up. Her face was very pale, she gazed on Ben through a mist of tears. 'They are both dead,' she said, 'both father and mother lost to me for ever, but it is something to have learned their history, and though it be. And you knew them both—were the friend of both.' These hands have touched them—those eyes have seen them—you have spoken with them as you have spoken with me. And now you have saved the daughter in the boat called by the mother's name.' Her arms went round his neck, she pressed her lips to his cheek once, twice, tenderly, lovingly, as a daughter might do. 'I kiss you for the love you did for those I shall never see in this world. Thank of me—and a knock for me in your heart, as if I were a child—a daughter of your own.'

During the last few minutes, Riley had woke up to the fact that something out of the ordinary way was being enacted at his elbow. 'It may be that he was not quite so hard of hearing as people generally credited him with being, and that a portion of the dialogue between Blunt and Lady Janet had been comprehended by him. In any case, an unwonted gleam of intelligence lighted up his withered milk of a face and brightened his eyes. "Pretty dear," he murmured to himself. "Why, that must be Ben's own daughter—the little Janet he used to talk about so much twenty years ago. And she don't recollect her own father." Lord, Lord! how these young ones do grow!'

For a moment or two Ben could not speak. Then he said, 'I do think of you, and always shall, as if you were my own child. But after to-day, I shall never see you again—never again!'

'You must not say that. When my husband and I come back on Friday—'

'Ben Blunt will be sleeping quietly under the turf. But—you will send me your likeness and a lock of your hair before you leave England? I have some of your mother's hair, and—you shall have half of it.' Then he added, speaking to himself, 'Only half, the rest to be buried with me.'

Old Riley was still musing to himself. 'And to think she don't know it's her father she's talking to!' he murmured.

At this moment, Phil Gaylor entered the room carrying a letter in his hand, which he presented to Lady Janet. 'A note for your Ladyship from Sir Harry Trevor,' he said.

'A note from my husband!' she exclaimed with a little trepidation. 'Why has he not come in person?' With that she tore open the envelope, and read as follows.

MY DARLING—Lord Fortescote having heard of the wreck, has just driven over to see us. He is going up to town to-day, and is anxious that we should accompany him. There is only

just time to catch the forenoon train at Despatch. I have sent a carriage to take you to the station, where his lordship and I will meet you. Thank our preserver, Mr Blunt, for me. Tell him that I greatly regret not having seen him at the hotel this morning. I inclose a bank note for fifty pounds—all I have with me—which please give him in our joint names, to be used by him in any way he may deem best. I will write to him either from London or Southampton, and inclose a further remittance for the benefit of the brave fellows who were Mr Blunt's companions last night. We owe all of them a vast debt of gratitude. Start for the station as quickly as possible after receiving this, or we shall miss our train—Yours,  
HARRY.

The driver of a carriage at the garden gate brought Ben into the room.

Having read the note over to herself, Lady Janet now proceeded to read it aloud. 'I must go at once,' she said, with a wistful look at Ben as she laid the bank note on the table.

'The carriage is at the gate,' remarked Phil. Ruth, taking the hint, quitted the room for a moment, returning presently with Lady Janet's plaid and hat. The latter article she regarded ruefully. 'The salt water had spoiled its beauty for ever.'

'Yes, I must go,' repeated Lady Janet as she took one of Ben's hands in hers. 'But I shall not forget this morning. I shall love you, and often think of you when I am far away from dear old England. And you will not forget me, will you?'

'I forget you?' Ah—

'We shall only be away three years. I shall write to you, and either you or Ruth must answer me. And now—farewell! How my heart clings to you! When I was a little child, and you carried me in your arms, I feel that I must have loved you very much. I love you very much now. Farewell! Once more her arms were round his neck, once more her lips were pressed to his.

'I will—my darling—farewell! The words were little more than a whisper. The tears that he had kept back so manfully would be restrained no longer. He sat down on the nearest chair and the others turned their faces away, they felt that his grief was over.

Lady Janet turned to Ruth and embraced her affectionately. 'You must promise to write to me,' she said.

'Oh! your Ladyship!' exclaimed Ruth in dismay.

'And let me know before the wedding comes off. We shall not forget either you or Phil.' This was said in a whisper.

Phil stood with his hand on the latch of the door. Lady Janet turned to Riley, who had risen from his easy chair and was now standing in the middle of the room. 'Good bye, Mr Riley,' she said, holding out a hand to him.

The old man looked fixedly at her for a moment or two, then lifting a skinny finger and pointing, it at Ben, he said, 'You is not going to leave him like that, are you?'

A startled look came into Lady Janet's blue eyes. 'Leave him like that, Mr Riley? I don't understand you.'

'You're not going to leave your father like that, are you?'

'MY FATHER!'

'Your father,' growl the old man, 'as sure as you stand there.'

For a moment or two Lady Janet stood with her hand pressed to her side and a dazed look in her eyes, as if one suddenly roused from sleep. Then with a cry she flung herself on her knees by the side of Ben's chair. 'Are you—you who saved my life—my father?'

He laid a trembling hand on each of her shoulders, while a strange light came suddenly into his eyes. The secret he had kept so faithfully for twenty years had been told by another. He was absolved from his promise. His head bent forward till his lips touched the golden tresses of her hair. 'Janet!—my child!'

### SALADS.

Much attention has during late years been turned to the most economical, simple, and nutritious way of cooking food. Our cooking, has no doubt vastly improved since proper training in the art has become available, but at the same time the knowledge of the constituents of food stuffs, their value and importance, has not been so widely disseminated. In no way is this fact so demonstrable as in our restricted use of salads. A certain proportion of food daily, fresh and uncooked, is essential to health, but not only are salads excluded from our general dietary, but fresh fruits following dinner are considered an extravagance in an ordinary middle class family, except when grapes are expected. This is a mistake. Both salads and fruits are cheap articles of food, and require little or no preparation, and the fact that in eating them uncooked we have the full benefit of their mineral constituents, potash, soda, &c., which are often lost in boiling vegetables, should induce British housewives to eat them more frequently. In one of two books on Food, we find salads mentioned as 'a pleasant variety of food,' but in others, notably in the collection of lectures delivered at the South Kensington Museum by Dr. Luncheon, whilst he was Superintendent of the Animal Product and Food Collection, we see he dwells upon the urgent necessity, if health is to be kept in perfect integrity, of eating some uncooked vegetables or fruits every day.

Most people would like salads if only they had sufficient variety, but generally our ideas on salad are expressed in the old mixture of lettuce with butter, endorse with butter, or plain lettuce. Amongst other nations, the French, Russians, Germans, and Americans especially, we find those only used as a foundation for a salad, the most pleasing varieties being obtained by different modes of dressing and the admixture of several flavouring substances—the *fournitures*, as the French call it. These consist of herbs such as chervil, tarragon, sorrel, and chives. But besides these, we might with advantage use celery, radishes, tomatoes, cold potatoes, and

pickled cabbage, even dandelion and dandelion leaves. The dandelion is extensively employed as salad on the continent, but rarely in England. At the end of winter—the most difficult time to provide salads—the dandelion comes in very useful. To prepare it, the ordinary wild garden dandelion should be taken when young and its leaves tied up like a lettuce, or the plant covered over with a pot. Its leaves are thickly blanched, and it loses its bitterness. Dandelion leaves require no such attention—they are simply used in their natural condition.

Salad to be palatable requires not only a tasty dressing, but fresh, well washed vegetables. The best plan to prevent the appearance of any objectionable grubs or insects at table is to wash all the salad constituents in a basin of cold water into which a good sized lump of salt has been thrown. Then, before beginning the dressing, the salad should be torn up by the fingers, when no silver knife is handy, dried in a clean cloth, or, better still, swung in a net, so that it may not be wet enough to impair the dressing. To begin with a simple salad dressing, we may take the advice contained in the old Spanish proverb. To make a good salad, four persons are required—a counsellor for salt, a mixer for vinegar, a spender for oil, and a mediator to stir all together. Thus we may paraphrase to mean, that over a salad filling an ordinary sized bowl, we should sprinkle a salt-spoonful of salt, mix a dessert-spoonful of vinegar with three times as many of oil, pour it over the salad, and stir well with a wooden spoon and fork. Those who like a hot flavouring, should add either pepper or mustard. If pepper, it must be shaken over the salad after the salt, if mustard, it must be mixed with the vinegar before adding the oil. In Switzerland, a favourite dressing consists of two ounces of cheese pounded, a table-spoonful of vinegar, a little salt and pepper, and three table-spoonfuls of olive or salad oil. Another simple dressing is a fresh raw egg well beaten, a tea-spoonful of mixed mustard, three table-spoonfuls of oil, with vinegar added, when the mixture is quite smooth to dilute and flavour. A variation of this is to beat an egg hard, put the yolk into a basin, break it up finely with a wooden spoon, add a little French mustard or pepper, and salt, and while stirring evenly and continuously, pour in drop by drop three or four dessert-spoonfuls of oil, and at the end dilute with a dessert-spoonful of tarragon vinegar. These dressings are all palatable with fresh green salad, but a difference must be made in the case of cold boiled vegetables, which can be served in the form of a salad. It is better to serve surplus vegetables as salads than to re-heat them.

Potatoes cut into small dice shapes, carrots cut up finely, white marrow beans, lentils, cold peas, turnips, beetroots, &c., may be served all mixed together dressed with a rich mayonnaise, and will make a delicious off-hand dish. But potatoes are also pleasant in summer served cold as salad, instead of hot as an ordinary vegetable. Potato salad is also a good supper dish for winter evenings. The kidney potato is the best kind for making the salad with in summer, and in winter, the red potato should be used, as the regents or any floury potatoes crumble too much to dress well. In preparing potatoes for this purpose, it is necessary to put them into cold water in their

skins, with a good table spoonful of salt to about a dozen potatoes. They must then be allowed to boil up, and afterwards left in summer gently until quite tender. When cold, they are picked, and cut up into rounds as thin as possible. A layer of the slices is then spread over a glass dish, sprinkled with pepper, salt, finely shred sprouts, onions, and some chopped parsley, or mustard and cress, and then saturated with oil and vinegar. Each successive layer, until the dish is full, must be dressed in the same manner. This is the only salad which as much vinegar as oil is required. Generally speaking, in these salad vinegars is used in about the proportion of one to four of oil, but potatoes require a great deal more, because of the amount of starch they contain, and not less than three spoonfuls of vinegar to four of oil will ever be sufficient. Some find them best suited by mixing equal quantities. The French put garlic into their potato salads, but though wholesome, it is not a favourite flavouring substance with English speaking people.

Where a soupcon of the flavour is not objected to, a good plan is to rub a dry crust of bread with garlic or leek or onion, and place the crust at the bottom of the dish. This plan may be adopted in all salads, or the salad bowl may be rubbed round with the root, to attain the same object.

Another delicious salad is a lobster or salmon salad, one which is occasionally attempted, but rarely successfully so, by the inexperienced amateur. Tinned lobster or salmon is not very agreeable in this form, and the dish, therefore, should never be tried except when the fish is in full season. The best way to set to work to turn out a nice lobster salad is to select a good fresh lobster, cut it down the centre of the back, take out the flesh, divide each half into two, three, or four pieces, get the flesh out of the claws, and put it all to stand on a clean plate in a mixture of oil, vinegar, pepper, and salt, whilst the other preparations are being made. Then proceed in cutting off the green or outer liver of the lettuce and endive, and washing them thoroughly in cold salt water with a little mustard and cress, drying them well, cutting the best root into thinly sliced rounds or small dice, furrowing the cucumber in and out, shewing it, and leaving it in a little water, so that it may swell and look pretty, and putting two or three eggs on the fire to boil until hard. The dressing or mayonnaise is then commenced. Into a good sized round bowl, a tea spoonful of salt and half a tea spoonful of pepper are first thrown, for if they are forgotten, and added later, they make the dressing lumpy; the whites of two eggs are then drained off into a warm glass, and their yolks put into the bowl, and well stirred until smoothly mixed with the pepper and salt. A wooden spoon is the best for the purpose, and the stirring once begun, must be continued throughout in the same direction, or another cause of curdling will be produced. The best plan is always to stir with the bowl of the spoon towards one's self, and from right to left. After the yolks are well

properly mixed smooth. In very warm weather, it is sometimes difficult, even with the utmost care, to get it to thicken well, the best keeping it liquid. Where this is the case, the bowl should be placed in cold water whilst the stirring is going on, and care should be taken to keep the spoon cold. After the oil is all stirred in, vinegar or lemon juice to taste should be added. Lemon juice will lighten the colour of the mayonnaise, ordinary vinegar will make it darker, whilst tarragon vinegar will very much improve the flavour of the now completed mayonnaise. A good thick layer of salad is then taken, dipped right into the mayonnaise, and put on the dish, successive layers follow until there is enough. The lobster is next taken from its dressing, and tastefully arranged in the centre and round the sides of the dish, the finish being given by ornamenting the dish with slices of hard boiled egg, cucumber, and beetroot.

A word in conclusion as to salad bowls. A lobster mayonnaise is never dressed in the dish in which it is served, its shape, therefore, is immaterial. But it is important that a bowl in which ordinary salad is to be dressed should be round, and not oval. In France, a simple dinner service requires several sets of salad bowls. We in England are content with one set for the service of one, two, or a dozen people, and are never very particular as to the shape. Stirring or mixing cannot be properly done in oval shaped dishes of small depth, yet this is the form most frequently offered for purchase. It is time that we made up our minds to two things—first, that every housewife should have three or four round salad bowls of varying size, and second, that no salad should be offered to a guest which has not previously been well mixed with a tasteful dressing. Saving a Cos lettuce knifed lengthwise, cut for each guest to dress in his plate, on the decorative plates which have been introduced, is barbarous, and unworthy the name of salad.

## THE PROFITS OF BEE KEEPING

Where intelligence is brought to bear upon bee keeping, that pursuit may be made amply remunerative. Taking the average of the expenditure and income from ten hives over ten years, a bee keeper—a country labourer—informed the writer that during that period his outlay was sixty pounds, and his income two hundred and sixty nine pounds, or an average of nearly twenty one pounds a clear gain each year. If bee keeping gives such large profits as this, it may be asked 'Why have not capitalists turned their attention to this industry?' Simply because a monopoly is impossible. Only a few hives can be placed here and there, the flowers being widely scattered. This is why bee keeping is so suitable for labourers and others who are poor, and to whom twenty, ten, or even five pounds a year extra is an immense boon. The labourer before referred to said to the writer 'But for my bees, I do not know how I could have brought up my family.'

We have given one instance of the profits of bee keeping, and it is much less favourable than

— important that the oil should be poured in drop by drop continuously, and the stirring be properly done, or the mixture will neither thicken

many. A gentleman in East Lothian, a year or two ago, published a detailed account of the profits from one hive one season, and it amounted to seven pounds. We know of a railway official who, from twenty-five hives, sold one hundred and seven pounds worth of honey in 1878. Certainly he lived in a particularly favourable locality, and 1878 was a favourable year, but even greater returns have been recorded than this. We do not mention such instances in order to make people believe that they have only to go in for bee-keeping in order to clear large sums, but rather to show what chance people in the country have of bettering their condition. It must be kept in mind that there are many localities where, taking one year with another, an average of two pounds per hive may be realised.

Honey sells at a high price—often less than two shillings per pound retail. But, it may be asked, if country working men all took to bee-keeping, will it not prove full and the market be overdone? We don't think so. In fact, there are reasons for believing the opposite. The taste for honey and the demand for it are spreading so much so, that immense quantities of very inferior stuff are annually imported from America to supply the demand, and this honey is at a really low price. Of course it is at a much lower price than the genuine article, but it is used by a class that would think twice before giving half a crown for a pound of honey, though in reality they pay much more, for only a small proportion of what they buy as foreign honey really is honey.

'You can't adulterate eggs,' people will tell you, 'nor yet honey; if you buy it in the comb, just as the bees have left it, what is it stamped with their own peculiar trade mark.' And yet there is nothing more adulterated than much of the honey sent to us from across the Atlantic. The makers of wooden nurseries, of cheese from Italy, butter from Switzerland, and the 'best Italian hams' from Chicago direct, are fit enough for adulterating honey, even though it be sent across the Atlantic 'just as the bees left it.' And adulterated honey is a much more objectionable component than straw cheese or okomary wine. Most of it is nothing more than that glucose or artificial quinquina now so largely manufactured in the States for making quinine, and for the adulteration of sugar, honey, perfume, and everything sweet. But it is sweet, and bees will store up anything sweet. They are allowed to gather honey by day, and are liberally fed with this artificially prepared stuff by night, so that the real honey and the false are mixed up by sale. The real thing only mixes to gun enough of the odour and a little of the flavour of honey to make it sell. Other adulterations give plain cane sugar syrup, which is harmless enough, but is only worth twopenny halfpenny a pound. But even pure American honey itself is inferior, hence there never will be foreign competition in this article, as in the case of grain and meat.

In as few words as possible, we will direct attention to the best methods of bee-keeping. The great mistake beginners in bee culture make is to get the bees before they get any knowledge of their habits and wants. Fused with a desire

to participate in the advantages reaped by some one who keeps bees and manages them intelligently, and so makes money by them, a swarm is secured, and duly placed in a spot sheltered from the wind. Easily because of its cheapness, partly because of an inextinguishable feeling that it is their natural home, the time honoured, old-fashioned straw skep is chosen. Of course it is a 'swarm' that is secured, and when hived, there is nothing but bees in the hive—no comb and no stores. The bees, before leaving the old hive, gorge themselves with a supply, and thus they at once begin to utilise in this building of comb, and so it is soon exhausted. Possibly a spell of rainy weather follows, and the bees are speedily reduced to a state of starvation. This to the man who knows nothing of bee economy is a matter of no concern, for the strange notion frequently prevails that bees are self-sustaining, and so weather conditions with the majority have no weight at all. Should the weather prove favourable, the bees addi-ly forth in search of food, and as the first warm genial days come forth about the time the corn fields are golden with wild mustard—it is called skellock in Scotland, choleka in Friesland—they generally find plenty of food, and comb building begins, flying in and out rapidly. But this, in the case of the beekeeper who gets the bees before he gets his knowledge, wholly dependent on the weather, should it be broken, the work proceeds slowly, and instead of the queen beginning from ten to three thousand eggs daily, in the well do what calls are built rapidly, just one or two are built, and this only by fits and starts, for bees only breed when food is plentiful. Under such conditions, the colony, instead of rapidly gaining in number, as is absolutely necessary to success, barely holds its own—its bees are short-lived—and in reality had withered, dwindled and died. The consequence is that the majority lose heart and proceed no further. Even when they hold their own, no profit is reaped, for it is only when stocks are very strong, that honey is stored, and thus is the secret of successful bee-keeping.

The proper thing to do with a newly got swarm, even in the best of weather, is to get the bees to fill the hive as rapidly as possible with comb and young brood. This is done by feeding. But feeding requires skill, or another method will happen. When natural food is plentiful, only a little feeding should be given, and that at night, for then a succession of comb building will proceed by night and by day, and this is of immense importance. But if too much be given, the bees will build drone cells instead of worker cells, and the efforts of the colony will be wasted in rearing bees that only exhaust the stores of the busy workers. Such colonies rarely do any good. Cautious feeding must therefore be observed, but what constitutes cautious feeding wholly depends on the weather, for in wet weather, feeding at night and day must go on. When feeding is conducted skillfully, an ordinary hive will be full of comb, and young bees will be hatching out at the end of three weeks. These will speedily make the stock strong, and ready to take advantage of 'every shining hour.' Should the weather at this stage be wet, feeding must still go on, as the young bees will starve. When the weeks are used, thus in as rapid work as can be looked for; and as it can

be done in a few days where what are called 'bar-frame' hives are used, and word be keepers have mostly abandoned the straw skep, and even much better hives, such as the Skevation, for the bar frame.

Bar-frame hives are so constructed that the combs are each built in a frame—generally ten to a hive—which can be taken out and replaced at will. In this way weak hives may be strengthened by having one or two combs, each containing them in it, of a new brood and eggs, supplied from a strong hive. This is an important point in the case of the straw skep, and for want of such timely aid, many weak stocks have utterly perished or remained unprofitable. Often, too, stocks lose their queen. Ordinary bee-keepers—we are not speaking of clever dealers—in such cases lose their stock, for make a new queen be given speedily, the stock will soon perish, and this is what cannot be well done—indeed, the mischief has happened before anything amiss has been noticed—with straw skeps. In the case of the bar frames this is easily ascertained, for after blowing a little smoke among the bees, to make them docile, each frame can very easily be lifted out and examined one by one, and the state of matters ascertained. Then, if it is seen that the stock has lost its queen, a frame with newly laid eggs is taken from a hive with a queen, and given to the queenless one. The bees will then at once begin to raise a queen, for one of the curiosities of bee life is that the workers can raise either queens or workers from worker eggs, as may be necessary. Should the stock be very low, it can by the same means be strengthened by bees, or even have a laying queen supplied to it. The great advantage of them will be apparent.

It is this is not all, nor newly all. By filling the frames with 'foundation'—that is, thin sheets of wax improved with the bees' worker cells—can sugar syrup can be given as fast as the bees will take it up, no matter what the weather may be, and they will under such circumstances fill the hive full of comb in three or four days, while the queen will lay her full complement of eggs from the first. As the foundation is thicker than the bees like it, they use the extra wax for the cells instead of securing it—a slow and a costly process, for it takes a pound of honey or syrup to make an ounce of wax, and it is only needed in the bottom of the bees slowly—and as the cells are already begun, there is not the slightest danger of rapid feeding producing drone comb.

While, then, those in the straw hives are slowly and painfully getting comb ready for brood, and in which to store supplies for winter, those in the bar frame are taking advantage of every dry hour, and are filling the combs with honey.

Bees that are left pretty much to themselves seldom swarm before the mustard is in bloom, and indeed in many places it is the abundance then that causes swarming. But there is no reason for their passing the time of the mustard-harvest. If from two pence to three pence worth of sugar be given, in the form of thin syrup, weekly to each hive from the beginning of March onwards, breeding will be commenced, and carried on vigorously, and the result will be strong swarms, worth thirty shillings each, early in May. A pound is the usual price paid for an early swarm; but that is usually in June, too

late for the mustard, so that one in time for the mustard is better value at thirty shillings than one six weeks later is at a pound. In other words, three shillings spent judiciously in early spring will secure in a majority of cases two pound-worth of honey in June, for both swarm and stock have ample time to make ready for the early harvest, under the older system, neither is.

In wet weather, bees in straw skeps are perforce idle. They need not be so in bar frames, and the bee-keeper who is alive to his own interests will not allow them to be so. He will take out one or two empty combs, and in their room put frames filled with 'foundation.' Then he will feed. These skeleton combs will be speedily built up to perfect combs, when he will again repeat the process. Shortly he is possessed of many empty combs, as will fill a new hive, and when he gets a new swarm, he puts them in a hive fully furnished, and so, instead of spending three weeks of preparing his northern furnishing, as we may well say, and losing the harvest of honey, they go to work at once.

In the case of a straw hive, the combs are fixed by and by the refuse from the young grubs render the combs uncleanly, rottenness attacks them. In bar frames, they may be, and are constantly renewed, the old ones being melted down. In straw hives the honey is stored in these combs, and when these are filled, supers—that is, small hives—are put on the top of the hives, to which the bees have access. In good seasons, they generally fill these. But in times falling or a bad spring, a large amount of honey is used up, and a large number of bees taken from hives, thus rendering the combs void. In the case of bar frames, the combs from the body of the hive can be tilted out, emptied by means of an extractor, and the empty combs replaced. Under these conditions, a given number of bees in a bar frame will collect fully three pounds—often much more—for every two that those in straw skeps can. Then, at the end of the year, every particle may be taken from the bar frame, and sugar syrup given instead for a winter store.

Again, swarms from straw skeps cannot be regulated and often come off when no one is near to watch them. They are often thus lost. With bar frames, a swarm may be made with safety in a few minutes during the dinner hour, when it is seen they are ready. But we must not pursue the matter further. Only the merest outline has been sketched by us. Ten times more could have been written without exhausting the subject, but we prefer to refer our readers to the excellent publications of the British Bee-keepers' Association; especially would we recommend *Illustrations of Longways* (London: Longmans), which is crammed full of information, and only costs sixpence.

One consideration more, and we are done. How are our country working men to be induced to begin? Well, in England there are Associations, which, by lectures and shows—where hives are taken from straw hives, and combs and everything refilled into bar-frame hives, thus practically instructing the onlookers—are doing much to extend bee culture. One or two such Societies exist in Scotland, but far too few, and we hope soon to see one in every county. Here is a grand chance for the philanthropes 'helping the poor

to help themselves. Nothing takes the spirit of self-help and independence out of a man like grinding poverty. Put a man in the way of becoming the owner of two or three hives of bees, and he feels himself a man—an owner of property.

## INVENTORS AND INVENTIONS

THE policy which we have pursued for the last quarter of a century towards inventors and their inventions is inexplicable. In no other country which can lay claim to be considered civilized have they received such scanty encouragement and so much downright hostility. It has, indeed, long been the practice to regard inventions as public nuisances, rather than benefactions, and to consider their projects as injurious frauds framed to fleece the people, rather than valuable discoveries calculated to advance the commercial progress of the nation. It was doubtless this line of reasoning which led to the system of harassing inventors by creating all sorts of obstacles in the way of their procuring letters patent, and surrounding protection with a *chasse-trappe* of *L. & D.* Doubtless many inventions are frivolous, if not fraudulent. For instance, not long since the invention of a machine for making imitation coffee berries was announced, but an example such as this may be regarded as merely and necessarily incidental, and as in no way affecting the general principle involved. It is of course obvious that any system of patent law must provide against abuse as well as facilitate use. Few people, probably, are so credulous as to imagine that it is necessary to facilitate the procedure for procuring inventions, without at the same time instituting some system of inquiry into their character and the purposes for which they are intended. The disadvantages under which patentees labour in this country have had the doubly disastrous effect of depriving promising discoveries in the bud and of driving their authors to a desperate and lost. The policy of taxing inventions has been so quickly condemned as erroneous in principle, that it is only a very small proportion of inventors who really succeed, and these are few indeed in comparison with those who should be more heavily taxed than other people whose incomes are earned by their brains. There was a necessity, therefore, for the new Patent & Inventions Bill of 1863, which we are glad to notice will cheapen and facilitate the acquisition of letters patent.

The chief thing to be guarded against in introducing a new system is the affording additional facilities for the premature and obstructive registration of new processes or inventions. In the American system, for instance, excellent as it is in the main, a practice is in vogue which has the worst effects, and aptly illustrates the danger of facilitating the acquisition of patents too much. Thus, any one may deposit in the secret archives of the American Patent Office a description of an invention, which he can at a small yearly charge keep alive as long as he likes, and thus block any similar invention. This is obviously bad. It has lately been proposed to afford protection to inventors for undeveloped designs, but upon another inventor applying for protection for a similar design, to give notice of the prior

claim, and to bring the parties together, so that they might make some arrangements, or have the merits of their respective claims settled at once. This point is dealt with in the new Patent Bill, which offers more facilities for the registration of designs. Invention has indeed become so greatly developed in utility of late years, and persons experimenting are so afraid of being forestalled, that they protect the crudest ideas, with the inevitable result of turning the practical usefulness of the discovery and of increasing the difficulties of putting it so far as any use as the public are concerned, the facilities for procuring merely obstructive patents ought to be greatly restricted. The usefulness and practicability of any new process ought to be conclusively proved within a reasonable time of its being protected, or the protection declared void. This would certainly stimulate small inventors, a department in which we have of late years been so greatly retarded by foreign competitors, for if inventors are found themselves unable to protect important and undeveloped parts of large schemes, many of them would doubtless turn their attention to smaller matters, leaving the more important to those who had the means and the opportunities of properly developing them.

The death of small inventions in this country can, however, be sufficiently explained by the fact of the greater costliness of letters patent here. In America, for instance, a patent can be procured for seven pounds, while with us it costs one hundred and twenty-five pounds—a difference which is certainly significant. Again, in Germany, the total cost of a patent is seventy-one pounds ten shillings; in Austria, thirty pounds; in France, about two pounds; and in Prussia, fourteen pounds eight shillings. From these figures it is at once clear that in England the tariff for letters patent is twenty-five times higher than it is in America, and more than twice as high as it is in Germany—the lowest and the highest of the other countries for which the figures are available.

It is proposed to establish a system of examination as to the nature, novelty and practical value of patents by specially qualified examiners, in a similar way to the system which now prevails in Germany and Prussia, and this will doubtless sooner or later be done, but an initial difficulty arises from the fact that men capable of satisfactorily discharging these duties would be hard to find. An example of the results of employing incompetent examiners to test the practical value of patents is afforded by two of the most valuable English patents of modern times, the Bismarck process and the Siemens process. The former of these was refused protection in Prussia, and the latter in Germany, by the official examiners. In England there is no power of refusing a patent so long as the regulations are complied with. The Commissioner—who consists of the Lord Chancellor, the Master of the Rolls, and the two law officers—have no discretion as to the novelty or utility of any invention. So technical, too, is the description of most inventions, that the necessity for their being dealt with by a competent tribunal has frequently been urged.

The new Patent for Inventions Bill of 1863 proposes to abolish these Commissioners, and to delegate their powers to a comptroller acting

under the Board of Trade. Though far from covering all the points we have mentioned, this new act is a great improvement upon the old system. Should it become law, the first expenses will be reduced, but the total fee for the fourteen years will still amount to about one hundred and fifty-four pounds. It will also so far dispense with the services of the patent agent. Under the present law a patentee, or his agent, must call at least seven times at the patent office, under the new bill he need only call twice, or communicate by post if more convenient.

Letters patent must be regarded from two points of view— that of the public, and that of the inventor. To a certain extent these must necessarily be antagonistic, since the possession of a monopoly often for a short term of years is opposed to the public interest, except upon the supposition that its advantages could not be enjoyed under any other terms. On the other hand, however, if letters patent are regarded more in the light of a reward for research than as the grant of a monopoly, it is difficult for any one to contend that a beneficial invention is not due to them. It is, to say the least, very doubtful whether a mere money reward to any successful inventor would meet the case so satisfactorily as the patent system. This encouragement of both an honorary and pecuniary character are desirable as stimulants to the national inventiveness, goes without saying, and indeed the legislation required is such as will insure as far as may be the reward being obtained and obtained by the inventor himself, instead of by the middlemen or capitalists, who under the present costly patent system of this country are the chief people to derive any benefit from the grant of letters patent. It is now more than ten years since a Select Committee of the House of Commons advised that a comparative view should be taken respecting the law and practice of foreign countries with regard to inventions, and meanwhile we gladly note the proposed modifications in the new bill.

The Statute of Monopolies, which is the true basis of our patent system, did not inaugurate a new law, but merely enumerated the old rule of the common law, that the right to grant monopolies to inventors of new manufactures was an inherent prerogative of the Crown, and before it became law, it had been decided that a monopoly was properly granted to a man who, 'by his own charge and industry, or by his own wit or invention, doth bring any new trade into the realm.' Thus, in the 'Cloth workers of Ipswich Case,' it was conceded that the king might in such a case grant by charter that such a man only should use 'such a trade or traffique for a certain time, because at first the people of the kingdom are ignorant and have not the use of it.' Although the entire abolition of patents has been suggested, and amongst others, the plan of rewarding inventors by a money payment, as already mentioned, suggested in its stead, the universal experience of nearly all civilized countries has clearly indicated that granting a patentee the sole right to use his invention for a limited time is the best that can be devised. The only matters which are really in dispute are the amount, and the mode of and time for payment of the fees chargeable, the period for which patents should endure, and the restrictions

which should be imposed with regard to their novelty and utility. The new Patents for Inventions Bill has attempted to deal with all these points, with the beneficent object, we trust, of making the application for future letters patent a much less troublesome and costly business than heretofore.

#### CHEAP GAS LIGHT

Few people are aware that the light given by any ordinary gas burner can be greatly increased by simply turning the burner over sideways until it slopes slightly downwards. The flame is thrown out as a horizontal sheet, formed into a saucer shape by the natural curling upwards of the edges. Mr. Fletcher of Warrington has been testing the difference obtained by an average upright and a horizontal saucer-shaped flame, and finds it averages by photometer about ten per cent in favour of the latter, but owing to the fact that with this position of flame the light is thrown downwards and is perfectly free from shadow, the actual results in his own works and offices have proved that a burner consuming five cubic feet per hour, with a horizontal flame, gives a better light and is better for work than an upright flame consuming six cubic feet per hour. It is, in fact, somewhat of an approach to the principle of the Japanese regenerative burner, with the advantage of costing nothing. This is not new to experts, but it is a bit of useful information to the public, who may by this means either receive their light, or reduce their gas bills without any expense. It is something to make a little profit or effect a little economy nowadays without having first to put one's hand in one's pocket. Most people will probably still adhere to the wonderful gas globe and upright flame which make our living rooms so unpleasantly close, but there are millions of burners in offices and works which can be simply turned over to the advantage and profit of the user.

#### THE LILIES OF THE FIELD

Far various & diverse! How pure and fair  
These simple Lilies of the Field,  
How sweet an income to the air,  
Their fragrant snow-white blossoms yield!

Not Solomon in glory bright,  
In gorgeous and in gold array,  
Was such a fair and verdurous sight  
As in their modest beauty, they!

They weave not, the white robes they wear;  
They toil not, neither do they spin,  
No burdens like final man they bear,  
For—unlike him—they know not sin.

O ambles thou O emulous sweet,  
Of Christian humbly new of heart!  
May we, as pure as Heaven's first  
but low, and 'choose the better part.'

That to the 'meek in heart' alone  
Is by the Great Redeemer given,  
That brings us kneeling to His Throne,  
Thence into the Golden Gates of Heaven.

## WITH TOM TOKE, THE AUSTRALIAN BURHRANGER

I was staying at Melbourne in December 1886, after a long overland journey from South Australia, when business summoned me to visit the Omeo Gold field, situated at the extreme eastern end of the colony of Victoria, in the neighbourhood of the Australian Alps. The intervening country as far as the border of New South Wales was in the hands of squatters, and frequented in several parts by notorious burhrangers. Two routes lay open to my choice: one direct from Melbourne by land, the other by sea to Port Albert—now called Alberton—and thence through Gipps Land and across the Painted Ranges. I selected the latter. So about the end of December, I and my brown cob Tommy embarked on board the *Shandon* steamer, bound for Port Albert. My circumstances consisted of a saddle value containing a change of linen, a revolver and a heavy-headed hunting whip completing my equipment.

I passed through Gipps Land by easy stages, and reached the scene of the story of Kingsley's *Geoffrey Hamlyn*, when I was unpleasantly reminded of the dangers of the Bush. The district was in a state of excitement consequent upon the murder of a Mr Green, a well-known gold buyer, who was returning from Omeo accompanied by a gentleman and lady. They had gone only a mile or two from Omeo, when they were fired at from a clump of trees near the track. Green was struck, and fell to the ground, his wife companion was untouched, and carried out of danger by his frightened horse, but the lady was thrown from her saddle and broke her arm. While Green lay on the ground, one of the murderers rushed up and despatched the hapless victim with a tomahawk. For some reason or other, the lady was left unmolested, and finally returned to Omeo. It was therefore in no cheerful mood that I pushed my way across the dreary Painted Ranges.

■ Due time I reached Omeo without meeting with any of the murderous gang. As I rode

down its one struggling street, I saw an excited crowd gathered about a building, which turned out to be the court house. On inquiry, I was informed that three men were being examined on the charge of murdering Mr Green. 'Well,' thought I, 'this explains my lucky escape from a probably similar fate.' I soon learned that the accused were notorious characters in that neighbourhood, and were known under the names of Tike, Armstrong, and Chamberlain. Tike, or Tom Toke as he was commonly called, succeeded in proving an alibi, but the other two were committed for trial to Melbourne, where they were afterwards convicted, and hanged.

I was detained at Omeo about a week, much against my will. The place contained only about four or five hundred people, chiefly men, and it seemed to be the refuge of 'bad' characters who had found the lower country too hot to hold them. Indeed, at that time it was spoken of as a kind of Alaska, to which the 'wanted' people made tracks. During my stay, the Green murder and Tom Toke's connection with it were frequently discussed. It was the second appearance of that 'worthy' in court on the charge of murder in that week. As I was soon to come in contact with him, the story of my adventures in his company will be better understood by some account of this crime, as it was afterwards made clear by the revelations of Armstrong and Chamberlain, and the confession of Toke himself before his death.

A few weeks before my arrival at Omeo, a newcomer in the person of a digger had made his appearance on the creek. He was soon known as Ballarat Harry. He seemed to have been lucky in other fields, for he brought with him three or four boxes, lots of store clothes, quantities of jewellery, and some valuable gold nuggets. He became a great favourite with the publicans of the township, because he was no niggard in standing treat. Among the numerous friends that he made in this way were Messrs Toke and Armstrong, who became particularly attached to him. One day Toke met Armstrong, and said: 'I

can put you on a good lay. Ballarat Harry would pay for melting. What do you say if we try it? I will propose to him to join us in prospecting. He'll go like a shot, I know, and then when we have got him away, we can easily do for him, and get his plunder.

Armstrong readily consented, but somehow or other failed to be at the rendezvous.

Tolke and his victim departed together one morning with the good wishes of their acquaintances, for no secret was made of the prospecting expedition. After a few weeks' absence, Tolke returned alone to the township. In answer to inquiries as to his companion, he said 'They hadn't struck anything, and they had both got tired of prospecting, so they parted, and Harry had gone to his country again.' To his fellow conspirator Armstrong, however, he confessed he had murdered Harry in the bush, and to prevent detection, had burned the body. Tolke was suspected of foul play, and was brought up before the magistrate, but as Harry's body could not be found, the case was discharged for want of evidence.

Before I left, I dined with Mr Wills the magistrate, who told me that Tolke was a Tasmanian convict, and that he had no doubt whatever about the latter's guilt of Ballarat Harry's murder, though he was obliged to discharge him. Years afterwards, when Mr Tolke finished his career on the scaffold, he confessed to sixteen murders, and to Harry's among the number, and described the spot where that crime was committed. Some charred bones and buttons found at the place indicated, proved the convict's story.

After finishing my business at Omeo, instead of returning direct to Melbourne, I resolved to rejoin my friends at Beechworth, which place lay on the north western side of the Australian Alps in the direction of Mount Gibbo. This range I should have to cross from Omeo. I mentioned my purpose to Mr Wills, who at once threw cold water upon it. He had tried it himself unsuccessfully three or four times, he said. In winter, it was dangerous from the snow, in summer, still more so, on account of the floods in the rivers and creeks from the melted snow. Several persons, to his knowledge, had lost their lives in the attempt, either by accident or bush-rangers. Strange to say, all those facts, though confirmed by other persons, only made me more obstinate in my purpose. Seeing I was bent upon the expedition, Mr Wills then told me all he knew about the country.

'The greatest danger,' he said, 'was the crossing of the Mitta Mitta River, which flows northward into the Murray. It is sure to be swollen. After passing Mount Gibbo, you must follow this stream for a considerable distance. The only man who knows the country is that rascal Tolke, for I am convinced he has often sheltered himself in that direction. I am told that he is at present camping out somewhere in Gibbo Creek, on this side of the mountains, about twenty miles off. If you are fool enough to persist in your project, your best plan will be to take Tolke as a guide.'

'Well,' I replied, 'after all that you have told me of this fellow's character, I am surprised at your suggestion.'

'But don't you see,' he answered, 'if you make the attempt alone, the chances are ten to one that Tolke and his friends will waylay and murder you! Your movements by this time are sure to be known and your purchase of gold also.' (I had bought about two pounds weight of the precious metal.) 'Now, Tolke knows that he is under the surveillance of the police, and perhaps a letter from me will induce him to guide you across the Mitta Mitta, if you offered him a few sovereigns for his trouble.'

I decided to follow this advice. But when I bade 'good bye to the houl keepers, he shook his head and said he feared I should never reach Beechworth alive. So, mounting my horse, and armed with the letter of the magistrate, I started for Gibbo Creek. The sun had set and darkness was coming on again. When I reached the creek crossing this, I came upon a narrow strip of level scrubby ground at the base of the mountain. 'Now, thought I, 'which way shall I turn to look for friend Tolke? Right or left? I'll try up for it. Head, left, talk to the right.' Talked with him, so I started off to the right, letting my horse pick its way through the scrub. Fortunately, the darkness which had come on was passing a little before the rising moon, which enabled me to keep at the base of the mountain. After going about a couple of miles, I saw a light, and made straight for it, 'too soon' as I advanced. When I drew near, I saw a little hut or one made of brush, with a fire in front of it, and near the fire a man standing with a revolver, pointed towards me. 'This is Tom Tolke,' thought I. But my thinking was abruptly startled by the rough salute 'Who are you? Come another yard, and I'll blow your brains out!'

This reception, which was accompanied by a liberal comment of oaths, was not very pleasant or very hospitable, but my nerves were good, and I was prepared for roughing it. 'Tom, old man,' I said, 'put that thing down, it might go off.'

'Who and my name was Tom?'

'I do, old boy—I am Tolke, and I want to have a yarn with you.'

'No yarns for me.' Hook it, or you'll have a bullet in sooner than you think for, flash up.'

'I don't, until I have had a pannikin of tea. So fire away, only don't hit me.'

The moon by this time enabled us to see each other's movements clearly. I quietly dismounted, and holding up my hands, said 'Now, don't be a fool, Tom. You can see I have no shooting-iron, so put that thing down.' Then walking up to him, I said 'Now look here. If you are not satisfied, you can feel, and you will find I have got no pistol or other arms about me, so drop all this fuss.—By Jove! here's some cold tea,' and without any ceremony, I took up his dirty 'lally,' and putting it to my mouth, drank every drop of it without stopping, for I was terribly dry.

Tom was utterly taken aback. Looking at me and down, while he replaced the revolver in his belt, he said 'My cye! if you're not the coolest one I ever saw!'

\* The cry, a shout frequently adopted by travellers in the Bush.

Looking into his waist man, I saw a very dirty looking blanket. Touching this with my foot, I said 'I say, Tom, surely you have got some more blankets, because I haven't one, and if that is all you have, why, we shall have to pig it together, for I intend to have half of it.'

This seemed to draw him completely. 'Well,' he said, 'you saw a cool us.'

As a sort of finisher, I said 'Tom, give us a draw, old man, I've lost my pipe on the road.' So I took his pipe, and had a smacker, until he foraged me out a spare one of his own, which, by the by, I kept for many years.

Matters were now smooth. After hobbling my horse and removing the saddle and bridle, Tom and I sat down to a supper of damper biscuits and very bad meat.

Unbuckling, my value to get something out, I said to Tom 'What do you call that for a seat? I have two pounds weight of dust in that lot.'

He simply remarked 'So.'

I pointed to my saddle and said 'There's my revolver, Tom, you can take it, if you like, or draw the charges.'

But this he declined to do.

I then told him what I wanted, but I made a bad shot in commencing with an allusion to Mr Wills's letter. It produced a volley of oaths. 'He would neither go for Wills nor any one else, unless he liked.'

I immediately wore ship, tore up the letter, trusted to my own persuasion, and obtained his promise to go with me in the morning.

At length, after smoking and chatting, we settled down for the night, lying side by side on the ground, wrapped up in the one blanket, with our saddles for pillows, and our feet to the fire. I never slept sounder in my life. The morning broke in a dense fog, which continued for two days, and kept us at the creek. The third morning was fine and clear. After breakfast, we packed up and began the ascent of Gibbo, leading our horses. Oh, what a climb that was! and what a descent on the other side! Both men and beasts in danger of breaking their necks. After leaving the mountains, we passed through dense forest, and arrived at the banks of the Mitti Mitti the same evening, where we encamped for the night. There was a strong flood in the river, which we hoped would abate before morning, as our route lay across it. Next day, we were better able to relax our position. In our way ran a river from forty to fifty yards wide, charged to the full, and humming again as its waters rushed over rocks and through narrow channels. Its course for the most part lay through gullies and gorges, where the banks were steep and high like solid walls of masonry. Here and there on each side were narrow ledges near the water's edge, where a passage might be made. But on this occasion the prospect of crossing was not cheerful.

'We are going to have a job to get in,' said Toke, 'I have never seen the river so high. There's nothing but swimming for it.' 'I can't swim a stroke,' I said, 'but I have every confidence in my horse.'

Toke led the way into the stream. Our men were quickly out of their depth, and swam the current in fine style. Safely on the other side,

my handsome cob seemed as pleased as myself, for he rubbed his head on my shoulders in answer to my patting.

The Mitti Mitti wrods so much in its course that we were obliged to cross it five times, and on two occasions we had to kip our horses from the bank into the stream. When we approached the river for the fifth time, Toke said it would be the last, as the country would open out, and we should be able to keep on high ground and follow the course of the river. But alas! our luck now deserted us, or rather the strength of our horses deserted them. Toke again led the way, but my horse soon overtook him. Without a second warning, I saw Toke swimming in the water at my side and his head nowhere to be seen. Before I could realise the danger, I too found myself struggling in the water, and carried down stream, bobbing up and down like an empty bottle. I was perfectly conscious, so, when the current drove me forward on to a rock in mid stream, I threw my arms across it and held on. The current tore away at my legs, for I was unable to mount the stone, and I was momentarily in danger of being washed off. The minutes seemed hours, and my grip was growing weaker, when rescue came in the shape of my guide, who clutched me by the hair and towed me safely to the bank. Toke had very little to say, but pointed to the other side of the river, and then I saw our horses grazing side by side four days and nights in the bush, with nothing to feed upon but grass, had proved too much for their strength, hence their inability to carry us again across.

After resting awhile, Tom retrained the river, with the intention of bringing the horses across. Twice he attempted the passage with the same result as before. After the last effort, the two beasts had themselves down on the ground as if thoroughly beaten—an example which Tom himself followed. At length he rose and shouted to me, but so loud was the noise of the rushing river that I could not distinguish a word. I then watched him approach the horses, mount his own, and leading mine, ride off, for assistance as I afterwards learnt, waving his hand to me.

Left alone, I began to consider my position. The sun was now setting, and I was feeling rather faint and chilly. When could I reckon upon Tom's return to my side of the river? I was ill prepared to spend the night there. I had neither coat, hat, pipe, nor matches. My boots and breeches bore manifest traces of the wear and tear of my recent travels, indeed, the soles of the former were giving way altogether. A Crimean shirt over my under vest, a pocket handkerchief in my waist-belt, and a penknife in my fob, completed my equipment. 'There is nothing for it,' thought I, 'but to sleep the night out.' So I gathered some scrub stuff for a bed, and placed a stone for a pillow, and slept soundly till morning. I woke up cold and stiff and hungry. I resolved no longer to remain where I was, but to get up on the high ground, and steer a course from the river which I understood Toke intended to take. Having done this, I found an open park like country, interspersed with a thick undergrowth of thorny bushes and prickly spear-grass. I pushed on for the day under a blazing hot sun, with my handkerchief and some large leaves

as a protection for my head, and I did, I guessed, about twenty miles, some, no trees, but trees and wild birds, not a sparrow anywhere. Night came on, but so faint was I, that I did not care to collect scruple for a bed. The night's sleep gave me comparative freshness, but when I tried to move in the morning, the stiffness was excessive. My first work was to convert my boots into sandals, for I was much impeded on the previous day by the dilapidated soles. I now altered my course. I thought, if I were to get to any place alive, I must go back to the river and follow its direction. So I retraced my steps, but with slower pace, for, in addition to my weakness, I suffered much pain in my feet and legs from their scratches and prickles. Day had passed into night long before I again struck the river, when I lay down for my third night's lonely rest.

Next morning my first care was to bandage the feet with the thinnest part of my clothes, for this purpose I tore up my breeches. Come what might, I was determined to move on as long as I could crawl, and I resolved to keep by the river. Words cannot describe my hunger. How easily did I examine the thick-skinned bones of birds which I occasionally saw, in the hope of finding some flesh upon them! I did not know so much of Bush life then as I learned afterwards, or I might have found some roots or grubs to eat, as I have frequently done since. My resolution to keep to the river cost me much pain and labour. Great thorn bushes frequently barred the way. In sitting over or creeping through these, my clothes were torn into rags, and my body from head to foot was scratched and bleeding. My foot bandages came off early in the day, and I was obliged to take off my under vest and tear it into pieces to bind my feet, else I should not be able to get on at all. Many a time in the day did I sit down, feeling as if I could not go a step farther, yet, after a little rest, my courage revived, and the pluck of youth returned, for I was scarcely twenty-five years old. 'Oh, this won't do,' I said to myself. 'Never may die, here goes for another try at it,' and then up I would get and wamble on once more. Perhaps what tired me as much as anything was the mocking of the parrots and cockatoos, of which there were thousands. Sometimes I thought I heard a 'coo-coo,' which drew from me a faint effort to coo myself, but my disappointment was most bitter when I found that the replies were the mocking cries of birds. In the afternoon, my feet were perfectly bare, and I had nothing wherewith to cover them. The prickly creepers got between my toes, and my progress was literally snail-like in pace. When I sat down to rest for the fourth night, I felt light-headed and altogether queer.

Soon after daylight next morning, as I lay on the ground, I distinctly heard a coo-coo, a second, and a third, but for some time I seemed too dazed and stupid to take any notice, or imagined the mocking birds were busy again. At length a louder coo-coo roused me from stupor. I stood up and cooed faintly in return. Then came a shout, 'Keep on talking, that I may tell where you are.'

In a few moments afterwards, Tom Toke was standing at my side. He immediately gave me some damper, which I tried to eat, but couldn't

He then lit his pipe and handed it to me. I took a few pulls at it, and felt a wonderful change. I made another attempt at the damper, and contrived to swallow a few mouthfuls. A draught of water, another smoke, and some more damper, and then I felt I was myself again.

Take, in spite of the gravity of the situation, could not help laughing at me, for I was a wretched object. Excepting the rag of the Chinaman shirt, which only partially covered me, and a handkerchief on my head, I was nearly destitute of clothing. Indeed, I could not refrain from jolting in the length of my miserable appearance. We told each other of our adventures, amusingly. He said that he had only ridden a short distance when he was knocked up, and was compelled to camp for the night. Next morning, the two horses were missing, and was not recovered until the afternoon. After that he lost his bearings, but at sunset on the following day he reached an out-station but occupied by some stock riders, where he told his tale and passed the night. He asked the man to join him in the search for me, as he was sure that I would turn up, and would certainly pay them for their trouble. They answered, that as there was little chance of finding me alive, and as they had some matters to do, a day or two would make no difference to me, and then they would help in the search. But I was would not delay, and started off alone, and so found me.

We now set off in the direction of the stockmen's hut. Tom took off his boots and put them on my feet, but I suffered so much pain that I could scarcely move. Our progress was so slow, that Tom replaced his boots, and carried me on his back. In this way we proceeded for a distance of six or eight miles, of course resting now and again. In the afternoon we arrived at the place where Tom had crossed the river in a bark canoe, and soon afterwards reached the hut, much to the surprise of the stockmen, and to the evident satisfaction of my old cob, that whinnied and neighed at the sight of me. I found my valise and contents quite safe, and was speedily supplied with a pile of clothing. I had much difficulty in persuading my faithful guide and saviour to accept anything, in the way of payment.

'I don't want money,' he said, 'I have enough plated to last my time, and if not, I can always get more.'

'Well,' I answered, 'take a little to buy some things to keep me in remembrance—a pipe or anything of that sort. In this way I induced him to take five pounds.

Before starting, alone for Sawy Creek, I said to Toke, 'Toke, do you know I know all about you when I met you first?'

'To be sure,' he answered. 'You was told at Omeo, if you didn't know before, and you was a pinked-up on coo-coo to me as you did.'

'Now, Tom, you will come to grief some day, and it will be a short shift for you. To me you have acted as a brave and straightforward fellow. I am not rich, but as long as I have anything and you are in want, I will divide with you. There's my address in Melbourne. Whenever you are there, come and see me. Good bye, old boy.' And so we parted.

Within the next two years, Toke called twice at my place of business in Melbourne during my

absence, and each time left some rare birds' skins for me. Soon afterwards, I settled down in New Zealand. Tokes' later history was made known to me by the newspapers. He received long imprisonments for piracy and horse stealing, and finally fell into the hangmen's hands for murder. Before his execution he confessed to several murders, and so cleared up many Australian mysteries.

## ONE FALSE, BOTH FAIR,

OR, A HARD KNOT

### CHAPTER XXI—THE GENERAL INQUIRY OFFICE

'Ma Dronovich within!—No—Then, thank you, I'd like to have a word with Mr Melville. Here's my card—name of Rollington—Captain Rollington, from abroad. No new name to him, and better known still to your principal, and as, young man, you need not trouble yourself to announce any of those brassy-faced fellows with which you are preparing to starve me off. Come, come, my lad, I may not be a swell customer, but I'm a paying one, rely on it, and it's not wise if you, or likely to please your governor, to try to shut the door, specially in this suburban part of mine. I'm an old hand, and should be free of the place.'

'I beg your pardon, I'm sure, sir. Won't you step up? I'll speak to Mr Melville directly the duly client who is with him now, comes down,' returned the flurried young clerk, with abrupt civility, as he got his hat pretty fast and gorgeous necktie and rushing with him out of the way, to let the newly arrived customer pass by.

This General Inquiry Office—the General Inquiry Office, as it shew itself dwelt still in the frequent and pompously worded advertisements that kept the wall like to the fat of its existence—was very well housed indeed, occupying handsome premises in a leading City street. Its promoters—for it was a Company, of Limited Liability, of course, but believed to be of unlimited resources as to cash and brains, that had founded it—had done rightly in picking their tent within the dominions of the Lord Mayor. City men believe in the City, so, for that matter, do the others who have nothing practically to do with this charmed Tom Tiddler's ground where gold and silver are to be picked up. And the company had done wisely in buying up ex-inspector Dronovich, a detective who had been in the pay of two or three successive governments, so rumour said, and was supposed to know as much about Nihilists as he did about the fingers of Russian roulette not to and the motions of stolen diamonds. Second in command at the office was Jules Melville, of New Jersey, U.S., and who had once been Assistant superintendent of the Chicago police, and at another time instrumental in breaking up the notorious Molly Maguire League. These were the high officials of the place. But under them were subordinates, British and foreign, who did the bulk of the work, of which, unfortunately, there was only too constant a supply. It is so in a rich country and in a complicated society, and indeed the spy is now as recommended an institution, and drives as hard a trade in London, Paris, Boston, or New

York, as did once the bravo in medieval Venice or Naples. So many people there are with money to spend and unethereal objects to attain, and so many more who are tormented by anxious doubts and fears, that the private inquirer has usually no lack in plenty on his books.

In all London there was not a human being of this sort in which more of golden honey was made than at the General Inquiry Office, of which Paul Peter Dronovich was the ornamental head. It had been well advertised, and was well lodged, but that was not all. It had really done good work, and the sensational newspaper reports of certain attractive trials had done it more good than anything else. So that people with a spite against somebody, and jealous Othellos with the Divorce Court as their goal, and the very large class of legacy hunters who brood through life over the grievance of being excluded from Uncle Runcle's will, and are sure that there exists a later and wiser will, most filiously kept back by hateful Cousin George or odious Aunt Jane, and the miscellaneous set of men who had family or business reasons for desiring to find out some thing which they shrink from mentioning at Scotland Yard, came to the office, and helped to swell the dividends of its proprietors.

The lady client being disposed of and dismissed, Captain Rollington's card was duly taken into the precincts where the second in command, the American gentleman, transacted business. 'If you'll walk in, Captain, Mr Melville will see you at once, and the clerk with grave respect, and the applicant was ushered into a handsomely furnished room, the only occupant of which was a spare active man, with a quantity of black hair, neatly long, and tossed hither and thither with apparent carelessness, as the lack of a part might be, but still so as to mark the most of his high narrow forehead—a man with shifty black eyes, restless lips, and almost transparent nostrils—a man with a black skin, wiry, redundant jaw-line, and the air of being a bundle of nerves, without any flesh or muscle to speak of. Such was Mr Melville, and his voice was very peremptory as he said, 'That will do, Gubbins. Read out the notes I gave you, each by a messenger, and let no one disturb me while this gentleman is here. Then, as the door closed, the American manner suddenly changed, and he said, almost cordially, 'Well, Jack—hardly thought to see you here again, mate.' And he held out his hand in Anglo-Baxon style. The visitor gripped it willingly enough.

'You thought, didn't I dreamy,' he replied, in a tone so peculiar that it was impossible even to a practised ear to detect whether it was one of utter mockery or harmless jest, 'that the rolling stone that gathers no moss had rolled off for good and all into limbo. No, not quite yet, though I have shaved it very closely. I can tell you, since last we two met. Been as near saving the number of my nose, twice, anyhow, as ever since first I set out on the grand tour that, with a vagabond like me, lasts for ever.'

'Wouldn't be Chinese Jack, else,' answered smiling Mr Melville, smiling, that is to say as to his lips, but unsmiling with regard to those shifty eyes of his. 'You were thought as sure to die in your boots—to go up the flame, as

the saying was—as many of our boys at Golden Gulch, but somehow,' he added, with somewhat of genuine admiration in his tone and look, 'you seemed to bear a charmed life. Six shootins and bowies did disagree with a good many of our mining acquaintance, they did, and ten red whisks, Regulators, Red Indians, and Road agents, levied toll on the rest, but you seemed to slip out of a scrape as an eel slides through the fingers.'

'I suppose,' returned the other, half carelessly, 'there was a sweet little cherub, as the sailors song says, to keep watch over the life of poor Jack.—Now to business. You are doing pretty well here, eh?'

'Coming money,' responded the American, rubbing his bony hands together with a chuckle as he spoke. 'It's a good trade and a good time.—Well, Jack, on what looking are we to deal? Are you to be the paymaster, or are we? If it is employment that you seek.'—

'But I don't,' interrupted the visitor.—'not at present, that is.'

'So I guessed,' dryly retorted the private inquirer, glancing at the gleamy loth of his old friend's new coat. 'Will, then, Jack, or Captain Bollington, what can we do for you? I was Cook, by the by, that you hailed as, wasn't it? at Golden Gulch, as a short and easy name, perhaps, suitable to the short memories and rough tempers of Californian diggers. But I remember the longer patronymic well enough in after years, when we were both —'

'Drummers to a Philadelphia dry goods store, and later on, bunnies at a Baltimore gambling house,' chimed in Chinese Jack, seeing that the other hesitated to conclude his sentence. 'Yes, we have followed as many changes as most men, even in the States, in our time, I calculate. You didn't notice me, Silas, when I made one of your congregation in that chapel you had at Great Old Springs, and I am bound to say you preached us a capital sermon. And when you drove the mail from Troy to Silver City, Nevada, and —'

'Hush!' broke in the American, looking anxiously around him, as if he were afraid that the revelations of his indiscreet visitor might reach other ears than his. 'We had better, like sensible men, let bygones be bygones, and stick to the present. You, too, old chum, have been other guinea things than you have encountered here, and I, too, might descend on what I have heard concerning you, ■ man ■ many names! But a truce to this word fencing. Dog does not eat dog, so the proverb says, and I have heard my Scottish granduncle declare, among our New Jersey melon beds, that hawks would not peck out other hawks' eyes. If you wanted work, partner, as we were once, at Spanish, not Golden Gulch.'—

'Ay, where I drew you up, hand over hand, by the lasso, after the Mexican roadmen had robbed you, and left you to die of thirst and hunger at the bottom of the hole. Yes, and where Red Eagle, the Apache chief, had his knee well planted on your chest—■ lit; ■ along knee it was—and the scalping knife creaking already about that helpless head of yours. You were good griz, I own, and the blood was trickling down from the two knife-wounds beneath the bear claw

collar that the Red bagger was so proud of—won as it was from four grizzlies killed in hard fight. I spelt his sin, didn't I? though it cost me a tumble, and sharp play with the knife and tomahawk. He was a man, Red Eagle was. Do you remember, Silas, that it was not until we two were breathless, torn, and bloody, with the wrestle and the rolling, that it never seemed to end, that my wrist proved the strongest? But it was a fight to remember. And the Apache behaved like a gentleman, as he was indeed, once I'd mastered his tomahawk, in waiting for me to beam him in the regular way. Yes, it was a pretty fight, and I don't suspect you were ever nearer to having no hair on your head, my friend.—Well, old chum, I don't expect gratitude. That quality is as dead as trust is, according to bar-keepers and suspicious landlords. But we may be good friends in a workday sense, may we not? I have come here, because yours is a smart shop.—I beg pardon—a smart store, for smart intelligence, and because I want something, and know something of yourself and Brownish. You should work cheap for an oil in the life me.'

'Something due, surely, for that little mum ■ Spanish Gulch, put in the smiling private inquirer with the unsmiling eyes.

'Nothing so cold as a back scent, and nothing so thankful, as I learned, out with the hounds, as soon as I was big enough to stick to the saddle of my pony,' rejoined Chinese Jack. 'No, no, all I want to ask was a dollar's worth for my dollar. You were glad of me, that time, when I came back from the Diamond fields ■ the Cape—Cape of Bad Hope it was to me—with those yellow puddles, bought by such work as never was done in purchasing dirt at Detroit's Fin, and found the spunkers' limited rubbish, all flimsy and split, and scorned by every jewel merchant in Hamburg or Holland—you were glad, then, to peck me off to River.'

'And I'd be glad, now, if you were in such a position, to send you foreign. We want a wackler in Paris, we want a better chip for a roving tour in Italy. As it is, I gather that you want us, not we you. Well, Jack, once again, what would you have of us?' And this time Mr Silas Melville spoke rather impatiently. He was used to take the first place, not the second, in the many conversations that he daily held, and the cool, tacit assumption of superior strength and daring, possibly of superior station, which had always annoyed him in his former intercourse with Chinese Jack, even when the two men wore red flannel shirts and suits of homespun, and plied the pick, and washed the gold dust beneath the burning sun ■ California, vexed his irritable nerves.

'It's a fifty pound job I want,' said the client slowly, 'or, as your sort of business is expensive, we'll say a seventy pound job—not more, and I want, mind, work for my good gold and silver. You'd get, of course, five times as much from silly swells, but I can't afford it. There's a fine, a woman—a lady—lately come ■ London, respecting whom I want information.'

'Name!' said the American, getting down a slim retractor from a shelf, undipping it, and dipping his slender pen in the great black Sea of ink contained in the huge silver inkstand before him.

'Louise de Laloue' is her name—Countess, she is generally called—sometimes merely Madame,' was the answer.

'Nationality?' asked Mr Melville, when he had completed his first careful entry in the album book.

'Ah! there you puzzle me,' affably returned the customer. 'I never could make out, quite, and yet I know her pretty well. It is hard sometimes to know where people do hail from. Don't you remember, Silas, that when you came to Baltimore, people were calling me Hans the Dutchman, and believed me to be as thorough a German as the Iron Prince himself—French, you can write down, with a dash of Russian. You'll easily find her—I could find her myself—by asking questions of the porters and servants at the foreign embassies. The Russian ambassador is a sure card. It went in Leicester Square, you is to look for her. Likely as not, she's at *Murphy's Hotel*, or the *Alexandra*. What I want is, just to know where she is, though that is necessary too, than to know what she does.'

'You mean,' asked the American, passing pen in hand, after he had made some rapid notes in microscopic writing, 'that you want a sharp watch to be kept upon her proceedings, is that it?'

'Yes, and for old partnerships sake, let the watch be as real a one as that we used to keep, when forty winks at day dawn might have cost us both our scalps. One request more. Let the man you set upon that woman be an Englishman, not a foreigner. So shy a bird would take the alarm ten times quicker if you put a greasy Pole or an almond-eyed Italian to hang about her door and dig her through the streets, than if you stalked her at lifelike countenance or a pale Londoner. Not a Jew, though sharp as Isaac's eyes are, those eagle features of his attract too much notice. I can rely on you, Silas, to pick me out a smart spy with an honest look, if you can manage it.'

'You shall have—let me see, yes, the man I mean will be off duty to-morrow—a fellow whose dull accusing eyes let nothing pass unnoticed, and yet who can loiter at street corners, and chew his straw and kick his heels, the most vicious loafer there,' promised Mr Melville. 'Who shall I write you news of the results? Or will you call?'

'I will call, but not too often. Time, I know, is money. My address is—Budge's Hotel, Jane Seymour Street,' replied the Captain. 'Ta ta, Silas.'

'Good bye, Jack,' responded the American, and so they parted.

(To be continued.)

## THE IRISH FISHERIES.

THE history of the Irish fisheries for the last thirty-six years is one long record of continuous, though fluctuating depression. The fishermen, especially those on the western coast, have never really recovered from the effects of the famine year, and for the most part still struggle against almost overwhelming obstacles to maintain themselves and their families. By far the larger proportion of the fishing population of Ireland are indeed chiefly occupied in other avocations. The collection of seaweed, or the tilling of land, either as occupiers of small holdings or as day labourers,

occupies most of them during nine months of the year, for, though a brave and hardy race, it is impossible for them to venture out in their crazy craft in 'dirty' weather. If it were possible to place them upon a more equal footing with their English fellows, so that they might prosecute their legitimate calling vigorously, and not spend arduous days in cultivating the sterile and unproductive soil, which is all that can be said for most of the Irish seaboard, they could easily be weaned from the evil influences of uncongenial and unprofitable agricultural pursuits, and removed from a state of extreme penury to one of comparative comfort.

As it is, however, the poor Irish fisherman of Kerry, Clare, or Mayo may well be discontented. While he digs his unproductive land, he can see in the offing well appointed English and French trawlers reaping that rich harvest which, but for his poverty, he could share from the Returns for the year 1881, the latest available, we find, for instance, that at Howth, the headquarters of the herring fishery on the east coast, the boats employed were seventy-two English, two hundred and three Scotch, and a hundred and ten Irish. Again, the mackerel fishery off the western and south-western coasts is almost entirely followed by fishermen from England, Scotland, and France. Thus, thirty-six boats fished from Blackrock harbour in 1881, but of these, only two were Irish, the remainder being English, while the average value of the take per boat exceeded three hundred pounds for one month's fishing.

Ireland is divided into thirty-two districts for the purposes of fishery inspection, and throughout the whole of these, only four thousand three hundred and sixty-one men and four hundred and eighty-nine boys are reported as being solely engaged in fishing, while sixteen thousand five hundred and ninety-four men and three hundred and eighty boys were only so employed partially. These figures are not, of course, perfectly reliable, for they include those fishermen of other countries who worked from Irish ports. They are, however, sufficient to prove that there is little doubt that three-fourths of the Irish fishermen pursue their ostensible calling only desultorily and intermittently, in consequence, chiefly, of their defective boats and gear, and of the difficulties of putting out to sea from unprotected harbours, where no conveniences for launching or landing boats exist.

The development of the Irish fisheries is a question of the greatest moment at the present juncture. Besides those who are returned as belonging to the class of fisherman, at least as many more of the maritime population of the country would doubtless gladly avail themselves of any facilities for pursuing a remunerative calling. Tilers in the wet are, all the world over, self-reliant and independent, and the moral influences which would be exercised by the entrance of such a class on the coasts of Ireland would very possibly be more widely felt than might first sight be supposed. Nor is the required aid of such a character or extent that schemes for supplying it need be characterised as chimerical. The existing Irish Reproductive Loan Fund furnishes an excellent practical example of the means by which the regeneration of Irish fish-

men might be accomplished, and might itself form the nucleus of a more extensive machinery. This fund is the result of the large sum subscribed for the relief of distress in Ireland in 1832, and was by a subsequent statute vested in the Treasury, to be applied to charitable purposes and objects of public utility, not otherwise provided for by public rate or assessment, in the counties to which it is appropriated, in the proportion appropriated to each county. In 1874 the balance of the fund was by another Act of Parliament transferred to the Commissioners of Public Works in Ireland to use by way of loans for objects similarly restricted, and it was then provided that in the case of the maritime counties of Clare, Cork, Galway, Kerry, Limerick, Mayo, and Sligo, these objects should include the fishing industry.

Additional and various restrictions were, however, imposed upon the Commissioners. Thus, only the sum appropriated to a particular county is available for that county, and of this, only one-fourth can be used for fishery purposes in one year, while the amount of out-standing loans must at no time exceed one-half of the sum standing to the credit of the county. The obvious effect of these restrictions is that in some counties the money has for a long period been lying idle, while in others it is wholly insufficient to meet the demand. Thus, the sums which stood to the credit of Roscommon and Tipperary in 1881 were respectively six thousand one hundred pounds, and four thousand two hundred pounds, and there have been unemployed and unproductive for the last seven years, while, on the other hand, in County Mayo, only six hundred and ninety pounds was available, and two thousand two hundred and fifty-three pounds was applied for on loan. Again, in order to make the matter quite clear, we may give the following figures from the Report, which plainly indicate the crisis of the present arrangements. Thus, in Sligo, in 1881, four hundred and eighteen pounds was available, and seven hundred and twenty-seven pounds was applied for; in Galway, the corresponding figures were eleven hundred and thirty-seven pounds, and two thousand three hundred and thirty-seven pounds; and in Clare, three hundred and fifty-eight pounds, and thirteen hundred and twenty-six pounds, while in Limerick and Leitrim the money in hand was largely in excess of the demand. Again, the County Donegal, which has an extensive seaboard and an industrious but very poor class of fishermen, is excluded from the fund—a fact to which we would earnestly invite attention just now, since the reports which reach us from that part of Ireland plainly indicate that it is in a distressed state. Perhaps the totals for the seven years ending 1881 are more conclusive still, thus, we are told that in this period, the sum of one hundred and eleven thousand one hundred and seventy-eight pounds was applied for, and fifty-eight thousand six hundred and ninety-six pounds was available to meet this demand, but that about one hundred and forty-six thousand pounds was lying idle and unproductive. Further comment on these figures is needless.

It is doubtful whether the diminished take of

nearly all kinds of fish, of which reports reach us from time to time, points to anything more than the peculiar difficulties under which Irish fishermen labour. Off all the coasts of Ireland there is an abundant supply of fish, a fact which is proved with sufficient exactitude for our present purposes by the continued presence of the fishing boats of other countries in those waters. Off the west coast especially, where the Irish fishermen are so notoriously poor and wretchedly equipped, boats properly fitted up make prodigious captures. Thus, a large number of French vessels attend the mackerel fishery off the Irish coast, and no fewer than one hundred and eight French boats fitted with steam gear were so employed in 1881. It is, of course, quite impossible to ascertain whether these vessels were very successful, but the inference is obviously in the affirmative. The fact that there has been a continued decrease in the take of herrings for the past four years is certainly ominous, but we are very reluctant to accept the conclusion that 'this valuable fish is about to quit the Irish coast,' although the contention is supported by similarly decreasing takes off some of the Scotch and English coasts. Attention is directed by the inspectors to the unaccountable prejudice which Irish fishermen entertain against pilchards, which kind of fish was regularly appeared in large shoals off the southern coasts of Ireland. If this could be overcome, a lucrative branch of the fishing industry might be created on the coasts of Wexford and Cork, for at Baltimore, in the latter county in 1881, 'thirty-five casks of pilchards were cured in the Cornish fashion, and sold at Glenties at three pounds ten shillings per cask.'

The Irish oyster fisheries have long shared the general depression, although this can be explained by the rough weather which prevailed during a great part of the last two seasons. Very considerable quantities of French oysters have, too, lately been imported from Arras, Arcachon, and other places, and have been laid down in the beds off Arklow, County Down, and elsewhere, and have in general done very well. A bylaw has also been passed, and is now in force, which prohibits the destruction or removal from the natural oyster-beds between Wexford Head and Haven Point, County Wexford, of small unmarketable oysters. The minimum diameter of oysters which can be lawfully taken from these beds is, too, now fixed at two inches. It may certainly be confidently hoped that these measures will soon have an appreciable effect upon the productivity of the Irish oyster fisheries.

We have already indicated the great promise of the mackerel fishery off the western coasts of Ireland. But two other points must not themselves for consideration in connection with this branch of the Irish fisheries. The most important of these is undoubtedly the urgent necessity which exists for providing increased facilities for the transit of fish, and better accommodation for fishing boats. As we have already stated, many of the fishermen are at present unable to put out to sea, often for weeks together. The construction of a breakwater and landing ship at Kimerwick harbour, for instance, certainly seems to be much needed, although it would, of course, be a work of considerable magnitude, and would involve an expenditure of about fifty thousand pounds.

Since, however, the matter is one of national importance, it is well deserving of the consideration of the government. Some such projects must indeed be set on foot if the sea fisheries on the south western coast of Ireland are to be developed. As an example of their productiveness, we may mention that besides mackerel, many kinds of valuable fish are there to be had in abundance, such as cod, ling, turbot, sole, haddock, pilchards, and herring, in the different seasons. Regular communication with Foynes and Tralee, the two railway termini from which the greater bulk of the produce of these fisheries comes, is urgently required. At present, it takes nine hours to convey the fish to Foynes by steamer, whereas if they could be landed at Fenit, for instance, which would occupy about three and a half hours, they could at once be placed on a line of railway communicating practically with all parts of Ireland.

Besides these matters, better protection of these rich fishing grounds from foreigners is certainly needed. A Convention which is still in force between England and France provides that the fishing boats of one country shall not approach nearer to any part of the coast of the other country than three miles, except when carried within this limit by contrary winds, strong tides, or any other cause independent of the will of master and crew, or when obliged to beat up in order to reach their fishing ground. As a matter of fact, however, these regulations are openly disregarded. British vessels use our harbours and roadsteads in much the same way as our own vessels. They also interfere with our boats in their mode of shooting their nets, and not only fish within the prescribed limits, but actually in the bays along the coast. The disabilities of police officers regularly attending the mackerel fishery off the north of the Shannon is, in itself, abundantly manifest.

Evidence of the unsatisfactory working of the reproductive law is given in Ireland, so far as agriculture is concerned, has very recently been made public, and it is, of course, no part of our present purpose to discuss this topic, but it is interesting to contrast the admitted results of the same system so far as it has been applied to the fisheries. The practical working effects of the system of granting loans to fishermen are not a little remarkable. For instance, loans in which loans as small as six, ten, twelve, and twenty pounds, have resulted in a few months fishing twenty five, thirty, forty, and up to eighty pounds, have been officially reported, with the significant additional fact, that but for these loans, many of the parties could not have fished, and they and their families would, in most cases, have been obliged to go into the workhouse. In another specially reported case, a crew made up of one hundred pounds a year for two years by borrowing fifteen pounds, and in a third case an all outfit, which cost, with fitting out complete, not more than twenty pounds, realised over eighty pounds during a single season.

These facts and figures are peculiarly pregnant. They go far to prove that the development of the Irish fisheries is by no means so hopeless a task as it is the fashion to assume. We have said enough to indicate the scope which exists for help in this direction. The social, material, and political

difficulties compel a near approach to dynamo-machines.

There seems to be a common notion abroad that these dynamo machines are destined at no very distant date to supersede the steam engine for the thousand and one uses to which steam is at present applied. This in point of fact cannot be, for a dynamo cannot be employed unless we have some force by which to drive it. As it is, we burn coal to make steam, use that steam to drive a dynamo, and then apply the electrical result to purposes to which the steam is directly applicable. It would thus be absurd to look to steam for the source of energy, for it could be employed direct and far more economically by means of an ordinary engine. At the Portrush Railway, which is to be worked by an electric motor, a powerful waterfall is available, and the scheme will on that account most likely prove successful—that is, profitable. In the canton Val, Switzerland, measures are being taken to install electric illumination in place of very explosive gas, the force being furnished through the medium of turbine wheels of five thousand horse power, driven by the river Orbe. It is possible that many other places will profit by these examples, when it is known that electricity is capable of turning to such useful account those physical features which up to this time have been valued only for their beauty.

The telephone has lately been successfully used between New York and Chicago, a distance of one thousand miles. This is the longest telephone circuit on record, exceeding by three hundred miles the one previously established between New York and Cleveland. This extended length of circuit has been rendered possible by a new form of conducting cable, consisting of a steel wire core copper plated. This conductor offers far less resistance than the ordinary iron wire in common use for telephonic purposes.

Dr H. C. Cooke's 'Notes on a March to the Hills of Bhokochin in North western India, with Remarks on the Simoon and Dust storms,' which he recently brought before the Meteorological Society, present many points of novelty and interest. Although the heat of summer is greater than that experienced in Britain, the weather is far less variable, and the climate generally is delightful, comparing favourably with that of the plains. The atmosphere is clear, and the winds dry and bracing, while the fruits and crops generally ripen early in consequence of the constancy of fair weather. With regard to dust storms, Dr Cook attributes them to masses of atmospheric electricity. The simoon, which generally occurs in July and August, is very sudden in its appearance, and occurs at night as well as during the day. He compares the hot wind to the blast of a furnace, accompanied by a sulphurous odour, and believes it to consist mainly of a condensed form of ozone.

In Professor Huxley's paper on the Physical History of the Dead Sea, brought before the Royal Dublin Society, we find much interesting matter. In 1836 it was determined by barometer observation that the surface of the Dead Sea lies no less than thirteen hundred feet below the level of the Mediterranean. During the Pluvial (rain) period, which preceded the Glacial (ice), this sea or lake reached its maximum elevation.

With increasing dryness in the climate, the water gradually decreased, and during its contraction and lowering, those terraces along its borders, marking former surface levels, which are so familiar to travellers, were formed. These terraces range up to eight hundred feet above the present level of the water. As the water gradually decreased in volume it became first brackish, and then salt, as many lakes will if they have no outlet. The surface water now contains twenty-four per cent of saline ingredients, and deeper down, the maximum of salt impregnation occurs, or in other words the salinity amounts to saturation. The Mediterranean holds in solution but one-fourth of that quantity of salt.

Just one hundred years ago, the Brothers Montgolfier, whilst watching the smoke arising from the chimney of their father's paper mill at Annonay, conceived the idea of the hot air balloon, a contrivance which caused more excitement and enthusiasm than perhaps any machine previously introduced. The enthusiasm is by no means dead, for the good people of Annonay have collected from willing subscribers the sum of sixty thousand francs, in order to celebrate in grand style the centenary of the first trial in ascent. On the 6th of June, a statue of the two brothers is to be erected, a copy of the first balloon is to be made to account, and several events with more modern forms of balloons will also be organised. It is curious to reflect that beyond the mere improvements which advances in manufacturing processes have rendered possible, the balloon as an instrument of flight remains the same unwieldy, unmanageable thing it was one hundred years ago.

A correspondent of *Nature* writing from Trinity College, Hartford, U.S.A., gives particulars of a very unusual phenomenon which was experienced there lately. The ground was covered with a hard crust of snow which had fallen two days previously, when a inch fall of light damp snow occurred. A south wind rising some hours later rolled the particles of new snow along, so that they gathered fresh particles as they moved, with the result that the ground was covered for many yards with natural snowballs. These were not spherical, but cylindrical, the longest measuring eighteen in length, and having a breadth of twelve in diameter. This phenomenon is very rare, but has been observed before, notably in New Jersey in the year 1808, when it occurred in day light, so that the whole process could be watched. On this occasion, the snowballs reached a diameter of three feet, some of them leaving a long track, showing the road which they had travelled, until they grew too heavy for the wind to move.

Commenting upon this phenomenon, Mr G. H. Darwin likens it to certain snowballs which he has more than once observed in the British lanes round Bromley. These, made of soft clayey mud, varied in size from a mere pellet to four or five inches in diameter, and it was difficult to imagine that they were not made by hand. But their formation was due to accretion as pellets of mud rolled down hill after rain, their rarity being doubtless attributable to the circumstances that they can only be formed when the soil is in a particular state of stickiness.

Encouraged by the interest aroused by his photographs of animals in motion, and possibly

also by the welcome which he lately received in this country, Mr Muybridge of California has been induced to issue a prospectus of 'a new and elaborate work upon the Attitudes of Man, the Horse, and other Animals in Motion.' The subscription for this remarkable work is twenty pounds sterling a year, and certainly, but not a very extravagant one, when it is remembered what costly appliances are necessary before these pictures can be obtained. The work will be of great interest to artists as well as scientific men, and intending subscribers should communicate with Mr Muybridge, General Manufacturing Company, Publishing Department, 419 and 421 Broome Street, New York.

An extraordinary occurrence was reported by the officers of the steamer *Agula*, which left Weymouth for the Channel Isles on March 30 at midnight. The weather was calm and clear, and the sea was perfectly smooth, until the steamer had proceeded about sixteen miles out, when a heavy sea struck the ship, knocking her on her beam ends, flooding cabins and engine room, smashing skylights and doing other damage for five minutes the greatest terror prevailed among the passengers who were much knocked about. At the end of that time, the sea became calm as it was before. The cause was doubtless due to some underground convulsion upheaving the sea.

The destruction in Great Britain of six ancient manuscripts by fire in the short period of a few months, besides three chambers of a similar character at home and abroad, has once more attracted attention to the causes of these terrible occurrences. The Hon Secretary of the British Archaeological Association displaying them from an antiquarian point of view, has maintained that the fire fires above referred to were directly traceable to the firing of timber beams either beneath the fire places or in proximity to the chimneys, and he advised all owners of similar houses, the loss of which is national as well as personal, to put their houses in order in this respect. From the correspondence that has been published on this topic, we are led to believe that many conflagrations have occurred from quite unsuspected causes. Thus one gentleman relates how he saw the flames of a lady's room to smoulder from the concentration of the sun's rays by the lens of a graphophone which stood on a table by her side. Not long ago we ourselves noticed how a photograph in an optician's shop window showed charred spots through being exhibited, as is often the case, behind a similar lens. Two other independent correspondents record how the wicks in their carriage lamps have been brought to a smoking state by the sun's rays focused upon them by their concave reflectors. Even a cascade of water has been known to focus the sun's rays to burning point. With these facts in view, we can easily imagine how many apparently mysterious fires have happened from similar causes. Knowing as we do that prompt measures taken at the first outbreak of fire may save the premises, we have introduced into those of this Journal half a dozen handy little portable fire extinguishers, termed 'The Rapid,' which seem all that can be desired. They are manufactured by H & J Jarvis, 19 Stobrock Street, Glasgow.

The sadness of recent events in connection with

explosive substances are apt to make us forget their immense commercial importance. Professor Abel, in a lecture recently delivered at Glasgow, gave some figures bearing upon the subject which will surprise those who are not conversant with mining operations. Sixteen years ago, the main fact of dynamite was unknown in this country, and the whole quantity made in other lands amounted annually to about eleven tons. Last year the production in this country alone amounted to eleven thousand tons. The main fact of the more powerful explosive called blasting gelatin is increasing, and it is expected that, as it is one of the most perfect explosives known, it will gradually drive dynamite out of use. It is a comfort to learn that these terrible agents are extremely local in their effects, and that even the explosion of a large quantity would only affect a very limited area. With a vigilant police force, strengthened by the new Explosive Bill, the mischievous use of even small quantities will become a rare impossibility.

We lately made mention of two new methods of manufacturing gas for illuminating purposes. We have now to record the method adopted by the Dixon Patent Gas Company, of 41 Commercial Road, Liverpool. The patentee, Mr. John Dixon, an engineer, of Liverpool, near Melbourne, claims to have discovered an improved gas, which is manufactured chiefly from kerosene, or any of the hydrocarbon oil, with certain other ingredients. In the process of manufacture, the mixtures are put into a tank, and, by a mechanical arrangement, intermittently impacted into heated vessels. The gas, generated in this retort, is conducted by pipes to an hydrone lamp, through which it passes to the burner, and thence to the gasometer, where it is stored for use in the same way as coal gas. The various illuminating gases of Dixon's patent are said to be from twenty-five to seventy-eight standard candles according to pressure and the kind of burner used, while it can be produced more cheaply than coal gas. Arrangements are now being made, we understand, for the introduction of this gas into the Aberdeen-Linn village of Bilsby.

If people were as readily scared by warnings as to the danger of living under unsanitary conditions, as they are by the discovery of a few pounds of dynamite, how much healthier the nation would be. The same cause of danger to life is unusual and exceptional, so they are hard to it, but fever, far more deadly in its effect, is so common, that it goes unheeded. We are prompted to this remark after perusing the Report of one of the medical officers of London concerning a charitable institution where typhus fever has manifested itself. 'The doctor,' says the doctor, 'was at first hard to make, from the dirty condition of the children in the institution. The place was over-crowded with more than three hundred inmates. The rooms were badly ventilated, to such an extent as to be injurious to health, and he was not surprised that typhus fever should have spread in such an atmosphere, and under such neglect of personal cleanliness. It is disheartening to think that in these days, when men of science are working so hard to solve and combat the mystery of miasma, the class which suffer most are, by their ignorance and stupidity, doing so much to propagate

disease. Health, the recently started weekly journal, will doubtless find this a useful subject for its pages.

The *Love's Journal* gives particulars concerning a new fertilizing agent which is much used in the north of France. It seems that many of the farmers there not only cultivate beetroot but also manufacture sugar from it. After this sugar has gone through the necessary process of refinement, a residue is left, which is a coarse kind of molasses or treacle. This, until lately, was regarded as a waste product, but chemistry has pointed out that it contains all the goodness which the beet has in the juice of growth drawn from the soil. So it is once more returned to its original dust, with the result that a fresh crop can be relied upon without any other fertilizing agent. Even wheat will grow upon the ground so treated—a fact that fully suggests the existence of a subtle affinity between the elementary constituents of bread and treacle. But the time during which cereals can be sown under such conditions is very limited, unless phosphate of lime is added to this novel kind of manure.

Although we are not all of us inclined to agree with the old-fashioned folk who continually speak of 'the good old times,' and who admit that there is good in the present, we many of us half regret that modern progress is rapidly shutting out scenes and circumstances which for centuries have formed the themes of poets. The steam engine has long ago invaded the meadow and the harvest field, and the typical sower, reaper and harrow are now confined to the pages of books. Without Britain is not lacking in the restoration, or if imitation as some will call it, our good old country scenes across the Atlantic are far in advance of us, at least it would be so from the last Annual Report of the Census Department of the United States. In this document, we find a list of nearly two thousand agricultural implements making establishments, with a catalogue of the appliances which they manufacture. This catalogue gives a fair idea of the manner in which our farther earth is tilled and tutured by modern machinery. It includes corn planters, cotton planters, grain drills, grain sowers, seed sowers, transplanters, clover crushers, cotton choppers, cultivators, harrows, hoes, ploughs, rollers, fruit threshers, grain cradles, harvesters, hay loaders, horse rakes, lawn mowers, potato diggers, reaper reapers and mowers, corn binders, clover hatters, corn breakers, corn chellers, thrashers, cane mills, cider and wine mills, hay and straw cutters, stalk pullers, stone crushers, steam engines, and scrap evaporators. If necessity has not already been named the mother of invention, America might with some reason have claimed the honour of invention.

## OCCASIONAL NOTES

### NEW SYSTEM OF FIRE ALARMS

The Watch Committee of the Corporation of Nottingham have instructed the National Telephone Company to institute a system of fire-alarms throughout the borough. These fire-alarms accomplish their purpose by means of electricity. An iron box with a glass lens is

fixed into a wall, and inside the box is an apparatus which is connected by wire with the central police and fire stations, to raise an alarm, the glass in front of the iron box has to be broken. This breakage causes a strong spring to plunge forward, throwing a current on the lamp, which releases an armature producing a red disc, indicating the name of the place where the alarm has been given, at the same time, a bell rings in connection with all the firemen's houses and the central station, so that the men receive the alarm at the same moment. The whole arrangement works automatically, and only from three to four seconds is lost from the time the alarm is given. The Company have already placed boxes in fifteen busy thoroughfares, several more will shortly be put in operation. Although the breaking of the glass panes will generally be undertaken by police officers, the public will be at liberty to do so in cases where promptitude is requisite. It may be added that the bell at the fire station continues to ring until a new piece of glass has been inserted in the alarm box. The work is under the personal superintendence of Mr J O Fry, District Manager and Secretary, National Telephone Company, Central Exchange, 3 Bottle Lane, Nottingham. This Company have completed an extensive telephone service for the corporations of Nottingham, Glasgow, Edinburgh, Greenock, Dundee, Aberdeen, Lord's Bradford, H. J. J. Birmingham, Belfast, &c. In Nottingham during last year, forty thousand pounds' worth of property was saved by this speedy means of communication through the telephone. When we add that there is a saving, of several minutes in communication through the telephone as against the telegraph, the special value of the former will at once be apparent.

#### CALIFORNIA.

California, the second State of the American Union in size, at first noted for its mineral wealth, is now rapidly developing its vast agricultural resources. It has great varieties of climate, heat and cold alternating, to the discomfort of the traveller. The fruits of California grow in great profusion, and with so little cultivation, that they seem almost spontaneous. Some of the fruits may not come up to the expectation of the traveller, but there can be no disappointment with the peaches and grapes. All varieties of peaches grow there to the greatest perfection, and the choicest varieties are sometimes a drag in the market. About one hundred thousand acres are at present under vine culture, all of which, when fully bearing, will, it is estimated, yield from forty to fifty million gallons of wine yearly. The product of the 1891 vintage was some million gallons.

The greatest natural wonder in California is the famous Yosemite Valley. While the Falls of Niagara are only one hundred and sixty three feet in height, the highest fall in the Yosemite Valley leaps down sixteen hundred feet without a break, a second lower fall, six hundred feet, and a third, four hundred and thirty four feet—there being eleven distinct falls in the valley.

Every one has heard of the big trees of California. The Big Tree Grove, in Calaveras County, has an area of fifty acres, and contains

one hundred and three trees, twenty of which exceed the enormous girth of seventy five feet. One of these giants of the forest has been lately cut down. To accomplish this required the labour of five men for twenty five days, with pump boring augers and other appliances. When completely covered, two and a half days' labour were required to throw the trunk from its broad base. This tree was three hundred and two feet high and ninety six feet in circumference at the ground, and its annular growth lines showed over three thousand years of life. A house has been built upon this giant stump for theatrical and other entertainments. A roomy house for a small family could thus be constructed on a single stump of these trees. The most celebrated forest of big trees, the Mariposa Grove, is situated about fifteen miles south of the Yosemite Valley, and was ceded by Act of Congress to the State of California for preservation. It contains one hundred and twenty five trees which are more than forty feet in circumference. One tree in the grove, now partially burned at the base, was originally more than one hundred feet in circumference. The bark of the large trees of the Sequoia gigantea is some eighteen inches thick, and is as strong in its texture as a bale of cotton. It is very similar in form and appearance to the Red wood of the Pacific slope, the wood being dark red and extremely light. These giants of the forest were first discovered by a hunter in 1852, and they stand first, as the grandest productions of the vegetable kingdom.

#### A NEW LIFEBOAT.

In spite of the fact that we have a service of three hundred lifeboats and about two hundred and ninety three lifeboats around the shores of the United Kingdom, about one thousand lives were lost by shipping casualties in the year 1890-91. The loss of life during the twenty seven previous years averaged on twenty thousand, the lives saved during the same period by the life boats of the National Lifeboat Institution number twenty nine thousand. We are pleased to notice the recent launch in the river Thames of a life boat on a new principle. This boat is the invention of Mr H. A. T. T. T. of 17 Great George Street, Westminster, and Mr J. B. Hodgson, formerly known on the north east coast as the 'Stormy Petrel,' from his daring acts of bravery in cases of shipwreck and the number of lives he has saved. The boat, as described in a contemporary, consists of a hull formed of two curved tubes of large diameter, meeting at the ends, and thus enclosing an open space, which is fitted with a docking, composed of wood at the centre and of rope meeting at the ends. The docking is placed midway of the depth of the hull, and the water has been below the deck line, the boat is always the right way up, no matter how she is put into the water. The body of the boat is made either of wood or of steel plates, and divided into compartments, which will serve for the storage of provisions. The boat can be either swung from davits or stowed away in any position, and can be run out on rollers and on into the sea. The trials in question were made with two boats, one being steel built and the other of wood, each being thirty three feet in length, with eight feet

six inches and nine feet beam respectively. Both boats were tested in succession for stability, buoyancy, rowing, steering, and sailing powers, and were found by qualified judges present to possess in an eminent degree the requirements of a safe and reliable lifeboat.

#### ARTIFICIAL INCUBATORS

Those who have turned their attention to the use of the artificial incubator are aware of the very narrow line that separates success on the one hand from failure on the other. It appears that the possibilities of artificial hatching have recently attracted some attention in the United States. It has been found that as the use of the incubating machine is increased, the percentage of hatch is decreased. This is owing to the fact that an inclosed surface of four square feet can be so heated that there is no apparent variation of temperature in any part of it, but when there is an increase in the surface to be heated, there is a decrease of temperature in the outside edges. An authority on the subject, Professor J. H. Henshaw, says that a trustworthy regulator is indispensable to every incubator, and that uniformity of temperature is the most important condition of success.

The result of Mr. Henshaw's own experience is that eggs hatch equally well at any point between one hundred and two and one hundred and five degrees, or if the heat varies from ninety-eight to one hundred and one degree, without remaining long at the extremes. Few eggs will start below one hundred and two degrees, none at one hundred, and for the first half of the incubating period, few will endure one hundred and six degrees many hours. But all will go well, should the heat be kept within the safe lines, between one hundred and two and one hundred and five degrees. In Henshaw's incubator (115 Southwark Street, S. E.) this has been well provided for, the use of the regulator precluding the possibility of an injurious rise of temperature. Whenever the heat over the eggs exceeds one hundred and six degrees, the expansion of a capsule raises a valve, that lifts a damper, which allows the heated air to escape and lowers the temperature. The capsule again contracts on the fall of the temperature, when the damper descends, and again runs the temperature of the water to the required degree.

#### TRANSPORTING LIVE FISH

From the United States we hear of a novel method adopted for the transport of live fish, which seems to have been entirely successful. We learn that one of the palace cars belonging to the Fish Commission recently started for California with its strange freight of eighteen thousand young fish. The car in which the human passengers and fish lived for the time, resembled a modern sleeping car, with compartments at each end, but in place of seats on each side there were ledges about three feet high, in which were placed the tin fish tanks. As the motion of the train might have drenched the water about, and so destroyed the fish, a novel device was adopted for avoiding this. About twenty fish were placed in gallon tin pails,

which were put in the tanks, and the latter were filled up with water. The motion of the car was found to be favourable for the circulation of air in the water, thus keeping it fresh. Every eight hours the water was renewed, and any dead fish were carefully removed by the attendants. The first halt was made at St. Louis, where supplies of fish were left for applicants in Missouri and Arkansas, and from this point fish were sent all over the States at the expense of the company.

#### CHICAGO PIG PACKING

This enormous business, says a contemporary, carried out with the most elaborate mechanical contrivances, shows from returns lately published to have greatly decreased in scale of late years, for while in 1878 it was no less than seven million four hundred and eighty thousand hogs were killed and packed, in 1881-2 only five million seven hundred thousand were so used for the business. These figures are for winter packing only. The summer packing is somewhat less, the last returns showing only three million two hundred and twenty five thousand as against five million three hundred and twenty three thousand in 1880. As a natural result, prices have gone up considerably, and 1882 shows seventeen per cent above 1881, and forty four per cent over 1880—two hundred and sixteen per cent above 1878. Present prices are thirty per cent above the average of the summer prices of the past seven years. Comparison is made between the value of a barrel of pork and that of a certain quantity of wheat. Thus, in 1879, a barrel of pork was of equal value to nine and a half bushels of wheat, in 1880, fourteen bushels of wheat were required to buy a barrel of pork, in 1881, fourteen and a half bushels of wheat, in 1882, sixteen and a half bushels of wheat, while at the present moment seventeen and a half bushels of wheat are the equivalent of one barrel of pork. Those in vellers who go to the States for pleasure should never miss seeing the pig-killing establishments in Chicago and Cincinnati. The mechanical ingenuity and exactness of all the appliances for putting the poor pig out of his earthly existence, and the rapidity with which he is prepared for the use of a hungry world, is a wonderful sight to behold.

#### CANADIAN DAIRYING

Cheese and butter factories are rapidly on the increase in Quebec. The Minister of Agriculture in the Dominion has issued a Report, in which it is stated that there are now in the province of Quebec two hundred and eighty cheese factories, forty seven butter factories, and twenty milk cream and butter factories combined, which shows an increase of no less than one hundred and fifty five establishments during the year. This is no doubt correct, for the vast masses of hard stock, partly from importation, but more especially from native breeding, must have an outlet for the enormous amount of milk produced, for which the sparse population of the province offers but a slight demand in its natural state. Canada is bound, in a few years, to be no large an exporter of butter and cheese that consumers in England will welcome the material

increase to the home supplies, as the price now paid for butter and cheese is fully double what it was thirty years since. In 1860-1 & 2, butter was ninepence per pound, cheese sixpence, meat eightpence. Competition with the States, and particularly with Holland, must have but one result, and that is a great reduction in the price for these necessaries. As to the effect it will have on the English producer, possibly it may actually do good, from the simple fact that it will be found more profitable to the English grower to turn his fields well on new milk, than to make butter and cheese. The stakes at issue are large, and the future of our own country, agriculturally, depends much on what success the Canadian and States dairymen meet with in their cheese and butter making. As to the price of meat in Canada, it is stated that during winter, in Quebec a fat calf could not be purchased for less than fifty dollars, and eight dollars had to be paid for a fat lamb.

#### IMPROVED RAILWAY SIGNALING BY NIGHT

In a discussion on Dilemma, or colour blindness, which appeared in the *Daily News* some little time back, it was stated that a new system of night railway signalling would shortly be introduced by which accidents resulting from the inability of the engine driver to distinguish a red from a white light—a visual defect more common than it generally supposed—would be rendered an impossibility. Mr. Clemons, the railway engineer, and our correspondent, Mr. A. Tuer, of Leadenhall Street, the joint inventors of the new system, propose using at night the ordinary dry semaphore signal, with the difference that the arms are to be boxed in and illuminated, their position as by day, and not the colour, signifying whether the line is blocked or clear.

#### THE VIOLET BANK

'Tis was the first time Lucy had seen sweet violets.'

First the spring with fell com' thence  
Filled the waiting world with sweetness,  
For the tree had burst in beauty,  
Ready for their summer duty,  
Weaked a fair haired child along  
Where the river sang its song.

And her eyes were clear with joyance;  
Not a shadow of annoyance  
Dwelt upon her face, unshaded  
By the memory of the past,  
Nor regret for pleasures faded,  
Or for joys that would not last  
As one dreameth a sweet dream,  
So she walked beside the stream.

Suddenly a perfume stole  
With delight into her soul,  
And above her, on a height  
(Oh, what exquisite delight!),  
She beheld, with joy unspoken,  
Something never seen before  
(Just a sign, and seal and token  
That the spring had come once more).

Yet in wondering she had never  
Seen such flowers beside the river.

Then they grew in sweet profusion,  
While with eager, glad confession,  
Down she bent to pluck the treasure  
All her own—with inner pleasure,  
Knowing every fragrant bloom  
Was she had it in her home.

Then, with guilty face, looked round,  
Lost some little friend or lover  
Wandering by, should thus discover  
What she, lucky child! had found.

And as years passed I over the main  
(Lost with change and sorrow I dare),  
Still she came, with tender pleasure,  
To the bank beside the river,  
Gathering without aim or measure  
Every spring these flowers that never  
Faded with odorous breath to rest her,  
But with March came forth to meet her.

Years bid I the woman older,  
Older felt the world was older,  
Since those sunny days gone by,  
Yet her heart beat faithfully  
To the home she long had left,  
To the place by change lost  
And she said 'The body is growing,  
All the world for spring is turning,  
I shall go and see again  
That dear violet bank, whose sweetness  
Never is hidden by Time's scimitar  
Though my heart may throbb with pain.'

And she went, but found no trace  
Of that well remembered place  
All was changed, the bank was gone,  
And the river path no more  
Wound about it as of yore,  
And of violets there were none!

Ah! in that short life, how often  
Memories rise to soothe and soften  
Old beside the well known stream,  
Does she gather, in a dream,  
Violets as fresh as ever  
From the bank above the river.

The *Commissioners of Chambers's Journal* beg to direct the attention of CONTRIBUTORS to the following notice.

1st All communications should be addressed to the Editor, 34 High Street, Edinburgh.

2d To ensure return in case of multiplicity, postage stamps should accompany every manuscript.

3d Manuscripts should bear the author's full Christian name, Surname, and Address, legibly written, and should be written on white (not blue) paper, and on one side of the leaf only.

4th Offerings of Verse should invariably be accompanied by a stamped and directed envelope.

Unless Contributors comply with the above rules, the Editor cannot undertake to return undeposited papers.

Printed and Published by W. & R. CHAMBERS, 47 Paternoster Row, London, and 340 High Street, EDINBURGH.

## OLD CITY TAVERNS

It cannot be needed as a condition under which authors gain most inspiration, such an abundance of that luxury has been bestowed upon them, in one direction, ever since the time of Shakespeare, that whatever hardships they may have endured in private life, they have had little cause to complain of their public 'entertainment.' So closely, indeed, have the old coffee houses, inn, and taverns in the City of London become associated with the names of men of letters, so enlivened by the anecdotes told of these eccentric people, of their sayings and doings, their witicisms and their epigrams, which have reached us from these snug retreats, that no biography of a literary man of any note who has lived any time during the last three hundred years, would be complete without some reference to more than one old City tavern. They were the 'houses of call' for those who had a fund of learning and were eager to exchange ideas. The surroundings were eminently characteristic of men who placed erudition before every other 'circumstance' by which our lives are governed. Here they could 'feast' over each other's words, and serve them up *réchauffé* with a bowl of punch. The floors were matted, the pipes were of clay, and the seats were wooden high-backed benches. This may not be the modern notion of comfort; but to men so conservative by nature, a warm room and a curtained compartment, where Shakespeare and Ben Jonson had sat in seats of honour, was an ample compensation for the absence of showiness and ease; and the gloom and mystery of the courts and alleys in which these old taverns were invariably found, was perhaps the secret of their attraction to men of a thoughtful and retiring disposition. New faces were seldom seen, it was a sort of club-life, in which the choice of companionship was made in the manner naturally adopted by 'birds of a feather,' flocking in taverns, as in trees.

Dr Johnson had the highest opinion of a tavern, and Boswell has declared that he has heard him assert that a tavern chair was the throne of

human felicity. 'As soon,' said Johnson, 'as I enter the door of a tavern I experience an oblivion of care and a freedom from solitude. When I am seated, I find the master courteous, and the servants obsequious to my call, anxious to know and ready to supply my wants. Wine there exhilarates my spirits, and prompts me to free conversation, and an interchange of discourse with those whom I most love, I dogmatise and am contradicted, and in this conflict of opinions and sentiments I find delight.'

Up a dim court—from the time of James I until nearly the end of the last century—there stood out of Fleet Street one of the most noted taverns ever built in the City of London. It occupied the spot behind a quiet looking goldsmith's shop between Temple Bar and the middle Temple Gate. It was called the *Devil* tavern. The church of St Dunstan's was nearly opposite, and the sign of the tavern was St Dunstan pulling the Enemy of Mankind by the nose. In the time of Ben Jonson, who has given a lasting reputation to the house, the landlord's name was Simon Widdoe—the original of 'Old Sir Simon, the King,' the favourite ear of Squire Western in *Tom Jones*. The great room was called 'The Apollo.' Here Jonson lorded it with greater authority than Dryden did afterwards at *Wills's*, or Addison at *Belton's*. The rules of the club, drawn up in the pure and elegant Latin of Jonson, and placed over the chimney, were, it is said, 'engraven in marble.' They are described in the *Teller* as being 'in gold letters.' This account agrees with the rules themselves, the tablet being still preserved in the banking house of the Moore Child, as well as that interesting relic of the tavern—the bust of Apollo. The head, modelled from the Apollo Belvedere, kept guard over the door of the 'club.' This is the tavern mentioned by Pope.

And each true Briton is to Ben so civil,  
He swears the Muse meet him at the Devil.

And Swift in one of his letters to Stella says: 'I dined to-day with Dr Garth and Mr Addison

at the *Devil* tavern near Temple Bar, and Garth treated.

It is more with the *Mitre* than with the *Devil* tavern that Dr Johnson's name is associated. ■ was there that Johnson said to Ogilvie, in reply to his observation, that Scotland had a great many noble prospects: 'I believe, sir, you have a great many, Norway, too, has noble wild prospects, and Liplon is remarkable for prodigious noble will pique is, but, sir, let me tell you, the noblest prospect which a Scotchman ever sees is the high road which leads him to England.

■ was at this tavern that the idea of the tour to the Hebrides was first started, and there, at their 'old rendezvous,' Goldsmith often supped with Johnson and Boswell. The original *Mitre* was of Shakespeare's time. It was pulled down in the year 1820 by the Messrs Howe, in order to make their banking house, and in the same way Messrs Child have recently increased their 'accommodation' by building upon the spot where once stood the *Devil* tavern. Both these taverns are thus blotted out. This is truly a commercial age! The old City churches are falling fast, and counting houses are rising up where their old chimneys (now raised for ever) were once heard, and even the old City church yards are slowly disappearing from sight. What, then, will the old City be five hundred years hence? Hurd by is the *Rainbow* tavern, now a first class dining house, which was indicted in former times for the sinners of selling coffee.

There is another old City tavern where Dr Johnson and Goldsmith often sat down together over a snug dinner, a tavern in Wine Office Court, called the *Old Cheese Cheese*. Passing along Fleet Street and glancing up the court, those magic words seem to take up all the space in the distance, as completely as though they were being glanced at through a telescope, and if you follow the instincts of your nature, you will dive down the telescope towards the attractive lamp above the door and enter the tavern. The customary pint of stout, in an old pewter, will be placed before you if your taste be that way, and when you have finished your chop or steak, or pudding, as the case may be, there will follow that 'speciality' for which the *Cheese Cheese* is principally noted—a dish of bubbling and blistering cheese, which comes up scorching in an apparatus, resembling a tin of Everton toffee in size and shape.

It was the same when frequented by Johnson and Goldsmith, and their favourite seats in the north east corner of the window are still pointed out. Nothing is changed—except the waiters in course of nature—in this conservative and cozy tavern. If Goldsmith did not actually write parts of the *Poor of Waterford* in that corner, he must have thought out more chapters than one while seated there. He lived in Wine Office Court, and here it is supposed the novel, begun at Canonbury Tower, was finished. 'I reserved

one morning,' said Dr Johnson, according to Boswell—a message from poor Goldsmith that he was in great distress, and, as it was not in his power to come to me, begging that I would come to him as soon as possible. I sent him a guinea, and promised to come to him directly. I accordingly went as soon as I was dressed, and found that his landlady had arrested him for his rent, at which he was in a violent passion. I perceived that he had already changed my guinea, and had got a bottle of Madeira and a glass before him. I put the cork into the bottle, desired he would be calm, and began to talk to him of the means by which he might be extricated. He then told me that he had a novel ready for the press, which he produced to me. I looked into it, and saw its merits, told the landlady I should soon return, and having gone to a bookseller, sold it for sixty pounds. I brought Goldsmith the money, and discharged his rent, not without raising his landlady in a high tone for having used him so ill.

Not less interesting than the *Cheese Cheese* is that favourite resort of literary men for nearly three hundred years—the old *Cock Tavern*, or, as it was first called, the *Cock Alehouse*, which faces the Middle Temple Gate, and has been famous for its chops and steaks, its porter, and above all, its stout, ever since it was established. Whilst the Plague was raging in London in 1665, the master shut up his house and retired into the country. The following advertisement is still extant: 'This is to notify that the master of the *Cock and Bottle*, commonly called the *Cock Alehouse*, at Temple Bar, hath dismissed his servants and shut up his house for this Long Vacation, intending (God willing) to return at Michaelmas next, so that all persons whatsoever who have any accounts with the said master, or farthings belonging to the said house, are desired to repair thither before the 8th of this instant July, and they shall receive satisfaction.' In our time, this tavern has been immortalised by Mr Tennyson in his poem beginning,

O plump head waiter at the *Cock*

But 'Will Waterford,' to whom the verses are addressed, has ceased 'to pour the grided floor' for some years now, and if there are any other changes in the old room, they are very slight. The walls are now only partially lined with wainscoting, and the silver tankards of special customers are no longer hung up in glittering rows in the bar. The old carved chimney piece—of the age of James I—however, still remains, and the curtained boxes retain the same cosy appearance, and still that

Half hour about  
The waiter's hands that reach  
To each his perfect pint of stout,  
His proper chop to each.

At the present hour, the old tavern, viewed from the opposite side of the road in Fleet Street, looks as if it occupied an underground position, as if it were buried somewhere behind those

boardings in the midst of ruins. The original entrance—a long sanded passage, more like a tunnel than ever now—still stands, but it will soon be pulled down, though the tavern, it is said, being sufficiently far back from the road not to interfere with the widening of Fleet Street, is destined to remain a famous landmark in the vast field of literature.

May this rumour prove correct? For most of the taverns which stood in the neighbourhood of Fleet Street, Newgate Street, Ludlow, and Cheapside, have become a mere matter of history, without in some instances even a stone to denote their original site. The famous gilded Cock which stood for so many years over the entrance, disappeared not very long since, when, it is supposed, by some ardent lover of old London curios.

Although the Cock was well known in the latter half of the seventeenth century, there is very little allusion to it in contemporary literature. This may be because it was considered an ale house, and not a coffee house. However, Pepys records going, there in 1664, and eating lobster until midnight. Fiddling was fond of the old tavern, as were Smollett, Savage, Goldsmith, Boswell, and Cowper. The standard dishes at the Cock are still 'chop and chop to follow,' or a steak either 'small,' 'dinner,' or 'point,' followed by a kidney 'sniped'—that is to say, broiled whole, as is to keep in the gravy—and toasted cheese. The oil cellar of famous port wine was sold by auction towards the end of last year, but pun is still served in pint tumblers according to ancient usage. An old Cock token of 1668 is still shown, and may be one of the 'farthings' alluded to in the advertisement above quoted.

The *Chapter House Tavern*, at the corner of Chapter House Court, Paternoster Row, fre quented principally towards the end of the last century by bookellers, authors, and editors, has not yet been removed. There it still stands, a long dark building, some three stories high. It can be reached by a narrow entrance into the court from St Paul's Churchyard, or under a low archway from Paternoster Row. The coffee room, on the ground floor, where the literary 'judges' sat, has been recently changed into a bar. But the windows and the walls are the same, and the gloom which surrounds it now is little less than it was a hundred years ago. The ceilings in the tavern have such an unimposing elevation, that even though, when entering, one is made conscious of a precipitate descent to a level of more than a foot below the court outside, one is not surprised into a confusion that the room has gained in loftiness in any marked degree. In fact, the circumstance is dispiriting, and the gloom which hangs about the exterior adds to this peculiar sense of depression. From every point the shadows seem to have gathered about this tavern, and above them all there looms the shadow of St Paul's.

In the first number of the *Connoisseur*, in 1754, this place is referred to. 'And have my publishers would not forgive me,' says the writer, 'was I to leave the neighbourhood without taking notice of the *Chapter Coffee house*, which is frequented by those encouragers of literature and—as they are styled by an eminent critic—"not the worst judges of merit," the bookellers.' It was another

favourite tavern of Goldsmith's, and the place where he sat was, until the alterations took place, panted out to visitors. It was to this tavern also that Chatterton frequently went. 'I am quite familiar at the *Chapter Coffee house*,' he wrote to his mother, 'and know all the gentlemen there.'

On the side nearest to Paternoster Row, about the centre of Newgate Street, there is still standing the *Salutation* tavern, formerly known as the *Salutation and Cat*. This old tavern, like the Cock, is reached by passing down a tunnel and through a bar and across a passage, when the coffee room begins to come in sight. This room is divided into two apartments by pillars, and the one most distant from the door is on a lower foundation by some feet. The efforts which are made to preserve the manners and customs of this tavern are severe, but when the traditional snuff box is presented to you, after you have paid your bill, the privilege of snoring at the head waiter seems as if it had lost half its charm. It is difficult to realise now how Coleridge could have found the tavern a pleasant retreat when suffering from fits of melancholy, and yet it was here that Southey found him, and tried to rouse him from his semi-mane madness.

Cheapside and the Poultry were at one time as famous as Fleet Street for their literary taverns. The *White Horse* in Friday Street makes a conspicuous figure in the *Merry Conceits* of *George Peck*, one of the poets and playwrights of Elizabeth's reign, and the name is still attached to a gin palace of the modern type, and there was another tavern which is even more celebrated—at the corner of Friday Street and Bread Street—called the *Mormon* club, where for Walter Raleigh, who instituted it, and where Shakespeare, Beaumont and Fletcher, Jonson, and many others, met.

Seals of poets dead and gone,  
What hymn have ye known,  
Happy field or merry owner,  
Cheer than the *Mormon* tavern!

So sang Keats. Nor must the *Queen's Arms*, another tavern in Cheapside where this poet once lived, be forgotten—where he wrote his sonnet on *Chapman's Homer*, and all the poems in his first volume. This tavern, like most of the rest of the old taverns in Cheapside, has disappeared, and the second floor, which Keats occupied—stretching over a passage leading to the entrance—is now a warehouse, with nothing more ornamental about its frontage than a rusty crane.

In Great Titchmarsh, between Small Alley and St Michael's Lane, stood the *Boar's Head* tavern, commemorated by Shakespeare. It was destroyed by the Great Fire, but it was rebuilt almost immediately afterwards, nor was it finally demolished—in order to make space for new approaches to London Bridge—until 1831. The back part of the house looked upon the burying-ground of St Michael's, Crookind Lane. The statue of William IV nearly marks the site. In the reign of Richard II, a tenement, called the *Boar's Head*, in Eastcheap, was in possession of Walter Mordaunt, stockfish monger of London. In the time of Henry IV there was, according to Stow, no tavern in Eastcheap. Shakespeare alone

refers to this tavern. After the Great Fire, it was rebuilt of brick, with its door in the centre, a window above, and then a horse head cut in stone, with the initials of the landlord (F T), and the date (near the snout) of 1668, which may still be seen in the Guildhall Museum. Boswell says: 'I mentioned a club in London at the Lion's Head in Kew-street, the very tavern where Falstaff and his joyous companions met, and the members of which all assume Shakespeare's characters. One is Falstaff, another, Prince Henry, another, Parolphe and so on.' To which Johnson replied: 'Do not be of it, sir. Now that you have a name, you must be careful to avoid many things not fit in themselves, but which will lessen your character. Thus, every man who has a name must observe. A person who is not publicly known, may live in London as he pleases, with out any notice being taken of him, but it is wonderful how any person of consequence is mischieved.' In his story, 'A Night at the Poor's Head Tavern,' Goldsmith says: 'Here, by a pleasant fit, in the very room where old Sir John Falstaff cracked his jokes, in the very chair which was sometimes honoured by Prince Henry, I sat and ruminated on the follies of youth, wishing to be young again, but was resolved to make the best of life while it lasted, and now and then expressed pret and pleasant times to other.' For, careful of the notice committed by the Great Fire—just as Falstaff did—Goldsmith found that he sat in the very tavern frequented by Falstaff.

When the old City taverns with a literary 'flavour' stopped short in their outward course it would be difficult to decide which was out of Thames Street, in Three Cranes Lane—'so called,' says Stow, 'not only of three cranes at the tavern door, but rather of three cranes of timber placed on the watery wharf by the Thames side, to crane up wines'—that the *Three Cranes* so famous as early as the reign of James I., and frequented by Ben Jonson and the wife of Jonson. In *Archidemo's Fair*, Jonson says: 'These pretenders to wit! Your *Three Cranes*, *Mitre*, and *Mermaid* men! Not a corn of truth will not a grain of right mustard among them all. The mention of this tavern by many head of the *Donny Black Bear*, in *Archidemo's*, is frequent. 'Nor is there such a wine,' says Giles Goose, '—drinking off a cup of his own sack—'at the *Three Cranes* in the vintory, to my knowledge.'

There is no sign of this tavern in Thames Street now. The large modern warehouse—still called the *Three Cranes*—standing upon the site formerly occupied by the old warehouse and tavern, with its lofty frontage towards the Thames, seems to foretell in its very face of how these venerable landmarks in the City of London must of necessity soon be swept away. They are crowded out in this neighbourhood, as elsewhere, in dark alleys, up steep lanes and narrow courts, where still a few of them hold out an almost ludicrous resistance against the march of time. Some of them are propped up by wooden beams, resembling crutches, against which they lean like those decrepit couples who have the appearance of being on their last legs, while others are supported on each side by houses which are only in a slight degree less weak and tottering. These old City

taverns are monuments of their own antiquity and fame, and when the last song retreats has grown dark,

We know not where is that Prometheus bent  
That can its light renew.

## ONE FALSE, BOTH FAIR;

OR, A HARD KNOT

By JOHN R. BARWOOD

### CHAPTER VIII.—FROM ROUNCE AND FORTIFY.

'My dear, I shall not stay long away. I dislike leaving you here alone, and besides, these new-fashioned gentleman are not much to my taste, and one meets the oddest people, perhaps because it is out of doors. But I shall write a poem of my coming to her, and so.'—

Now, Celina was Her Grace the Duchess of Sutherland, and Lady Barbara had always highly approved of that handsome and fine young lady while yet in meditation fancy free, and always took rather unbecoming credit to herself for having been instrumental in placing the ducal coronet on her well-shaped head. 'Poor dear Sutherland ought to thank me for having helped him to such a wife,' was a not unjust remark of Lady Barbara. There were other much nobler, less distinguished, who proudly owed a grudge to Lady Barbara for what she had done. It was looking in her young friend the big, matrimonial prize of the season, but at any rate the Duke, who was plump and short, and some times amiable, by strangers who came to see his model farm and pedigree cattle, for his own bulk, so naturally did gawk and belch out him, had seemed a hands fit to do honour to his high dignified and simple means.

'I shall not be dull in the least, I don't mind it at all, dear Lady Barbara, the young mistress of Leinster House had looked gently, and then she had been left to her solitude in that vast mansion of a mansion that was now her home. Of course Lady Leinster had been invited. She was always invited. Cards and notes, so to speak, must sit at her door, but it was impossible that she should, at this comparatively early stage of her widowhood, mix in general society. She stayed, then at home, while Lady Barbara sallied forth to Willow Reach, as the Duke's pretty Thames-side villa bore name, where very anxious persons were expected to gild the assembly by their presence.

'I shall not be dull, see, I have the Laureate's new poem, only just begun, the young lady had said, as she took the book in her hand, just before the start of the late Marquis set forth on her fatal errand. But hours had elapsed, and Lady Barbara had been absent for a long long time, and the summer sun was drooping in the sky, and very, very few lines of the poetry had been perused by the fair young creature in black, whose mourning garb and utter loneliness seemed almost touching, when contrasted with the pomp and state and grandeur that surrounded her. She took the book again and again in her white hand and glanced at its pages, but her mind strayed far away—so it seemed—from the lines before her, and she laid down the volume with a sigh and remained lost in thought.

'A person from Pounce and Pontifax, My Lady, with business papers of importance. Would your Ladyship please to see him?'

The lady lifted her book again and it was almost palpably that she made answer: 'Certainly not. I am occupied. I do not wish to be disturbed.'

The man in sable raiment with oriental obdience, but before he had traversed the wide expanse of Brussels carpet that intervened between him and the door, the lady seemed to change her mind: 'Stop, Pounce,' she said languidly. 'I will see this person, since my lawyers have sent him.'

The clerk of Messrs. Pounce and Pontifax was ushered in. In some respects the man did look the very type of clerkhood. He wore the latest garments, tight-fitting, neither new nor old, of black or 'sublim' hue, as our old Oxford Latin statute used to phrase it, and his shirt collar was very white, and his pale wrists tight and trim. His arms under one arm some bundles of papers and parchment, tightly tied with red tape, and in one hand, barometer like, he bore a blotting.

The young lady looked up with but a dull curiosity as the man made his bow. She had expected to see a quiet, unobtrusive person of the male sex, anxious to do his errand and to take his leave. To her surprise, the languid, loose of her soft blue eyes was met by the steady gaze of wicked eyes, as bright, as, brighter than her own, eyes full of fire and full of malice, half threatening, half mocking. Never, surely, did family a hint of such high smiling as the misanthropic frown of Pounce and Pontifax send, to such a slight, such a clerk. He had not impressed the lady as unfavourably. But then his bearing had been firm and steady, and his look-downward. Now, there was a change in the manner, and he had somewhat of the air of a reckless buccaner of earlier days, trailing his schooner's deck, in silken scarf, and with gold and silver and pearls ostentatiously displayed about his person. So startled was the lady, that, in sincere alarm, she rose from her seat and moved towards the bell. The angular emissary of Pounce and Pontifax barred her way.

'No, no, My Lady Marchioness,' he said, in that strange voice that belonged to Chinese Jack, and which provoked or perplexed those who heard it, 'you must not ring the bell—it has not now. Sit down again, I beg, and let us attend to business. Come, we have no time to lose. Lady Harbarn may come back. I lost hours in getting myself fit to act the character, when once I saw that the coast was clear.'

Scared and amazed, the young mistress of Leonminster House shrank back from the audacious eyes and dauntless front of this extraordinary intruder. She hesitated a moment, and then meekly resumed her seat. What, in deed, was she to do? She could not reach the bell. To call aloud was useless, in that vast catcomb of a house, where all ordinary sounds were deadened by space. Besides, was there anything to justify a shriek for aid? The man was not rude, only odd and peremptory. Pounce and Pontifax had certainly made choice of an eccentric envoy, but there he was. One thing

puzzled her. Where had she seen those bold eyes before? She had no recollection of the man, with his close-cut hair and bushy beard and face framed by countless lines, none of those daring, defiant eyes, with their look of rough admiration and keen scrutiny, odious both.

'And now, my business,' said this phenomenal clerk.

'Will you not—' said she, whom he had dressed, as she timidly motioned towards a chair.

The man took the seat tentatively enough. 'Your husband's father, My Lady, has done me the honour to ask me to be seated at Castel Vawr often enough,' he said drily.

'You know Castel Vawr, then?' faltered out the bewilderment.

'Better than your Ladyship does. I know most things, and what I don't know, I have a knack of finding out,' was the same cool answer. 'So now, as I said to business. We may as well have the colour at the outset—*vous savez* a *saute*—it once. I don't come from Pounce and Pontifax in the least—not I. Never was a driver like rubbish, those *voilà* properties,' added—'Juncus,' at the red tapet puckets and the blue big that lay beside him on the floor, contemptuously. 'I bought it a law student's in Curator Street. The make-up wasn't bad, though,' he added boastfully.

'Not from Pounce and Pontifax?' Then, as, I must have—' said the lady, as she half rose, but somehow she was held by the burning eyes that met her.

'In fact that I should—' and have the intruder turned out? said the man laughingly. 'No, Lady, I remember that you must do with one who has looked death in her ugliest shape, in the face for thirty years, and who is used to frowns from more potent persons than even a Marchioness. No, nor am I a thief, he added rapidly, as he noted the expression of her face. 'Not a bit of that. I am no robber. I am no clerk. I am simply an unaccredited plausipolentary, and come on my own account, not on that of those miserable complais of talk of cost, Pounce and Pontifax.'

Next to his sneering tone, the most remarkable feature in the conversation of Chinese Jack certainly was, that at one time the man seemed to be a perfect gentleman, and a moment later, the dishevelled, reckless adventurer. She could not eye him with timid wonder as he went on.

'I know I waste time, and how precious the minutes may be,' he said, with an evident enjoyment of the situation and of the fact that he was master of it. 'Yet I do waste them. You and I, My Lady, must be friends or foes. I have too much to be neglected.'

'I—I do not understand—you come from Castel Vawr,'ammered the lady.

'From an older land than even the Welsh Marches—from Alexandria—from Egypt. I saw a good deal, and heard a good deal, and picked up a few trifling secrets too, when you and I came home together by the good ship *Cyprus*, My Lady.'

'Secrets—the *Cyprus*—in what way, pray, can secrets concern me?' demanded she laughingly, and with no perceptible tremor in her voice.

Chinese Jack eyed her with a composure not

wholly devoid of a hidden sense of amusement, as though she had been a child indeed. But he was quite grave when he said: 'Not directly, of course, My Lady Marchioness. But—you have a sister.'

'I have indeed. Can you—in it possible that you have been sent to me—by her?' The voice in which the question was asked was not a steady one.

Chinese Jack interrupted in a little laugh. 'Not I, My Lady, he said, so slowly as if he were weighing every word. 'Although, you see, I might have been. You see, My Lady, the likeness is so very remarkable between you two young things—between you, pardon for the freedom—that it would not take much to turn the tables, to put the other one in your place, and have your Ladyship out in the cold. A pity, too! This is a grand house, and the castle, to my fancy, is a finer, and then the splendid income, and the rank, and the power, and the station, and the being flattered and courted by high and low. It would never do to lose it all, My Lady. It would be heart-breaking, to be outgeneralled, because the competitor held better cards, or played them better. And yet that will happen, be sure of that, if you allow me to go over to Miss Cora's side, and—'

'Hill, sir! I forbid you to address me thus! I forbid you to drag my dear, unhappy, mangled sister's name into your talk. Leave me, this instant—or—' She stopped, trembling. She had risen to her feet, and in her passionate indignation the silent tears nearly laughed. It was not a joyous laugh, the quiet, painful chuckle of a fiend, rather. That laugh, and the expression of the man's mocking eyes, checked her anger, and, with a sob, she sank helplessly back in her chair.
